[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

[ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated with a non-directory file.

The *utimensat*( ) and *utimes*( ) functions shall fail if:

[EACCES] Search permission is denied by a component of the path prefix.

33597 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
33598 argument.

33599 [ENAMETOOLONG]
33600 The length of a component of a pathname is longer than {NAME_MAX}.

33601 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

33602 [ENOTDIR] A component of the path prefix names an existing file that is neither a
33603 directory nor a symbolic link to a directory, or the *path* argument contains at
33604 least one non-<slash> character and ends with one or more trailing <slash>
33605 characters and the last pathname component names an existing file that is
33606 neither a directory nor a symbolic link to a directory.

33607 The *utimensat*( ) and *utimes*( ) functions may fail if:

33608 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
33609 resolution of the *path* argument.

33610 [ENAMETOOLONG]
33611 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
33612 symbolic link produced an intermediate result with a length that exceeds
33613 {PATH_MAX}.

33614 The *utimensat*( ) function may fail if:

33615 [EINVAL] The value of the *flag* argument is not valid.

33616 **EXAMPLES**

33617 None.

33618 **APPLICATION USAGE**

33619 None.

33620 **RATIONALE**

33621 The purpose of the *utimensat*( ) function is to set the access and modification time of files in
33622 directories other than the current working directory without exposure to race conditions. Any
33623 part of the path of a file could be changed in parallel to a call to *utimes*( ), resulting in unspecified
33624 behavior. By opening a file descriptor for the target directory and using the *utimensat*( ) function
33625 it can be guaranteed that the changed file is located relative to the desired directory.

33626 The standard developers considered including a special case for the permissions required by
33627 *utimensat*( ) when one *tv_nsec* field is UTIME_NOW and the other is UTIME_OMIT. One
33628 possibility would be to include this case in with the cases where *times* is a null pointer or both
33629 fields are UTIME_NOW, where the call is allowed if the process has write permission for the file.
33630 However, associating write permission with an update to just the last data access timestamp
33631 (which is normally updated by *read*( )) did not seem appropriate. The other possibility would be
33632 to specify that this one case is allowed if the process has read permission, but this was felt to be
33633 too great a departure from the *utime*( ) and *utimes*( ) functions on which *utimensat*( ) is based. If
33634 an application needs to set the last data access timestamp to the current time for a file on which
33635 it has read permission but is not the owner, it can do so by opening the file, reading one or more
33636 bytes (or reading a directory entry, if the file is a directory), and then closing it.

33637 **FUTURE DIRECTIONS**

33638 None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

This function is marked LEGACY.

The normative text is updated to avoid use of the term ``must'' for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The LEGACY marking is removed.

The *utimensat*( ) function (renamed from *futimesat*( )) is added from The Open Group Technical Standard, 2006, Extended API Set Part 2, and changed to allow modifying a symbolic link by adding a *flag* argument.

The *futimens*( ) function is added.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0220 [63,428], XSH/TC1-2008/0221 [278], XSH/TC1-2008/0222 [324], XSH/TC1-2008/0223 [306], and XSH/TC1-2008/0224 [278] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0140 [591], XSH/TC2-2008/0141 [817], XSH/TC2-2008/0142 [485], and XSH/TC2-2008/0143 [817] are applied.

NAME

fwide — set stream orientation

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

int fwide(FILE *stream, int mode);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *fwide*( ) function shall determine the orientation of the stream pointed to by *stream*. If *mode* is greater than zero, the function first attempts to make the stream wide-oriented. If *mode* is less than zero, the function first attempts to make the stream byte-oriented. Otherwise, *mode* is zero and the function does not alter the orientation of the stream.

If the orientation of the stream has already been determined, *fwide*( ) shall not change it.

CX The *fwide*( ) function shall not change the setting of *errno* if successful.

Since no return value is reserved to indicate an error, an application wishing to check for error situations should set *errno* to 0, then call *fwide*( ), then check *errno*, and if it is non-zero, assume an error has occurred.

RETURN VALUE

The *fwide*( ) function shall return a value greater than zero if, after the call, the stream has wide-orientation, a value less than zero if the stream has byte-orientation, or zero if the stream has no orientation.

ERRORS

The *fwide*( ) function may fail if:

CX [EBADF] The *stream* argument is not a valid stream.

EXAMPLES

None.

APPLICATION USAGE

A call to *fwide*( ) with *mode* set to zero can be used to determine the current orientation of a stream.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

Extensions beyond the ISO C standard are marked.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0225 [272] is applied.

NAME

fwprintf, swprintf, wprintf ‡'print formatted wide-character output

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

int fwprintf(FILE *restrict stream, const wchar_t *restrict format, ...);
int swprintf(wchar_t *restrict ws, size_t n,
    const wchar_t *restrict format, ...);
int wprintf(const wchar_t *restrict format, ...);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *fwprintf*( ) function shall place output on the named output *stream*. The *wprintf*( ) function shall place output on the standard output stream *stdout*. The *swprintf*( ) function shall place output followed by the null wide character in consecutive wide characters starting at **ws*; no more than *n* wide characters shall be written, including a terminating null wide character, which is always added (unless *n* is zero).

Each of these functions shall convert, format, and print its arguments under control of the *format* wide-character string. The *format* is composed of zero or more directives: *ordinary wide-characters*, which are simply copied to the output stream, and *conversion specifications*, each of which results in the fetching of zero or more arguments. The results are undefined if there are insufficient arguments for the *format*. If the *format* is exhausted while arguments remain, the excess arguments are evaluated but are otherwise ignored.

CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than to the next unused argument. In this case, the conversion specifier wide character `%` (see below) is replaced by the sequence "`%`*n*`$`", where *n* is a decimal integer in the range [1,{NL_ARGMAX}], giving the position of the argument in the argument list. This feature provides for the definition of *format* wide-character strings that select arguments in an order appropriate to specific languages (see the EXAMPLES section).

The *format* can contain either numbered argument specifications (that is, "`%`*n*`$`" and "`*`*m*`$`"), or unnumbered argument conversion specifications (that is, `%` and `*`), but not both. The only exception to this is that `%%` can be mixed with the "`%`*n*`$`" form. The results of mixing numbered and unnumbered argument specifications in a *format* wide-character string are undefined. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the (*N*–1)th, are specified in the *format* wide-character string.

In *format* wide-character strings containing the "`%`*n*`$`" form of conversion specification, numbered arguments in the argument list can be referenced from the *format* wide-character string as many times as required.

In *format* wide-character strings containing the `%` form of conversion specification, each argument in the argument list shall be used exactly once. It is unspecified whether an encoding error occurs if the format string contains **wchar_t** values that do not correspond to members of the character set of the current locale and the specified semantics do not require that value to be processed by *wcrtomb*( ).

CX All forms of the *fwprintf*( ) function allow for the insertion of a locale-dependent radix character in the output string, output as a wide-character value. The radix character is defined in the current locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix

character is not defined, the radix character shall default to a <period> (`'.'`).

CX Each conversion specification is introduced by the `'%'` wide character or by the wide-character sequence `"%`*n*`$"`, after which the following appear in sequence:

Zero or more *flags* (in any order), which modify the meaning of the conversion specification.

An optional minimum *field width*. If the converted value has fewer wide characters than the field width, it shall be padded with <space> characters by default on the left; it shall be padded on the right, if the left-adjustment flag (`'-'`), described below, is given to the field width. The field width takes the form of an <asterisk> (`'*'`), described below, or a decimal integer.

An optional *precision* that gives the minimum number of digits to appear for the `d`, `i`, `o`, `u`, `x`, and `X` conversion specifiers; the number of digits to appear after the radix character for the `a`, `A`, `e`, `E`, `f`, and `F` conversion specifiers; the maximum number of significant digits for the `g` and `G` conversion specifiers; or the maximum number of wide characters to be printed from a string in the `s` conversion specifiers. The precision takes the form of a <period> (`'.'`) followed either by an <asterisk> (`'*'`), described below, or an optional decimal digit string, where a null digit string is treated as 0. If a precision appears with any other conversion wide character, the behavior is undefined.

An optional length modifier that specifies the size of the argument.

A *conversion specifier* wide character that indicates the type of conversion to be applied.

A field width, or precision, or both, may be indicated by an <asterisk> (`'*'`). In this case an argument of type **int** supplies the field width or precision. Applications shall ensure that arguments specifying field width, or precision, or both appear in that order before the argument, if any, to be converted. A negative field width is taken as a `'-'` flag followed by a positive field
CX width. A negative precision is taken as if the precision were omitted. In *format* wide-character strings containing the `"%`*n*`$"` form of a conversion specification, a field width or precision may be indicated by the sequence `"*`*m*`$"`, where *m* is a decimal integer in the range [1,{NL_ARGMAX}] giving the position in the argument list (after the *format* argument) of an integer argument containing the field width or precision, for example:

```
wprintf(L"%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```

The flag wide characters and their meanings are:

CX `'` (The <apostrophe>.) The integer portion of the result of a decimal conversion (`%i`, `%d`, `%u`, `%f`, `%F`, `%g`, or `%G`) shall be formatted with thousands' grouping wide characters. For other conversions, the behavior is undefined. The numeric grouping wide character is used.

`-` The result of the conversion shall be left-justified within the field. The conversion shall be right-justified if this flag is not specified.

`+` The result of a signed conversion shall always begin with a sign (`'+'` or `'-'`). The conversion shall begin with a sign only when a negative value is converted if this flag is not specified.

<space> If the first wide character of a signed conversion is not a sign, or if a signed conversion results in no wide characters, a <space> shall be prefixed to the result. This means that if the <space> and `'+'` flags both appear, the <space> flag shall be ignored.

33801 # Specifies that the value is to be converted to an alternative form. For o conversion, it
33802 shall increase the precision, if and only if necessary, to force the first digit of the result
33803 to be zero (if the value and precision are both 0, a single 0 is printed). For x or X
33804 conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For a, A, e,
33805 E, f, F, g, and G conversion specifiers, the result shall always contain a radix character,
33806 even if no digits follow it. Without this flag, a radix character appears in the result of
33807 these conversions only if a digit follows it. For g and G conversion specifiers, trailing
33808 zeros shall *not* be removed from the result as they normally are. For other conversion
33809 specifiers, the behavior is undefined.

33810 0 For d, i, o, u, x, X, a, A, e, E, f, F, g, and G conversion specifiers, leading zeros
33811 (following any indication of sign or base) are used to pad to the field width rather than
33812 performing space padding, except when converting an infinity or NaN. If the '0' and
33813 '−' flags both appear, the '0' flag shall be ignored. For d, i, o, u, x, and X conversion
33814 CX specifiers, if a precision is specified, the '0' flag shall be ignored. If the '0' and
33815 <apostrophe> flags both appear, the grouping wide characters are inserted before zero
33816 padding. For other conversions, the behavior is undefined.

33817 The length modifiers and their meanings are:

33818 hh Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **signed char**
33819 or **unsigned char** argument (the argument will have been promoted according to the
33820 integer promotions, but its value shall be converted to **signed char** or **unsigned char**
33821 before printing); or that a following n conversion specifier applies to a pointer to a
33822 **signed char** argument.

33823 h Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **short** or
33824 **unsigned short** argument (the argument will have been promoted according to the
33825 integer promotions, but its value shall be converted to **short** or **unsigned short** before
33826 printing); or that a following n conversion specifier applies to a pointer to a **short**
33827 argument.

33828 l (ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long** or
33829 **unsigned long** argument; that a following n conversion specifier applies to a pointer to
33830 a **long** argument; that a following c conversion specifier applies to a **wint_t** argument;
33831 that a following s conversion specifier applies to a pointer to a **wchar_t** argument; or
33832 has no effect on a following a, A, e, E, f, F, g, or G conversion specifier.

33833 ll (ell-ell)
33834 Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long long**
33835 or **unsigned long long** argument; or that a following n conversion specifier applies to a
33836 pointer to a **long long** argument.

33837 j Specifies that a following d, i, o, u, x, or X conversion specifier applies to an **intmax_t**
33838 or **uintmax_t** argument; or that a following n conversion specifier applies to a pointer
33839 to an **intmax_t** argument.

33840 z Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **size_t** or the
33841 corresponding signed integer type argument; or that a following n conversion specifier
33842 applies to a pointer to a signed integer type corresponding to a **size_t** argument.

33843 t Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **ptrdiff_t** or
33844 the corresponding **unsigned** type argument; or that a following n conversion specifier
33845 applies to a pointer to a **ptrdiff_t** argument.

33846 L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to a **long**
33847 **double** argument.

33848 If a length modifier appears with any conversion specifier other than as specified above, the
33849 behavior is undefined.

33850 The conversion specifiers and their meanings are:

33851 d,i The **int** argument shall be converted to a signed decimal in the style "[−]*dddd*". The
33852 precision specifies the minimum number of digits to appear; if the value being
33853 converted can be represented in fewer digits, it shall be expanded with leading zeros.
33854 The default precision shall be 1. The result of converting zero with an explicit precision
33855 of zero shall be no wide characters.

33856 o The **unsigned** argument shall be converted to unsigned octal format in the style
33857 "dddd". The precision specifies the minimum number of digits to appear; if the value
33858 being converted can be represented in fewer digits, it shall be expanded with leading
33859 zeros. The default precision shall be 1. The result of converting zero with an explicit
33860 precision of zero shall be no wide characters.

33861 u The **unsigned** argument shall be converted to unsigned decimal format in the style
33862 "dddd". The precision specifies the minimum number of digits to appear; if the value
33863 being converted can be represented in fewer digits, it shall be expanded with leading
33864 zeros. The default precision shall be 1. The result of converting zero with an explicit
33865 precision of zero shall be no wide characters.

33866 x The **unsigned** argument shall be converted to unsigned hexadecimal format in the style
33867 "dddd"; the letters "abcdef" are used. The precision specifies the minimum number
33868 of digits to appear; if the value being converted can be represented in fewer digits, it
33869 shall be expanded with leading zeros. The default precision shall be 1. The result of
33870 converting zero with an explicit precision of zero shall be no wide characters.

33871 X Equivalent to the x conversion specifier, except that letters "ABCDEF" are used instead
33872 of "abcdef".

33873 f,F The **double** argument shall be converted to decimal notation in the style
33874 "[−]*ddd.ddd*", where the number of digits after the radix character shall be equal to
33875 the precision specification. If the precision is missing, it shall be taken as 6; if the
33876 precision is explicitly zero and no '#' flag is present, no radix character shall appear. If
33877 a radix character appears, at least one digit shall appear before it. The value shall be
33878 rounded in an implementation-defined manner to the appropriate number of digits.

33879 A **double** argument representing an infinity shall be converted in one of the styles
33880 "[−]inf" or "[−]infinity"; which style is implementation-defined. A **double**
33881 argument representing a NaN shall be converted in one of the styles "[−]nan" or
33882 "[−]nan(*n-char-sequence*)"; which style, and the meaning of any *n-char-sequence*,
33883 is implementation-defined. The F conversion specifier produces "INF", "INFINITY",
33884 or "NAN" instead of "inf", "infinity", or "nan", respectively.

33885 e,E The **double** argument shall be converted in the style "[−]*d.ddd*e±dd", where there
33886 shall be one digit before the radix character (which is non-zero if the argument is non-
33887 zero) and the number of digits after it shall be equal to the precision; if the precision is
33888 missing, it shall be taken as 6; if the precision is zero and no '#' flag is present, no
33889 radix character shall appear. The value shall be rounded in an implementation-defined
33890 manner to the appropriate number of digits. The E conversion wide character shall
33891 produce a number with 'E' instead of 'e' introducing the exponent. The exponent
33892 shall always contain at least two digits. If the value is zero, the exponent shall be zero.

A **double** argument representing an infinity or NaN shall be converted in the style of an `f` or `F` conversion specifier.

`g,G` The **double** argument representing a floating-point number shall be converted in the style `f` or `e` (or in the style `F` or `E` in the case of a `G` conversion specifier), depending on the value converted and the precision. Let `P` equal the precision if non-zero, 6 if the precision is omitted, or 1 if the precision is zero. Then, if a conversion with style `E` would have an exponent of *X*:

- If *P*>*X*≥−4, the conversion shall be with style `f` (or `F`) and precision `P`−(*X*+1).
- Otherwise, the conversion shall be with style `e` (or `E`) and precision `P`−1.

Finally, unless the `'#'` flag is used, any trailing zeros shall be removed from the fractional portion of the result and the decimal-point character shall be removed if there is no fractional portion remaining.

A **double** argument representing an infinity or NaN shall be converted in the style of an `f` or `F` conversion specifier.

`a,A` A **double** argument representing a floating-point number shall be converted in the style `"[-]0x`*h*`.`*hhhh*`p±`*d*`"`, where there shall be one hexadecimal digit (which is non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point wide character and the number of hexadecimal digits after it shall be equal to the precision; if the precision is missing and FLT_RADIX is a power of 2, then the precision shall be sufficient for an exact representation of the value; if the precision is missing and FLT_RADIX is not a power of 2, then the precision shall be sufficient to distinguish values of type **double**, except that trailing zeros may be omitted; if the precision is zero and the `'#'` flag is not specified, no decimal-point wide character shall appear. The letters `"abcdef"` are used for `a` conversion and the letters `"ABCDEF"` for `A` conversion. The `A` conversion specifier produces a number with `'X'` and `'P'` instead of `'x'` and `'p'`. The exponent shall always contain at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent shall be zero.

A **double** argument representing an infinity or NaN shall be converted in the style of an `f` or `F` conversion specifier.

`c` If no `l` (ell) qualifier is present, the **int** argument shall be converted to a wide character as if by calling the *btowc*() function and the resulting wide character shall be written. Otherwise, the **wint_t** argument shall be converted to **wchar_t**, and written.

`s` If no `l` (ell) qualifier is present, the application shall ensure that the argument is a pointer to a character array containing a character sequence beginning in the initial shift state. Characters from the array shall be converted as if by repeated calls to the *mbrtowc*() function, with the conversion state described by an **mbstate_t** object initialized to zero before the first character is converted, and written up to (but not including) the terminating null wide character. If the precision is specified, no more than that many wide characters shall be written. If the precision is not specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character.

If an `l` (ell) qualifier is present, the application shall ensure that the argument is a pointer to an array of type **wchar_t**. Wide characters from the array shall be written up to (but not including) a terminating null wide character. If no precision is specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many wide characters

shall be written.

`p` The application shall ensure that the argument is a pointer to **void**. The value of the pointer shall be converted to a sequence of printable wide characters in an implementation-defined manner.

`n` The application shall ensure that the argument is a pointer to an integer into which is written the number of wide characters written to the output so far by this call to one of the *fwprintf*( ) functions. No argument shall be converted, but one shall be consumed. If the conversion specification includes any flags, a field width, or a precision, the behavior is undefined.

XSI `C` Equivalent to `lc`.

XSI `S` Equivalent to `ls`.

`%` Output a `'%'` wide character; no argument shall be converted. The entire conversion specification shall be `%%`.

If a conversion specification does not match one of the above forms, the behavior is undefined.

In no case does a nonexistent or small field width cause truncation of a field; if the result of a conversion is wider than the field width, the field shall be expanded to contain the conversion result. Characters generated by *fwprintf*( ) and *wprintf*( ) shall be printed as if *fputwc*( ) had been called.

For `a` and `A` conversions, if FLT_RADIX is not a power of 2 and the result is not exactly representable in the given precision, the result should be one of the two adjacent numbers in hexadecimal floating style with the given precision, with the extra stipulation that the error should have a correct sign for the current rounding direction.

For `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, if the number of significant decimal digits is at most DECIMAL_DIG, then the result should be correctly rounded. If the number of significant decimal digits is more than DECIMAL_DIG but the source value is exactly representable with DECIMAL_DIG digits, then the result should be an exact representation with trailing zeros. Otherwise, the source value is bounded by two adjacent decimal strings $L < U$, both having DECIMAL_DIG significant digits; the value of the resultant decimal string D should satisfy $L <= D <= U$, with the extra stipulation that the error should have a correct sign for the current rounding direction.

CX The last data modification and last file status change timestamps of the file shall be marked for update between the call to a successful execution of *fwprintf*( ) or *wprintf*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream, or a call to *exit*( ) or *abort*( ).

RETURN VALUE

Upon successful completion, these functions shall return the number of wide characters transmitted, excluding the terminating null wide character in the case of *swprintf*( ), or a negative CX value if an output error was encountered, and set *errno* to indicate the error.

If n or more wide characters were requested to be written, *swprintf*( ) shall return a negative CX value, and set *errno* to indicate the error.

ERRORS

For the conditions under which *fwprintf*( ) and *wprintf*( ) fail and may fail, refer to *fputwc*( ).

In addition, all forms of *fwprintf*( ) shall fail if:

CX [EILSEQ] A wide-character code that does not correspond to a valid character has been detected.

In addition, *fwprintf*( ) and *wprintf*( ) may fail if:

CX [ENOMEM] Insufficient storage space is available.

The *swprintf*( ) shall fail if:

CX [EOVERFLOW] The value of *n* is greater than {INT_MAX} or the number of bytes needed to hold the output excluding the terminating null is greater than {INT_MAX}.

EXAMPLES

To print the language-independent date and time format, the following statement could be used:

```
wprintf(format, weekday, month, day, hour, min);
```

For American usage, *format* could be a pointer to the wide-character string:

```
L"%s, %s %d, %d:%.2d\n"
```

producing the message:

```
Sunday, July 3, 10:02
```

whereas for German usage, *format* could be a pointer to the wide-character string:

```
L"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"
```

producing the message:

```
Sonntag, 3. Juli, 10:02
```

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that there are insufficient arguments for the format, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

The Open Group Corrigendum U040/1 is applied to the RETURN VALUE section, describing the case if *n* or more wide characters are requested to be written using *swprintf*( ).

The normative text is updated to avoid use of the term ``must'' for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

The prototypes for *fwprintf*( ), *swprintf*( ), and *wprintf*( ) are updated.

The DESCRIPTION is updated.

The `hh`, `ll`, `j`, `t`, and `z` length modifiers are added.

The `a`, `A`, and `F` conversion characters are added.

XSI shading is removed from the description of character string representations of infinity and NaN floating-point values.

The DESCRIPTION is updated to use the terms ``conversion specifier'' and ``conversion specification'' consistently.

ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

Issue 7

Austin Group Interpretation 1003.1-2001 #161 is applied, updating the DESCRIPTION of the 0 flag.

Austin Group Interpretation 1003.1-2001 #170 is applied.

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #68 (SD5-XSH-ERN-70) is applied, revising the description of `g` and `G`.

Functionality relating to the "`%n$`" form of conversion specification and the <apostrophe> flag is moved from the XSI option to the Base.

The [EOVERFLOW] error is added for *swprintf*( ).

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0226 [302] and XSH/TC1-2008/0227 [14] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0144 [73], XSH/TC2-2008/0145 [894], XSH/TC2-2008/0146 [557], and XSH/TC2-2008/0147 [936] are applied.

34042 **NAME**

34043 fwrite ‡'binary output

34044 **SYNOPSIS**

34045 `#include <stdio.h>`

34046 `size_t fwrite(const void *restrict ptr, size_t size, size_t nitems,`
34047 `FILE *restrict stream);`

34048 **DESCRIPTION**

34049 CX The functionality described on this reference page is aligned with the ISO C standard. Any
34050 conflict between the requirements described here and the ISO C standard is unintentional. This
34051 volume of POSIX.1-2017 defers to the ISO C standard.

34052 The *fwrite*( ) function shall write, from the array pointed to by *ptr*, up to *nitems* elements whose
34053 size is specified by *size*, to the stream pointed to by *stream*. For each object, *size* calls shall be
34054 made to the *fputc*( ) function, taking the values (in order) from an array of **unsigned char** exactly
34055 overlaying the object. The file-position indicator for the stream (if defined) shall be advanced by
34056 the number of bytes successfully written. If an error occurs, the resulting value of the file-
34057 position indicator for the stream is unspecified.

34058 CX The last data modification and last file status change timestamps of the file shall be marked for
34059 update between the successful execution of *fwrite*( ) and the next successful completion of a call
34060 to *fflush*( ) or *fclose*( ) on the same stream, or a call to *exit*( ) or *abort*( ).

34061 **RETURN VALUE**

34062 The *fwrite*( ) function shall return the number of elements successfully written, which may be
34063 less than *nitems* if a write error is encountered. If *size* or *nitems* is 0, *fwrite*( ) shall return 0 and the
34064 state of the stream remains unchanged. Otherwise, if a write error occurs, the error indicator for
34065 CX the stream shall be set, and *errno* shall be set to indicate the error.

34066 **ERRORS**

34067 Refer to *fputc*( ).

34068 **EXAMPLES**

34069 None.

34070 **APPLICATION USAGE**

34071 Because of possible differences in element length and byte ordering, files written using *fwrite*( )
34072 are application-dependent, and possibly cannot be read using *fread*( ) by a different application
34073 or by the same application on a different processor.

34074 **RATIONALE**

34075 None.

34076 **FUTURE DIRECTIONS**

34077 None.

34078 **SEE ALSO**

34079 Section 2.5 (on page 495), *ferror*( ), *fopen*( ), *fprintf*( ), *putc*( ), *puts*( ), *write*( )

34080 XBD **<stdio.h>**

34081 **CHANGE HISTORY**

34082 First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

The *fwrite*( ) prototype is updated.

The DESCRIPTION is updated to clarify how the data is written out using *fputc*( ).

Issue 7

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0228 [14] is applied.

NAME

fwscanf, swscanf, wscanf ‡'convert formatted wide-character input

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

int fwscanf(FILE *restrict stream, const wchar_t *restrict format, ...);
int swscanf(const wchar_t *restrict ws,
    const wchar_t *restrict format, ...);
int wscanf(const wchar_t *restrict format, ...);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *fwscanf*( ) function shall read from the named input *stream*. The *wscanf*( ) function shall read from the standard input stream *stdin*. The *swscanf*( ) function shall read from the wide-character string *ws*. Each function reads wide characters, interprets them according to a format, and stores the results in its arguments. Each expects, as arguments, a control wide-character string *format* described below, and a set of *pointer* arguments indicating where the converted input should be stored. The result is undefined if there are insufficient arguments for the format. If the *format* is exhausted while arguments remain, the excess arguments are evaluated but are otherwise ignored.

CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than to the next unused argument. In this case, the conversion specifier wide character `%` (see below) is replaced by the sequence "`%`*n*`$`", where *n* is a decimal integer in the range [1,{NL_ARGMAX}]. This feature provides for the definition of *format* wide-character strings that select arguments in an order appropriate to specific languages. In *format* wide-character strings containing the "`%`*n*`$`" form of conversion specifications, it is unspecified whether numbered arguments in the argument list can be referenced from the *format* wide-character string more than once.

The *format* can contain either form of a conversion specification ‡that is,`%` or "`%`*n*`$`" ‡úbthe two forms cannot normally be mixed within a single *format* wide-character string. The only exception to this is that `%%` or `%*` can be mixed with the "`%`*n*`$`" form. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the (*N*−1)th, are pointers.

The *fwscanf*( ) function in all its forms allows for detection of a language-dependent radix character in the input string, encoded as a wide-character value. The radix character is defined in the current locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a <period> ('`.`').

The *format* is a wide-character string composed of zero or more directives. Each directive is composed of one of the following: one or more white-space wide characters (<space>, <tab>, <newline>, <vertical-tab>, or <form-feed>); an ordinary wide character (neither '`%`' nor a white-space character); or a conversion specification. It is unspecified whether an encoding error occurs if the format string contains **wchar_t** values that do not correspond to members of the character set of the current locale and the specified semantics do not require that value to be processed by *wcrtomb*( ).

CX Each conversion specification is introduced by the '`%`' or by the character sequence "`%`*n*`$`", after which the following appear in sequence:

An optional assignment-suppressing character '*'.

An optional non-zero decimal integer that specifies the maximum field width.

CX An optional assignment-allocation character 'm'.

An optional length modifier that specifies the size of the receiving object.

A conversion specifier wide character that specifies the type of conversion to be applied. The valid conversion specifiers are described below.

The *fwscanf*( ) functions shall execute each directive of the format in turn. If a directive fails, as detailed below, the function shall return. Failures are described as input failures (due to the unavailability of input bytes) or matching failures (due to inappropriate input).

A directive composed of one or more white-space wide characters is executed by reading input until no more valid input can be read, or up to the first wide character which is not a white-space wide character, which remains unread.

A directive that is an ordinary wide character shall be executed as follows. The next wide character is read from the input and compared with the wide character that comprises the directive; if the comparison shows that they are not equivalent, the directive shall fail, and the differing and subsequent wide characters remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a wide character from being read, the directive shall fail.

A directive that is a conversion specification defines a set of matching input sequences, as described below for each conversion wide character. A conversion specification is executed in the following steps.

Input white-space wide characters (as specified by *iswspace*( )) shall be skipped, unless the conversion specification includes a [, c, or n conversion specifier.

An item shall be read from the input, unless the conversion specification includes an n conversion specifier wide character. An input item is defined as the longest sequence of input wide characters, not exceeding any specified field width, which is an initial subsequence of a matching sequence. The first wide character, if any, after the input item shall remain unread. If the length of the input item is zero, the execution of the conversion specification shall fail; this condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is an input failure.

Except in the case of a % conversion specifier, the input item (or, in the case of a %n conversion specification, the count of input wide characters) shall be converted to a type appropriate to the conversion wide character. If the input item is not a matching sequence, the execution of the conversion specification shall fail; this condition is a matching failure. Unless assignment suppression was indicated by a '*', the result of the conversion shall be placed in the object pointed to by the first argument following the *format* argument that has not already received a conversion result if the conversion specification is introduced by %, CX or in the *n*th argument if introduced by the wide-character sequence "%*n*$". If this object does not have an appropriate type, or if the result of the conversion cannot be represented in the space provided, the behavior is undefined.

CX The %c, %s, and %[conversion specifiers shall accept an optional assignment-allocation character 'm', which shall cause a memory buffer to be allocated to hold the wide-character string converted including a terminating null wide character. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. The system shall allocate a buffer as if *malloc*( ) had been called. The application shall be responsible for freeing the memory after usage. If there is insufficient memory to allocate a buffer, the function shall set *errno* to [ENOMEM] and a

conversion error shall result. If the function returns EOF, any memory successfully allocated for parameters using assignment-allocation character 'm' by this call shall be freed before the function returns.

The length modifiers and their meanings are:

hh Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **signed char** or **unsigned char**.

h Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **short** or **unsigned short**.

l (ell) Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **long** or **unsigned long**; that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to **double**; or that a following c, s, or [conversion specifier applies to an argument with type pointer to **wchar_t**. If the 'm' assignment-allocation character is specified, the conversion applies to an argument with the type pointer to a pointer to **wchar_t**.

CX

ll (ell-ell) Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **long long** or **unsigned long long**.

j Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **intmax_t** or **uintmax_t**.

z Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **size_t** or the corresponding signed integer type.

t Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **ptrdiff_t** or the corresponding **unsigned** type.

L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to **long double**.

If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.

The following conversion specifier wide characters are valid:

d Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *wcstol*() with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

i Matches an optionally signed integer, whose format is the same as expected for the subject sequence of *wcstol*() with 0 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

o Matches an optionally signed octal integer, whose format is the same as expected for the subject sequence of *wcstoul*() with the value 8 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

u Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *wcstoul*() with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

`x` Matches an optionally signed hexadecimal integer, whose format is the same as expected for the subject sequence of *wcstoul*( ) with the value 16 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

`a`, `e`, `f`, `g`
Matches an optionally signed floating-point number, infinity, or NaN whose format is the same as expected for the subject sequence of *wcstod*( ). In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **float**.

If the *fwprintf*( ) family of functions generates character string representations for infinity and NaN (a symbolic entity encoded in floating-point format) to support IEEE Std 754-1985, the *fwscanf*( ) family of functions shall recognize them as input.

`s` Matches a sequence of non-white-space wide characters. If no `l` (ell) qualifier is present, characters from the input field shall be converted as if by repeated calls to the *wcrtomb*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first wide character is converted. If the `'m'` assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to a character array large enough to accept the sequence and the
CX terminating null character, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a **wchar_t**.

If the `l` (ell) qualifier is present and the `'m'` assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the sequence and the terminating null wide
CX character, which shall be added automatically. If the `l` (ell) qualifier is present and the `'m'` assignment-allocation character is present, the application shall ensure that the corresponding argument is a pointer to a pointer to a **wchar_t**.

`[` Matches a non-empty sequence of wide characters from a set of expected wide characters (the *scanset*). If no `l` (ell) qualifier is present, wide characters from the input field shall be converted as if by repeated calls to the *wcrtomb*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first wide character is converted. If the `'m'` assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to a character array large enough to accept the sequence and the terminating null character, which
CX shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a **wchar_t**.

If an `l` (ell) qualifier is present and the `'m'` assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the sequence and the terminating null wide
CX character. If an `l` (ell) qualifier is present and the `'m'` assignment-allocation character is specified, the application shall ensure that the corresponding argument is a pointer to a pointer to a **wchar_t**.

The conversion specification includes all subsequent wide characters in the *format* string up to and including the matching <right-square-bracket> (`']'`). The wide characters between the square brackets (the *scanlist*) comprise the scanset, unless the wide character after the <left-square-bracket> is a <circumflex> (`'^'`), in which case the scanset contains all wide characters that do not appear in the scanlist between the <circumflex> and the <right-square-bracket>. If the conversion specification begins

with `"[ ]"` or `"[^]"`, the <right-square-bracket> is included in the scanlist and the next <right-square-bracket> is the matching <right-square-bracket> that ends the conversion specification; otherwise, the first <right-square-bracket> is the one that ends the conversion specification. If a `'-'` is in the scanlist and is not the first wide character, nor the second where the first wide character is a `'^'`, nor the last wide character, the behavior is implementation-defined.

`c` Matches a sequence of wide characters of exactly the number specified by the field width (1 if no field width is present in the conversion specification).

If no `l` (ell) length modifier is present, characters from the input field shall be converted as if by repeated calls to the *wcrtomb*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first wide character is converted. No null character is added. If the `'m'` assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to the initial
CX element of a character array large enough to accept the sequence. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a **char**.

No null wide character is added. If an `l` (ell) length modifier is present and the `'m'` assignment-allocation character is not specified, the application shall ensure that the corresponding argument shall be a pointer to the initial element of an array of **wchar_t**
CX large enough to accept the sequence. If an `l` (ell) qualifier is present and the `'m'` assignment-allocation character is specified, the application shall ensure that the corresponding argument is a pointer to a pointer to a **wchar_t**.

`p` Matches an implementation-defined set of sequences, which shall be the same as the set of sequences that is produced by the `%p` conversion specification of the corresponding *fwprintf*( ) functions. The application shall ensure that the corresponding argument is a pointer to a pointer to **void**. The interpretation of the input item is implementation-defined. If the input item is a value converted earlier during the same program execution, the pointer that results shall compare equal to that value; otherwise, the behavior of the `%p` conversion is undefined.

`n` No input is consumed. The application shall ensure that the corresponding argument is a pointer to the integer into which is to be written the number of wide characters read from the input so far by this call to the *fwscanf*( ) functions. Execution of a `%n` conversion specification shall not increment the assignment count returned at the completion of execution of the function. No argument shall be converted, but one shall be consumed. If the conversion specification includes an assignment-suppressing wide character or a field width, the behavior is undefined.

XSI `C` Equivalent to `lc`.

XSI `S` Equivalent to `ls`.

`%` Matches a single `'%'` wide character; no conversion or assignment shall occur. The complete conversion specification shall be `%%`.

If a conversion specification is invalid, the behavior is undefined.

The conversion specifiers `A`, `E`, `F`, `G`, and `X` are also valid and shall be equivalent to, respectively, `a`, `e`, `f`, `g`, and `x`.

If end-of-file is encountered during input, conversion is terminated. If end-of-file occurs before any wide characters matching the current conversion specification (except for `%n`) have been read (other than leading white-space, where permitted), execution of the current conversion

specification shall terminate with an input failure. Otherwise, unless execution of the current conversion specification is terminated with a matching failure, execution of the following conversion specification (if any) shall be terminated with an input failure.

Reaching the end of the string in *swscanf*( ) shall be equivalent to encountering end-of-file for *fwscanf*( ).

If conversion terminates on a conflicting input, the offending input shall be left unread in the input. Any trailing white space (including <newline>) shall be left unread unless matched by a conversion specification. The success of literal matches and suppressed assignments is only directly determinable via the `%n` conversion specification.

CX The *fwscanf*( ) and *wscanf*( ) functions may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetwc*( ), *fgetws*( ), *fwscanf*( ), *getwc*( ), *getwchar*( ), *vfwscanf*( ), *vwscanf*( ), or *wscanf*( ) using *stream* that returns data not supplied by a prior call to *ungetwc*( ).

RETURN VALUE

Upon successful completion, these functions shall return the number of successfully matched and assigned input items; this number can be zero in the event of an early matching failure. If the input ends before the first conversion (if any) has completed, and without a matching failure having occurred, EOF shall be returned. If an error occurs before the first conversion (if any) has
CX completed, and without a matching failure having occurred, EOF shall be returned and *errno* shall be set to indicate the error. If a read error occurs, the error indicator for the stream shall be set.

ERRORS

For the conditions under which the *fwscanf*( ) functions shall fail and may fail, refer to *fgetwc*( ).

In addition, the *fwscanf*( ) function shall fail if:

CX [EILSEQ] Input byte sequence does not form a valid character.

[ENOMEM] Insufficient storage space is available.

In addition, the *fwscanf*( ) function may fail if:

CX [EINVAL] There are insufficient arguments.

EXAMPLES

The call:

```
int i, n; float x; char name[50];
n = wscanf(L"%d%f%s", &i, &x, name);
```

with the input line:

```
25 54.32E-1 Hamster
```

assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string `"Hamster"`.

The call:

```
int i; float x; char name[50];
(void) wscanf(L"%2d%f%*d %[0123456789]", &i, &x, name);
```

with input:

```
56789 0123 56a72
```

assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string `"56\0"` in *name*. The next call to

getchar( ) shall return the character `'a'`.

APPLICATION USAGE

In format strings containing the `'%'` form of conversion specifications, each argument in the argument list is used exactly once.

For functions that allocate memory as if by *malloc*( ), the application should release such memory when it is no longer required by a call to *free*( ). For *fwscanf*( ), this is memory allocated via use of the `'m'` assignment-allocation character.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Chapter 7 (on page 135), **<inttypes.h>**, **<stdio.h>**, **<wchar.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fwscanf*( ) and *swscanf*( ) are updated.
- The DESCRIPTION is updated.
- The `hh`, `ll`, `j`, `t`, and `z` length modifiers are added.
- The `a`, `A`, and `F` conversion characters are added.

The DESCRIPTION is updated to use the terms ``conversion specifier'' and ``conversion specification'' consistently.

Issue 7

Austin Group Interpretation 1003.1-2001 #170 is applied.

SD5-XSH-ERN-132 is applied, adding the assignment-allocation character `'m'`.

Functionality relating to the `"%n$"` form of conversion specification is moved from the XSI option to the Base.

Changes are made related to support for finegrained timestamps.

The APPLICATION USAGE section is updated to clarify that memory is allocated as if by *malloc*( ).

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0229 [302] and XSH/TC1-2008/0230 [14] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0148 [73], XSH/TC2-2008/0149 [823], and XSH/TC2-2008/0150 [936] are applied.

34402 **NAME**

34403 gai_strerror — address and name information error description

34404 **SYNOPSIS**

34405 `#include <netdb.h>`

34406 `const char *gai_strerror(int ecode);`

34407 **DESCRIPTION**

34408 The *gai_strerror*( ) function shall return a text string describing an error value for the *getaddrinfo*( )
34409 and *getnameinfo*( ) functions listed in the **<netdb.h>** header.

34410 When the *ecode* argument is one of the following values listed in the **<netdb.h>** header:

34411 [EAI_AGAIN] [EAI_NONAME]
34412 [EAI_BADFLAGS] [EAI_OVERFLOW]
34413 [EAI_FAIL] [EAI_SERVICE]
34414 [EAI_FAMILY] [EAI_SOCKTYPE]
34415 [EAI_MEMORY] [EAI_SYSTEM]

34416 the function return value shall point to a string describing the error. If the argument is not one
34417 of those values, the function shall return a pointer to a string whose contents indicate an
34418 unknown error.

34419 **RETURN VALUE**

34420 Upon successful completion, *gai_strerror*( ) shall return a pointer to an implementation-defined
34421 string.

34422 **ERRORS**

34423 No errors are defined.

34424 **EXAMPLES**

34425 None.

34426 **APPLICATION USAGE**

34427 None.

34428 **RATIONALE**

34429 None.

34430 **FUTURE DIRECTIONS**

34431 None.

34432 **SEE ALSO**

34433 *freeaddrinfo*( )

34434 XBD **<netdb.h>**

34435 **CHANGE HISTORY**

34436 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

34437 The Open Group Base Resolution bwg2001-009 is applied, which changes the return type from
34438 **char *** to **const char ***. This is for coordination with the IPnG Working Group.

34439 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/22 is applied, adding the
34440 [EAI_OVERFLOW] error code.

34441 **NAME**

34442 getaddrinfo — get address information

34443 **SYNOPSIS**

34444 ```
#include <sys/socket.h>
```

34445 ```
#include <netdb.h>
```

34446 ```
int getaddrinfo(const char *restrict nodename,
```

34447 ```
    const char *restrict servname,
```

34448 ```
    const struct addrinfo *restrict hints,
```

34449 ```
    struct addrinfo **restrict res);
```

34450 **DESCRIPTION**

34451 Refer to *freeaddrinfo( )*.

34452 **NAME**

34453 getc — get a byte from a stream

34454 **SYNOPSIS**

34455 `#include <stdio.h>`

34456 `int getc(FILE *stream);`

34457 **DESCRIPTION**

34458 CX The functionality described on this reference page is aligned with the ISO C standard. Any
34459 conflict between the requirements described here and the ISO C standard is unintentional. This
34460 volume of POSIX.1-2017 defers to the ISO C standard.

34461 The *getc*( ) function shall be equivalent to *fgetc*( ), except that if it is implemented as a macro it
34462 may evaluate *stream* more than once, so the argument should never be an expression with side-
34463 effects.

34464 **RETURN VALUE**

34465 Refer to *fgetc*( ).

34466 **ERRORS**

34467 Refer to *fgetc*( ).

34468 **EXAMPLES**

34469 None.

34470 **APPLICATION USAGE**

34471 If the integer value returned by *getc*( ) is stored into a variable of type **char** and then compared
34472 against the integer constant EOF, the comparison may never succeed, because sign-extension of
34473 a variable of type **char** on widening to integer is implementation-defined.

34474 Since it may be implemented as a macro, *getc*( ) may treat incorrectly a *stream* argument with
34475 side-effects. In particular, *getc*(*f*++) does not necessarily work as expected. Therefore, use of this
34476 function should be preceded by `"#undef getc"` in such situations; *fgetc*( ) could also be used.

34477 **RATIONALE**

34478 None.

34479 **FUTURE DIRECTIONS**

34480 None.

34481 **SEE ALSO**

34482 Section 2.5 (on page 495), *fgetc*( )

34483 XBD **<stdio.h>**

34484 **CHANGE HISTORY**

34485 First released in Issue 1. Derived from Issue 1 of the SVID.

34486 **Issue 7**

34487 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0231 [14] is applied.

NAME

getc_unlocked, getchar_unlocked, putc_unlocked, putchar_unlocked ‡'stdio with explicit client locking

SYNOPSIS

CX
```
#include <stdio.h>

int getc_unlocked(FILE *stream);
int getchar_unlocked(void);
int putc_unlocked(int c, FILE *stream);
int putchar_unlocked(int c);
```

DESCRIPTION

Versions of the functions *getc*(), *getchar*(), *putc*(), and *putchar*() respectively named *getc_unlocked*(), *getchar_unlocked*(), *putc_unlocked*(), and *putchar_unlocked*() shall be provided which are functionally equivalent to the original versions, with the exception that they are not required to be implemented in a fully thread-safe manner. They shall be thread-safe when used within a scope protected by *flockfile*() (or *ftrylockfile*()) and *funlockfile*(). These functions can safely be used in a multi-threaded program if and only if they are called while the invoking thread owns the (**FILE** *) object, as is the case after a successful call to the *flockfile*() or *ftrylockfile*() functions.

If *getc_unlocked*() or *putc_unlocked*() are implemented as macros they may evaluate *stream* more than once, so the *stream* argument should never be an expression with side-effects.

RETURN VALUE

See *getc*(), *getchar*(), *putc*(), and *putchar*().

ERRORS

See *getc*(), *getchar*(), *putc*(), and *putchar*().

EXAMPLES

None.

APPLICATION USAGE

Since they may be implemented as macros, *getc_unlocked*() and *putc_unlocked*() may treat incorrectly a *stream* argument with side-effects. In particular, *getc_unlocked*(*f++) and *putc_unlocked*(c,*f++) do not necessarily work as expected. Therefore, use of these functions in such situations should be preceded by the following statement as appropriate:

```
#undef getc_unlocked
#undef putc_unlocked
```

RATIONALE

Some I/O functions are typically implemented as macros for performance reasons (for example, *putc*() and *getc*()). For safety, they need to be synchronized, but it is often too expensive to synchronize on every character. Nevertheless, it was felt that the safety concerns were more important; consequently, the *getc*(), *getchar*(), *putc*(), and *putchar*() functions are required to be thread-safe. However, unlocked versions are also provided with names that clearly indicate the unsafe nature of their operation but can be used to exploit their higher performance. These unlocked versions can be safely used only within explicitly locked program regions, using exported locking primitives. In particular, a sequence such as:

```
flockfile(fileptr);
putc_unlocked('1', fileptr);
putc_unlocked('\n', fileptr);
fprintf(fileptr, "Line 2\n");
```

```
funlockfile(fileptr);
```

is permissible, and results in the text sequence:

```
1
Line 2
```

being printed without being interspersed with output from other threads.

It would be wrong to have the standard names such as *getc*( ), *putc*( ), and so on, map to the ``faster, but unsafe'' rather than the ``slower, but safe'' versions. In either case, you would still want to inspect all uses of *getc*( ), *putc*( ), and so on, by hand when converting existing code. Choosing the safe bindings as the default, at least, results in correct code and maintains the ``atomicity at the function'' invariant. To do otherwise would introduce gratuitous synchronization errors into converted code. Other routines that modify the *stdio* (**FILE** *) structures or buffers are also safely synchronized.

Note that there is no need for functions of the form *getc_locked*( ), *putc_locked*( ), and so on, since this is the functionality of *getc*( ), *putc*( ), *et al*. It would be inappropriate to use a feature test macro to switch a macro definition of *getc*( ) between *getc_locked*( ) and *getc_unlocked*( ), since the ISO C standard requires an actual function to exist, a function whose behavior could not be changed by the feature test macro. Also, providing both the *xxx_locked*( ) and *xxx_unlocked*( ) forms leads to the confusion of whether the suffix describes the behavior of the function or the circumstances under which it should be used.

Three additional routines, *flockfile*( ), *ftrylockfile*( ), and *funlockfile*( ) (which may be macros), are provided to allow the user to delineate a sequence of I/O statements that are executed synchronously.

The *ungetc*( ) function is infrequently called relative to the other functions/macros so no unlocked variation is needed.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

These functions are marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U030/2 is applied, adding APPLICATION USAGE describing how applications should be written to avoid the case when the functions are implemented as macros.

Issue 7

The *getc_unlocked*( ), *getchar_unlocked*( ), *putc_unlocked*( ), and *putchar_unlocked*( ) functions are moved from the Thread-Safe Functions option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0232 [395], XSH/TC1-2008/0233 [395], XSH/TC1-2008/0234 [395], and XSH/TC1-2008/0235 [14] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0151 [826] is applied.

34576 **NAME**

34577 getchar — get a byte from a *stdin* stream

34578 **SYNOPSIS**

34579 `#include <stdio.h>`

34580 `int getchar(void);`

NAME

getchar_unlocked ‡'stdio with explicit client locking

SYNOPSIS

CX
```
#include <stdio.h>

int getchar_unlocked(void);
```

DESCRIPTION

Refer to *getc_unlocked( )*.

34614 **NAME**

34615 getcwd — get the pathname of the current working directory

34616 **SYNOPSIS**

34617 ```
#include <unistd.h>
```

34618 ```
char *getcwd(char *buf, size_t size);
```

34619 **DESCRIPTION**

34620 The *getcwd*( ) function shall place an absolute pathname of the current working directory in the
34621 array pointed to by *buf*, and return *buf*. The pathname shall contain no components that are dot
34622 or dot-dot, or are symbolic links.

34623 If there are multiple pathnames that *getcwd*( ) could place in the array pointed to by *buf*, one
34624 beginning with a single <slash> character and one or more beginning with two <slash>
34625 characters, then *getcwd*( ) shall place the pathname beginning with a single <slash> character in
34626 the array. The pathname shall not contain any unnecessary <slash> characters after the leading
34627 one or two <slash> characters.

34628 The *size* argument is the size in bytes of the character array pointed to by the *buf* argument. If *buf*
34629 is a null pointer, the behavior of *getcwd*( ) is unspecified.

34630 **RETURN VALUE**

34631 Upon successful completion, *getcwd*( ) shall return the *buf* argument. Otherwise, *getcwd*( ) shall
34632 return a null pointer and set *errno* to indicate the error. The contents of the array pointed to by
34633 *buf* are then undefined.

34634 **ERRORS**

34635 The *getcwd*( ) function shall fail if:

34636 [EINVAL] The *size* argument is 0.

34637 [ERANGE] The *size* argument is greater than 0, but is smaller than the length of the string
34638 +1.

34639 The *getcwd*( ) function may fail if:

34640 [EACCES] Search permission was denied for the current directory, or read or search
34641 permission was denied for a directory above the current directory in the file
34642 hierarchy.

34643 [ENOMEM] Insufficient storage space is available.

34644 **EXAMPLES**

34645 The following example uses {PATH_MAX} as the initial buffer size (unless it is indeterminate or
34646 very large), and calls *getcwd*( ) with progressively larger buffers until it does not give an
34647 [ERANGE] error.

34648 ```
#include <stdlib.h>
34649 #include <errno.h>
34650 #include <unistd.h>

34651 ...

34652 long path_max;
34653 size_t size;
34654 char *buf;
34655 char *ptr;

34656 path_max = pathconf(".", _PC_PATH_MAX);
34657 if (path_max == -1)
```

  
```

```
        size = 1024;
    else if (path_max > 10240)
        size = 10240;
    else
        size = path_max;

    for (buf = ptr = NULL; ptr == NULL; size *= 2)
    {
        if ((buf = realloc(buf, size)) == NULL)
        {
            ... handle error ...
        }

        ptr = getcwd(buf, size);
        if (ptr == NULL && errno != ERANGE)
        {
            ... handle error ...
        }
    }
    ...
    free (buf);
```

APPLICATION USAGE

If the pathname obtained from *getcwd*() is longer than {PATH_MAX} bytes, it could produce an [ENAMETOOLONG] error if passed to *chdir*(). Therefore, in order to return to that directory it may be necessary to break the pathname into sections shorter than {PATH_MAX} bytes and call *chdir*() on each section in turn (the first section being an absolute pathname and subsequent sections being relative pathnames). A simpler way to handle saving and restoring the working directory when it may be deeper than {PATH_MAX} bytes in the file hierarchy is to use a file descriptor and *fchdir*(), rather than *getcwd*() and *chdir*(). However, the two methods do have some differences. The *fchdir*() approach causes the program to restore a working directory even if it has been renamed in the meantime, whereas the *chdir*() approach restores to a directory with the same name as the original, even if the directories were renamed in the meantime. Since the *fchdir*() approach does not access parent directories, it can succeed when *getcwd*() would fail due to permissions problems. In applications conforming to earlier versions of this standard, it was not possible to use the *fchdir*() approach when the working directory is searchable but not readable, as the only way to open a directory was with O_RDONLY, whereas the *getcwd*() approach can succeed in this case.

RATIONALE

Having *getcwd*() take no arguments and instead use the *malloc*() function to produce space for the returned argument was considered. The advantage is that *getcwd*() knows how big the working directory pathname is and can allocate an appropriate amount of space. But the programmer would have to use the *free*() function to free the resulting object, or each use of *getcwd*() would further reduce the available memory. Finally, *getcwd*() is taken from the SVID where it has the two arguments used in this volume of POSIX.1-2017.

The older function *getwd*() was rejected for use in this context because it had only a buffer argument and no *size* argument, and thus had no way to prevent overwriting the buffer, except to depend on the programmer to provide a large enough buffer.

On some implementations, if *buf* is a null pointer, *getcwd*() may obtain *size* bytes of memory using *malloc*(). In this case, the pointer returned by *getcwd*() may be used as the argument in a subsequent call to *free*(). Invoking *getcwd*() with *buf* as a null pointer is not recommended in conforming applications.

Earlier implementations of *getcwd*( ) sometimes generated pathnames like `"../../../subdirname"` internally, using them to explore the path of ancestor directories back to the root. If one of these internal pathnames exceeded {PATH_MAX} in length, the implementation could fail with *errno* set to [ENAMETOOLONG]. This is no longer allowed.

If a program is operating in a directory where some (grand)parent directory does not permit reading, *getcwd*( ) may fail, as in most implementations it must read the directory to determine the name of the file. This can occur if search, but not read, permission is granted in an intermediate directory, or if the program is placed in that directory by some more privileged process (for example, login). Including the [EACCES] error condition makes the reporting of the error consistent and warns the application developer that *getcwd*( ) can fail for reasons beyond the control of the application developer or user. Some implementations can avoid this occurrence (for example, by implementing *getcwd*( ) using *pwd*, where *pwd* is a set-user-root process), thus the error was made optional. Since this volume of POSIX.1-2017 permits the addition of other errors, this would be a common addition and yet one that applications could not be expected to deal with without this addition.

FUTURE DIRECTIONS

None.

SEE ALSO

malloc( )

XBD **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ENOMEM] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #140 is applied, changing the text for consistency with the *pwd* utility, adding text to address the case where the current directory is deeper in the file hierarchy than {PATH_MAX} bytes, and adding the requirements relating to pathnames beginning with two <slash> characters.

34738 **NAME**

34739 getdate ‡'convert user format date and time

34740 **SYNOPSIS**

34741 XSI
```
#include <time.h>

struct tm *getdate(const char *string);
```
34742

34743 **DESCRIPTION**

34744 The *getdate*( ) function shall convert a string representation of a date or time into a broken-down
34745 time.

34746 The external variable or macro *getdate_err*, which has type **int**, is used by *getdate*( ) to return error
34747 values. It is unspecified whether *getdate_err* is a macro or an identifier declared with external
34748 linkage, and whether or not it is a modifiable lvalue. If a macro definition is suppressed in order
34749 to access an actual object, or a program defines an identifier with the name *getdate_err*, the
34750 behavior is undefined.

34751 Templates are used to parse and interpret the input string. The templates are contained in a text
34752 file identified by the environment variable *DATEMSK*. The *DATEMSK* variable should be set to
34753 indicate the full pathname of the file that contains the templates. The first line in the template
34754 that matches the input specification is used for interpretation and conversion into the internal
34755 time format.

34756 The following conversion specifications shall be supported:

34757 `%%` Equivalent to `%`.

34758 `%a` Abbreviated weekday name.

34759 `%A` Full weekday name.

34760 `%b` Abbreviated month name.

34761 `%B` Full month name.

34762 `%c` Locale's appropriate date and time representation.

34763 `%C` Century number [00,99]; leading zeros are permitted but not required.

34764 `%d` Day of month [01,31]; the leading 0 is optional.

34765 `%D` Date as `%m/%d/%y`.

34766 `%e` Equivalent to `%d`.

34767 `%h` Abbreviated month name.

34768 `%H` Hour [00,23].

34769 `%I` Hour [01,12].

34770 `%m` Month number [01,12].

34771 `%M` Minute [00,59].

34772 `%n` Equivalent to <newline>.

34773 `%p` Locale's equivalent of either AM or PM.

34774 `%r` The locale's appropriate representation of time in AM and PM notation. In the POSIX
34775 locale, this shall be equivalent to `%I:%M:%S %p`.

34776 `%R` Time as `%H:%M`.

34777 `%S` Seconds [00,60]. The range goes to 60 (rather than stopping at 59) to allow positive leap
34778 seconds to be expressed. Since leap seconds cannot be predicted by any algorithm, leap
34779 second data must come from some external source.

34780 `%t` Equivalent to <tab>.

34781 `%T` Time as `%H:%M:%S`.

34782 `%w` Weekday number (Sunday = [0,6]).

34783 `%x` Locale's appropriate date representation.

34784 `%X` Locale's appropriate time representation.

34785 `%y` Year within century. When a century is not otherwise specified, values in the range
34786 [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall
34787 refer to years 2000 to 2068 inclusive.

34788 **Note:** It is expected that in a future version of this standard the default century inferred
34789 from a 2-digit year will change. (This would apply to all commands accepting a
34790 2-digit year as input.)

34791 `%Y` Year as "`ccyy`" (for example, 2001).

34792 `%Z` Timezone name or no characters if no timezone exists. If the timezone supplied by `%Z` is
34793 not the timezone that *getdate*( ) expects, an invalid input specification error shall result.
34794 The *getdate*( ) function calculates an expected timezone based on information supplied
34795 to the function (such as the hour, day, and month).

34796 The match between the template and input specification performed by *getdate*( ) shall be case-
34797 insensitive.

34798 The month and weekday names can consist of any combination of upper and lowercase letters.
34799 The process can request that the input date or time specification be in a specific language by
34800 setting the *LC_TIME* category (see *setlocale*( )).

34801 Leading zeros are not necessary for the descriptors that allow leading zeros. However, at most
34802 two digits are allowed for those descriptors, including leading zeros. Extra white space in either
34803 the template file or in *string* shall be ignored.

34804 The results are undefined if the conversion specifications `%c`, `%x`, and `%X` include unsupported
34805 conversion specifications.

34806 The following rules apply for converting the input specification into the internal format:

34807 If `%Z` is being scanned, then *getdate*( ) shall initialize the broken-down time to be the current
34808 time in the scanned timezone. Otherwise, it shall initialize the broken-down time based on
34809 the current local time as if *localtime*( ) had been called.

34810 If only the weekday is given, the day chosen shall be the day, starting with today and
34811 moving into the future, which first matches the named day.

34812 If only the month (and no year) is given, the month chosen shall be the month, starting
34813 with the current month and moving into the future, which first matches the named month.
34814 The first day of the month shall be assumed if no day is given.

34815 If no hour, minute, and second are given, the current hour, minute, and second shall be
34816 assumed.

34817 If no date is given, the hour chosen shall be the hour, starting with the current hour and
34818 moving into the future, which first matches the named hour.

34819 If a conversion specification in the DATEMSK file does not correspond to one of the conversion
34820 specifications above, the behavior is unspecified.

34821 The *getdate*( ) function need not be thread-safe.

34822 **RETURN VALUE**

34823 Upon successful completion, *getdate*( ) shall return a pointer to a **struct tm**. Otherwise, it shall
34824 return a null pointer and set *getdate_err* to indicate the error.

34825 **ERRORS**

34826 The *getdate*( ) function shall fail in the following cases, setting *getdate_err* to the value shown in
34827 the list below. Any changes to *errno* are unspecified.

34828 1. The *DATEMSK* environment variable is null or undefined.

34829 2. The template file cannot be opened for reading.

34830 3. Failed to get file status information.

34831 4. The template file is not a regular file.

34832 5. An I/O error is encountered while reading the template file.

34833 6. Memory allocation failed (not enough memory available).

34834 7. There is no line in the template that matches the input.

34835 8. Invalid input specification. For example, February 31; or a time is specified that cannot be
34836 represented in a **time_t** (representing the time in seconds since the Epoch).

34837 **EXAMPLES**

34838 1. The following example shows the possible contents of a template:

```
34839 %m
34840 %A %B %d, %Y, %H:%M:%S
34841 %A
34842 %B
34843 %m/%d/%y %I %p
34844 %d,%m,%Y %H:%M
34845 at %A the %dst of %B in %Y
34846 run job at %I %p,%B %dnd
34847 %A den %d. %B %Y %H.%M Uhr
```

34848 2. The following are examples of valid input specifications for the template in Example 1:

```
34849 getdate("10/1/87 4 PM");
34850 getdate("Friday");
34851 getdate("Friday September 18, 1987, 10:30:30");
34852 getdate("24,9,1986 10:30");
34853 getdate("at monday the 1st of december in 1986");
34854 getdate("run job at 3 PM, december 2nd");
```

34855 If the *LC_TIME* category is set to a German locale that includes *freitag* as a weekday name
34856 and *oktober* as a month name, the following would be valid:

```
34857 getdate("freitag den 10. oktober 1986 10.30 Uhr");
```

3. The following example shows how local date and time specification can be defined in the template:

Invocation	Line in Template
`getdate("11/27/86")`	`%m/%d/%y`
`getdate("27.11.86")`	`%d.%m.%y`
`getdate("86-11-27")`	`%y-%m-%d`
`getdate("Friday 12:00:00")`	`%A %H:%M:%S`

4. The following examples help to illustrate the above rules assuming that the current date is Mon Sep 22 12:19:47 EDT 1986 and the *LC_TIME* category is set to the default C or POSIX locale:

Input	Line in Template	Date
`Mon`	`%a`	Mon Sep 22 12:19:47 EDT 1986
`Sun`	`%a`	Sun Sep 28 12:19:47 EDT 1986
`Fri`	`%a`	Fri Sep 26 12:19:47 EDT 1986
`September`	`%B`	Mon Sep 1 12:19:47 EDT 1986
`January`	`%B`	Thu Jan 1 12:19:47 EST 1987

APPLICATION USAGE

Although historical versions of *getdate*( ) did not require that **<time.h>** declare the external variable *getdate_err*, this volume of POSIX.1-2017 does require it. The standard developers encourage applications to remove declarations of *getdate_err* and instead incorporate the declaration by including **<time.h>**.

Applications should use `%Y` (4-digit years) in preference to `%y` (2-digit years).

RATIONALE

In standard locales, the conversion specifications `%c`, `%x`, and `%X` do not include unsupported conversion specifiers and so the text regarding results being undefined is not a problem in that case.

FUTURE DIRECTIONS

None.

SEE ALSO

ctime( ), *localtime*( ), *setlocale*( ), *strftime*( ), *times*( )

XBD **<time.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The last paragraph of the DESCRIPTION is added.

The `%C` conversion specification is added, and the exact meaning of the `%y` conversion specification is clarified in the DESCRIPTION.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

The `%R` conversion specification is changed to follow historical practice.

Issue 6

The DESCRIPTION is updated to refer to ``seconds since the Epoch'' rather than ``seconds since 00:00:00 UTC (Coordinated Universal Time), January 1 1970'' for consistency with other *time* functions.

The description of `%S` is updated so that the valid range is [00,60] rather than [00,61].

The DESCRIPTION is updated to refer to conversion specifications instead of field descriptors for consistency with other functions.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

The description of the *getdate_err* value is expanded.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0152 [796] is applied.

NAME

getdelim, getline — read a delimited record from *stream*

SYNOPSIS

CX
```
#include <stdio.h>

ssize_t getdelim(char **restrict lineptr, size_t *restrict n,
    int delimiter, FILE *restrict stream);
ssize_t getline(char **restrict lineptr, size_t *restrict n,
    FILE *restrict stream);
```

DESCRIPTION

The *getdelim*( ) function shall read from *stream* until it encounters a character matching the *delimiter* character. The *delimiter* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** of equal value that terminates the read process. If the *delimiter* argument has any other value, the behavior is undefined.

The application shall ensure that **lineptr* is a valid argument that could be passed to the *free*( ) function. If **n* is non-zero, the application shall ensure that **lineptr* either points to an object of size at least **n* bytes, or is a null pointer.

If **lineptr* is a null pointer or if the object pointed to by **lineptr* is of insufficient size, an object shall be allocated as if by *malloc*( ) or the object shall be reallocated as if by *realloc*( ), respectively, such that the object is large enough to hold the characters to be written to it, including the terminating NUL, and **n* shall be set to the new size. If the object was allocated, or if the reallocation operation moved the object, **lineptr* shall be updated to point to the new object or new location. The characters read, including any delimiter, shall be stored in the object, and a terminating NUL added when the delimiter or end-of-file is encountered.

The *getline*( ) function shall be equivalent to the *getdelim*( ) function with the *delimiter* character equal to the <newline> character.

The *getdelim*( ) and *getline*( ) functions may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *getdelim*( ), *getline*( ), *gets*( ), or *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ).

RETURN VALUE

Upon successful completion, the *getline*( ) and *getdelim*( ) functions shall return the number of bytes written into the buffer, including the delimiter character if one was encountered before EOF, but excluding the terminating NUL character. If the end-of-file indicator for the stream is set, or if no characters were read and the stream is at end-of-file, the end-of-file indicator for the stream shall be set and the function shall return –1. If an error occurs, the error indicator for the stream shall be set, and the function shall return –1 and set *errno* to indicate the error.

ERRORS

For the conditions under which the *getdelim*( ) and *getline*( ) functions shall fail and may fail, refer to *fgetc*( ).

In addition, these functions shall fail if:

[EINVAL] *lineptr* or *n* is a null pointer.

[ENOMEM] Insufficient memory is available.

These functions may fail if:

[EOVERFLOW] The number of bytes to be written into the buffer, including the delimiter character (if encountered), would exceed {SSIZE_MAX}.

EXAMPLES

```
#include <stdio.h>
#include <stdlib.h>

int main(void)
{
    FILE *fp;
    char *line = NULL;
    size_t len = 0;
    ssize_t read;
    fp = fopen("/etc/motd", "r");
    if (fp == NULL)
        exit(1);
    while ((read = getline(&line, &len, fp)) != -1) {
        printf("Retrieved line of length %zu :\n", read);
        printf("%s", line);
    }
    if (ferror(fp)) {
        /* handle error */
    }
    free(line);
    fclose(fp);
    return 0;
}
```

APPLICATION USAGE

Setting **lineptr* to a null pointer and **n* to zero are allowed and a recommended way to start parsing a file.

The *ferror*( ) or *feof*( ) functions should be used to distinguish between an error condition and an end-of-file condition.

Although a NUL terminator is always supplied after the line, note that *strlen*(**lineptr*) will be smaller than the return value if the line contains embedded NUL characters.

RATIONALE

These functions are widely used to solve the problem that the *fgets*( ) function has with long lines. The functions automatically enlarge the target buffers if needed. These are especially useful since they reduce code needed for applications.

FUTURE DIRECTIONS

None.

35006 and XSH/TC2-2008/0155 [570] are applied.

35007 **NAME**

35008 getegid — get the effective group ID

35009 **SYNOPSIS**

35010 `#include <unistd.h>`

35011 `gid_t getegid(void);`

35012 **DESCRIPTION**

35013 The *getegid*( ) function shall return the effective group ID of the calling process. The *getegid*( )
35014 function shall not modify *errno*.

35015 **RETURN VALUE**

35016 The *getegid*( ) function shall always be successful and no return value is reserved to indicate an
35017 error.

35018 **ERRORS**

35019 No errors are defined.

35020 **EXAMPLES**

35021 None.

35022 **APPLICATION USAGE**

35023 None.

35024 **RATIONALE**

35025 In a conforming environment, *getegid*( ) will always succeed. It is possible for implementations to
35026 provide an extension where a process in a non-conforming environment will not be associated
35027 with a user or group ID. It is recommended that such implementations return (**gid_t**)–1 and set
35028 *errno* to indicate such an environment; doing so does not violate this standard, since such an
35029 environment is already an extension.

35030 **FUTURE DIRECTIONS**

35031 None.

35035 **CHANGE HISTORY**

35036 First released in Issue 1. Derived from Issue 1 of the SVID.

35037 **Issue 6**

35038 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

35039 The following new requirements on POSIX implementations derive from alignment with the
35040 Single UNIX Specification:

35041 — The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
35042 required for conforming implementations of previous POSIX specifications, it was not
35043 required for UNIX applications.

35044 **Issue 7**

35045 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0156 [511] is applied.

NAME

getenv — get value of an environment variable

SYNOPSIS

```
#include <stdlib.h>

char *getenv(const char *name);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *getenv*( ) function shall search the environment of the calling process (see XBD Chapter 8, on page 173) for the environment variable *name* if it exists and return a pointer to the value of the environment variable. If the specified environment variable cannot be found, a null pointer shall be returned. The application shall ensure that it does not modify the string pointed to by the *getenv*( ) function.

CX The returned string pointer might be invalidated or the string content might be overwritten by a CX subsequent call to *getenv*( ), *setenv*( ), *unsetenv*( ), XSI or (if supported) *putenv*( ) but they shall not be affected by a call to any other function in this volume of POSIX.1-2017.

CX The returned string pointer might also be invalidated if the calling thread is terminated.

CX The *getenv*( ) function need not be thread-safe.

RETURN VALUE

Upon successful completion, *getenv*( ) shall return a pointer to a string containing the *value* for the specified *name*. If the specified *name* cannot be found in the environment of the calling process, a null pointer shall be returned.

ERRORS

No errors are defined.

EXAMPLES

Getting the Value of an Environment Variable

The following example gets the value of the *HOME* environment variable.

```
#include <stdlib.h>
...
const char *name = "HOME";
char *value;

value = getenv(name);
```

APPLICATION USAGE

None.

RATIONALE

The *clearenv*( ) function was considered but rejected. The *putenv*( ) function has now been included for alignment with the Single UNIX Specification.

The *getenv*( ) function is inherently not thread-safe because it returns a value pointing to static data.

Conforming applications are required not to directly modify the pointers to which *environ* points, but to use only the *setenv*( ), *unsetenv*( ), and *putenv*( ) functions, or assignment to *environ*

itself, to manipulate the process environment. This constraint allows the implementation to properly manage the memory it allocates. This enables the implementation to free any space it has allocated to strings (and perhaps the pointers to them) stored in *environ* when *unsetenv*( ) is called. A C runtime start-up procedure (that which invokes *main*( ) and perhaps initializes *environ*) can also initialize a flag indicating that none of the environment has yet been copied to allocated storage, or that the separate table has not yet been initialized. If the application switches to a complete new environment by assigning a new value to *environ*, this can be detected by *getenv*( ), *setenv*( ), *unsetenv*( ), or *putenv*( ) and the implementation can at that point reinitialize based on the new environment. (This may include copying the environment strings into a new array and assigning *environ* to point to it.)

In fact, for higher performance of *getenv*( ), implementations that do not provide *putenv*( ) could also maintain a separate copy of the environment in a data structure that could be searched much more quickly (such as an indexed hash table, or a binary tree), and update both it and the linear list at *environ* when *setenv*( ) or *unsetenv*( ) is invoked. On implementations that do provide *putenv*( ), such a copy might still be worthwhile but would need to allow for the fact that applications can directly modify the content of environment strings added with *putenv*( ). For example, if an environment string found by searching the copy is one that was added using *putenv*( ), the implementation would need to check that the string in *environ* still has the same name (and value, if the copy includes values), and whenever searching the copy produces no match the implementation would then need to search each environment string in *environ* that was added using *putenv*( ) in case any of them have changed their names and now match. Thus, each use of *putenv*( ) to add to the environment would reduce the speed advantage of having the copy.

Performance of *getenv*( ) can be important for applications which have large numbers of environment variables. Typically, applications like this use the environment as a resource database of user-configurable parameters. The fact that these variables are in the user's shell environment usually means that any other program that uses environment variables (such as *ls*, which attempts to use *COLUMNS*), or really almost any utility (*LANG*, *LC_ALL*, and so on) is similarly slowed down by the linear search through the variables.

An implementation that maintains separate data structures, or even one that manages the memory it consumes, is not currently required as it was thought it would reduce consensus among implementors who do not want to change their historical implementations.

FUTURE DIRECTIONS

A future version may add one or more functions to access and modify the environment in a thread-safe manner.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

The following changes were made to align with the IEEE P1003.1a draft standard:

References added to the new *setenv*( ) and *unsetenv*( ) functions.

The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #062 is applied, clarifying that a call to *putenv*( ) may also cause the string to be overwritten.

Austin Group Interpretation 1003.1-2001 #148 is applied, adding the FUTURE DIRECTIONS.

Austin Group Interpretation 1003.1-2001 #156 is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0238 [75,428], XSH/TC1-2008/0239 [167], and XSH/TC1-2008/0240 [167] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0157 [656] is applied.

NAME

geteuid — get the effective user ID

SYNOPSIS

```
#include <unistd.h>

uid_t geteuid(void);
```

DESCRIPTION

The *geteuid*( ) function shall return the effective user ID of the calling process. The *geteuid*( ) function shall not modify *errno*.

RETURN VALUE

The *geteuid*( ) function shall always be successful and no return value is reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

In a conforming environment, *geteuid*( ) will always succeed. It is possible for implementations to provide an extension where a process in a non-conforming environment will not be associated with a user or group ID. It is recommended that such implementations return (**uid_t**)–1 and set *errno* to indicate such an environment; doing so does not violate this standard, since such an environment is already an extension.

35223 **NAME**

35224 getgrent — get the group database entry

35225 **SYNOPSIS**

35226 XSI
```
#include <grp.h>

struct group *getgrent(void);
```
35227

35228 **DESCRIPTION**

35229 Refer to *endgrent( )*.

35230 **NAME**

35231 getgrgid, getgrgid_r — get group database entry for a group ID

35232 **SYNOPSIS**

35233 ```
#include <grp.h>
```

35234 ```
struct group *getgrgid(gid_t gid);
```

35235 ```
int getgrgid_r(gid_t gid, struct group *grp, char *buffer,
```

35236 ```
    size_t bufsize, struct group **result);
```

35237 **DESCRIPTION**

35238 The *getgrgid*( ) function shall search the group database for an entry with a matching *gid*.

35239 The *getgrgid*( ) function need not be thread-safe.

35240 Applications wishing to check for error situations should set *errno* to 0 before calling *getgrgid*( ).
35241 If *getgrgid*( ) returns a null pointer and *errno* is set to non-zero, an error occurred.

35242 The *getgrgid_r*( ) function shall update the **group** structure pointed to by *grp* and store a pointer
35243 to that structure at the location pointed to by *result*. The structure shall contain an entry from
35244 the group database with a matching *gid*. Storage referenced by the group structure is allocated
35245 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to
35246 *sysconf* (_SC_GETGR_R_SIZE_MAX) returns either –1 without changing *errno* or an initial value
35247 suggested for the size of this buffer. A null pointer shall be returned at the location pointed to
35248 by *result* on error or if the requested entry is not found.

35249 **RETURN VALUE**

35250 Upon successful completion, *getgrgid*( ) shall return a pointer to a **struct group** with the structure
35251 defined in **<grp.h>** with a matching entry if one is found. The *getgrgid*( ) function shall return a
35252 null pointer if either the requested entry was not found, or an error occurred. If the requested
35253 entry was not found, *errno* shall not be changed. On error, *errno* shall be set to indicate the error.

35254 The application shall not modify the structure to which the return value points, nor any storage
35255 areas pointed to by pointers within the structure. The returned pointer, and pointers within the
35256 structure, might be invalidated or the structure or the storage areas might be overwritten by a
35257 subsequent call to *getgrent*( ), *getgrgid*( ), or *getgrnam*( ). The returned pointer, and pointers
35258 within the structure, might also be invalidated if the calling thread is terminated.

35259 If successful, the *getgrgid_r*( ) function shall return zero; otherwise, an error number shall be
35260 returned to indicate the error.

35261 **ERRORS**

35262 The *getgrgid*( ) and *getgrgid_r*( ) functions may fail if:

35263 [EIO] An I/O error has occurred.

35264 [EINTR] A signal was caught during *getgrgid*( ).

35265 [EMFILE] All file descriptors available to the process are currently open.

35266 [ENFILE] The maximum allowable number of files is currently open in the system.

35267 The *getgrgid_r*( ) function may fail if:

35268 [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be
35269 referenced by the resulting **group** structure.

EXAMPLES

Note that *sysconf* (_SC_GETGR_R_SIZE_MAX) may return –1 if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with *getgrid_r*( ).

```
long int initlen = sysconf(_SC_GETGR_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct group result;
struct group *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getgrgid_r(42, &result, buffer, len, &resultp)) == ERANGE)
    {
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
    }
if (e != 0)
    ...handle error...
free (buffer);
```

Finding an Entry in the Group Database

The following example uses *getgrgid*( ) to search the group database for a group ID that was previously stored in a **stat** structure, then prints out the group name if it is found. If the group is not found, the program prints the numeric value of the group for the entry.

```
#include <sys/types.h>
#include <grp.h>
#include <stdio.h>
...
struct stat statbuf;
struct group *grp;
...
if ((grp = getgrgid(statbuf.st_gid)) != NULL)
    printf(" %-8.8s", grp->gr_name);
else
    printf(" %-8d", statbuf.st_gid);
...
```

APPLICATION USAGE

The *getgrgid_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return −1 from *sysconf*( ) indicating that there is no maximum for _SC_GETGR_R_SIZE_MAX.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

endgrent( ), *getgrnam*( ), *sysconf*( )

XBD **<grp.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getgrgid_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getgrgid*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getgrgid_r*( ) function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the *gid*.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-166 is applied.

The *getgrgid_r*( ) function is moved from the Thread-Safe Functions option to the Base.

A minor addition is made to the EXAMPLES section, reminding the application developer to free memory allocated as if by *malloc*( ).

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0241 [75] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0160 [808], XSH/TC2-2008/0161 [808], XSH/TC2-2008/0162 [656], and XSH/TC2-2008/0163 [808] are applied.

35364 **NAME**

35365 getgrnam, getgrnam_r — search group database for a name

35366 **SYNOPSIS**

35367
```
#include <grp.h>
```

35368
```
struct group *getgrnam(const char *name);
```
35369
```
int getgrnam_r(const char *name, struct group *grp, char *buffer,
```
35370
```
    size_t bufsize, struct group **result);
```

35371 **DESCRIPTION**

35372 The *getgrnam*( ) function shall search the group database for an entry with a matching *name*.

35373 The *getgrnam*( ) function need not be thread-safe.

35374 Applications wishing to check for error situations should set *errno* to 0 before calling *getgrnam*( ).
35375 If *getgrnam*( ) returns a null pointer and *errno* is set to non-zero, an error occurred.

35376 The *getgrnam_r*( ) function shall update the **group** structure pointed to by *grp* and store a pointer
35377 to that structure at the location pointed to by *result*. The structure shall contain an entry from
35378 the group database with a matching *name*. Storage referenced by the **group** structure is allocated
35379 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to
35380 *sysconf* (_SC_GETGR_R_SIZE_MAX) returns either –1 without changing *errno* or an initial value
35381 suggested for the size of this buffer. A null pointer is returned at the location pointed to by *result*
35382 on error or if the requested entry is not found.

35383 **RETURN VALUE**

35384 The *getgrnam*( ) function shall return a pointer to a **struct group** with the structure defined in
35385 **<grp.h>** with a matching entry if one is found. The *getgrnam*( ) function shall return a null
35386 pointer if either the requested entry was not found, or an error occurred. If the requested entry
35387 was not found, *errno* shall not be changed. On error, *errno* shall be set to indicate the error.

35388 The application shall not modify the structure to which the return value points, nor any storage
35389 areas pointed to by pointers within the structure. The returned pointer, and pointers within the
35390 structure, might be invalidated or the structure or the storage areas might be overwritten by a
35391 subsequent call to *getgrent*( ), *getgrgid*( ), or *getgrnam*( ). The returned pointer, and pointers
35392 within the structure, might also be invalidated if the calling thread is terminated.

35393 The *getgrnam_r*( ) function shall return zero on success or if the requested entry was not found
35394 and no error has occurred. If any error has occurred, an error number shall be returned to
35395 indicate the error.

35396 **ERRORS**

35397 The *getgrnam*( ) and *getgrnam_r*( ) functions may fail if:

35398 [EIO] An I/O error has occurred.

35399 [EINTR] A signal was caught during *getgrnam*( ).

35400 [EMFILE] All file descriptors available to the process are currently open.

35401 [ENFILE] The maximum allowable number of files is currently open in the system.

35402 The *getgrnam_r*( ) function may fail if:

35403 [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be
35404 referenced by the resulting **group** structure.

EXAMPLES

Note that *sysconf*(_SC_GETGR_R_SIZE_MAX) may return –1 if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with *getgrnam_r*( ).

```
long int initlen = sysconf(_SC_GETGR_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct group result;
struct group *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getgrnam_r("somegroup", &result, buffer, len, &resultp))
        == ERANGE)
    {
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
    }
if (e != 0)
    ...handle error...
free (buffer);
```

APPLICATION USAGE

The *getgrnam_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return –1 from *sysconf*( ) indicating that there is no maximum for _SC_GETGR_R_SIZE_MAX.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getgrnam_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getgrnam*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getgrnam_r*( ) function is marked as part of the Thread-Safe Functions option.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

Issue 7

Austin Group Interpretation 1003.1-2001 #081 is applied, clarifying the RETURN VALUE section.

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-166 is applied.

The *getgrnam_r*( ) function is moved from the Thread-Safe Functions option to the Base.

A minor addition is made to the EXAMPLES section, reminding the application developer to free memory allocated as if by *malloc*( ).

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0242 [75] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0164 [808], XSH/TC2-2008/0165 [808], XSH/TC2-2008/0166 [656], and XSH/TC2-2008/0167 [808] are applied.

NAME

getgroups — get supplementary group IDs

SYNOPSIS

```
#include <unistd.h>

int getgroups(int gidsetsize, gid_t grouplist[]);
```

DESCRIPTION

The *getgroups*( ) function shall fill in the array *grouplist* with the current supplementary group IDs of the calling process. It is implementation-defined whether *getgroups*( ) also returns the effective group ID in the *grouplist* array.

The *gidsetsize* argument specifies the number of elements in the array *grouplist*. The actual number of group IDs stored in the array shall be returned. The values of array entries with indices greater than or equal to the value returned are undefined.

If *gidsetsize* is 0, *getgroups*( ) shall return the number of group IDs that it would otherwise return without modifying the array pointed to by *grouplist*.

If the effective group ID of the process is returned with the supplementary group IDs, the value returned shall always be greater than or equal to one and less than or equal to the value of {NGROUPS_MAX}+1.

RETURN VALUE

Upon successful completion, the number of supplementary group IDs shall be returned. A return value of –1 indicates failure and *errno* shall be set to indicate the error.

ERRORS

The *getgroups*( ) function shall fail if:

[EINVAL] The *gidsetsize* argument is non-zero and less than the number of group IDs that would have been returned.

EXAMPLES

Getting the Supplementary Group IDs of the Calling Process

The following example places the current supplementary group IDs of the calling process into the *group* array.

```
#include <sys/types.h>
#include <unistd.h>
...
gid_t *group;
int nogroups;
long ngroups_max;

ngroups_max = sysconf(_SC_NGROUPS_MAX) + 1;
group = (gid_t *)malloc(ngroups_max *sizeof(gid_t));

ngroups = getgroups(ngroups_max, group);
```

APPLICATION USAGE

None.

RATIONALE

The related function *setgroups*( ) is a privileged operation and therefore is not covered by this volume of POSIX.1-2017.

As implied by the definition of supplementary groups, the effective group ID may appear in the

array returned by *getgroups*( ) or it may be returned only by *getegid*( ). Duplication may exist, but the application needs to call *getegid*( ) to be sure of getting all of the information. Various implementation variations and administrative sequences cause the set of groups appearing in the result of *getgroups*( ) to vary in order and as to whether the effective group ID is included, even when the set of groups is the same (in the mathematical sense of ``set''). (The history of a process and its parents could affect the details of the result.)

Application developers should note that {NGROUPS_MAX} is not necessarily a constant on all implementations.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

- A return value of 0 is not permitted, because {NGROUPS_MAX} cannot be 0. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

- An explanation is added that the effective group ID may be included in the supplementary group list.

35556 **NAME**

35557 gethostent ‡'network host database functions

35558 **SYNOPSIS**

35559 `#include <netdb.h>`

35560 `struct hostent *gethostent(void);`

35561 **DESCRIPTION**

35562 Refer to *endhostent( )*.

35563 **NAME**

35564 gethostid — get an identifier for the current host

35565 **SYNOPSIS**

35566 XSI
```
#include <unistd.h>

long gethostid(void);
```
35567

35568 **DESCRIPTION**

35569 The *gethostid*( ) function shall retrieve a 32-bit identifier for the current host.

35570 **RETURN VALUE**

35571 Upon successful completion, *gethostid*( ) shall return an identifier for the current host.

35572 **ERRORS**

35573 No errors are defined.

35574 **EXAMPLES**

35575 None.

35576 **APPLICATION USAGE**

35577 This volume of POSIX.1-2017 does not define the domain in which the return value is unique.

35589 **NAME**

35590 gethostname — get name of current host

35591 **SYNOPSIS**

35592 ```
#include <unistd.h>
```

35593 ```
int gethostname(char *name, size_t namelen);
```

35594 **DESCRIPTION**

35595 The *gethostname*( ) function shall return the standard host name for the current machine. The
35596 *namelen* argument shall specify the size of the array pointed to by the *name* argument. The
35597 returned name shall be null-terminated, except that if *namelen* is an insufficient length to hold
35598 the host name, then the returned name shall be truncated and it is unspecified whether the
35599 returned name is null-terminated.

35600 Host names are limited to {HOST_NAME_MAX} bytes.

35601 **RETURN VALUE**

35602 Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned.

35603 **ERRORS**

35604 No errors are defined.

35605 **EXAMPLES**

35606 None.

35607 **APPLICATION USAGE**

35608 None.

35609 **RATIONALE**

35610 None.

35611 **FUTURE DIRECTIONS**

35612 None.

35613 **SEE ALSO**

35614 *gethostid*( ), *uname*( )

35615 XBD **<unistd.h>**

35616 **CHANGE HISTORY**

35617 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

35618 The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter from
35619 **socklen_t** to **size_t**.

35620 **NAME**

35621 getitimer, setitimer ‡'get and set value of interval timer

35622 **SYNOPSIS**

35623 OB XSI
```
#include <sys/time.h>

int getitimer(int which, struct itimerval *value);
int setitimer(int which, const struct itimerval *restrict value,
    struct itimerval *restrict ovalue);
```

35627 **DESCRIPTION**

35628 The *getitimer*( ) function shall store the current value of the timer specified by *which* into the
35629 structure pointed to by *value*. The *setitimer*( ) function shall set the timer specified by *which* to the
35630 value specified in the structure pointed to by *value*, and if *ovalue* is not a null pointer, store the
35631 previous value of the timer in the structure pointed to by *ovalue*.

35632 A timer value is defined by the **itimerval** structure, specified in **<sys/time.h>**. If *it_value* is non-
35633 zero, it shall indicate the time to the next timer expiration. If *it_interval* is non-zero, it shall
35634 specify a value to be used in reloading *it_value* when the timer expires. Setting *it_value* to 0 shall
35635 disable a timer, regardless of the value of *it_interval*. Setting *it_interval* to 0 shall disable a timer
35636 after its next expiration (assuming *it_value* is non-zero).

35637 Implementations may place limitations on the granularity of timer values. For each interval
35638 timer, if the requested timer value requires a finer granularity than the implementation supports,
35639 the actual timer value shall be rounded up to the next supported value.

35640 An XSI-conforming implementation provides each process with at least three interval timers,
35641 which are indicated by the *which* argument:

35642 ITIMER_PROF Decrements both in process virtual time and when the system is running
35643 on behalf of the process. It is designed to be used by interpreters in
35644 statistically profiling the execution of interpreted programs. Each time the
35645 ITIMER_PROF timer expires, the SIGPROF signal is delivered.

35646 ITIMER_REAL Decrements in real time. A SIGALRM signal is delivered when this timer
35647 expires.

35648 ITIMER_VIRTUAL Decrements in process virtual time. It runs only when the process is
35649 executing. A SIGVTALRM signal is delivered when it expires.

35650 The interaction between *setitimer*( ) and *alarm*( ) or *sleep*( ) is unspecified.

35651 **RETURN VALUE**

35652 Upon successful completion, *getitimer*( ) or *setitimer*( ) shall return 0; otherwise, −1 shall be
35653 returned and *errno* set to indicate the error.

35654 **ERRORS**

35655 The *setitimer*( ) function shall fail if:

35656 [EINVAL] The *value* argument is not in canonical form. (In canonical form, the number of
35657 microseconds is a non-negative integer less than 1 000 000 and the number of
35658 seconds is a non-negative integer.)

35659 The *getitimer*( ) and *setitimer*( ) functions may fail if:

35660 [EINVAL] The *which* argument is not recognized.

35661 **EXAMPLES**

35662 None.

35663 **APPLICATION USAGE**

35664 Applications should use the *timer_gettime*( ) and *timer_settime*( ) functions instead of the
35665 obsolescent *getitimer*( ) and *setitimer*( ) functions, respectively.

35666 **RATIONALE**

35667 None.

35668 **FUTURE DIRECTIONS**

35669 The *getitimer*( ) and *setitimer*( ) functions may be removed in a future version.

35670 **SEE ALSO**

35671 *alarm*( ), *exec*, *sleep*( ), *timer_getoverrun*( )

35672 XBD **<signal.h>**, **<sys/time.h>**

35673 **CHANGE HISTORY**

35674 First released in Issue 4, Version 2.

35675 **Issue 5**

35676 Moved from X/OPEN UNIX extension to BASE.

35677 **Issue 6**

35678 The **restrict** keyword is added to the *setitimer*( ) prototype for alignment with the
35679 ISO/IEC 9899: 1999 standard.

35680 **Issue 7**

35681 The *getitimer*( ) and *setitimer*( ) functions are marked obsolescent.

35682 **NAME**

35683 getline — read a delimited record from *stream*

35684 **SYNOPSIS**

35685 CX
```
#include <stdio.h>

ssize_t getline(char **restrict lineptr, size_t *restrict n,
    FILE *restrict stream);
```

35688 **DESCRIPTION**

35689 Refer to *getdelim( )*.

35690 **NAME**

35691 getlogin, getlogin_r ‡'get login name

35692 **SYNOPSIS**

35693 ```
#include <unistd.h>
```

35694 ```
char *getlogin(void);
```

35695 ```
int getlogin_r(char *name, size_t namesize);
```

35696 **DESCRIPTION**

35697 The *getlogin*( ) function shall return a pointer to a string containing the user name associated by
35698 the login activity with the controlling terminal of the current process. If *getlogin*( ) returns a non-
35699 null pointer, then that pointer points to the name that the user logged in under, even if there are
35700 several login names with the same user ID.

35701 The *getlogin*( ) function need not be thread-safe.

35702 The *getlogin_r*( ) function shall put the name associated by the login activity with the controlling
35703 terminal of the current process in the character array pointed to by *name*. The array is *namesize*
35704 characters long and should have space for the name and the terminating null character. The
35705 maximum size of the login name is {LOGIN_NAME_MAX}.

35706 If *getlogin_r*( ) is successful, *name* points to the name the user used at login, even if there are
35707 several login names with the same user ID.

35708 The *getlogin*( ) and *getlogin_r*( ) functions may make use of file descriptors 0, 1, and 2 to find the
35709 controlling terminal of the current process, examining each in turn until the terminal is found. If
35710 in this case none of these three file descriptors is open to the controlling terminal, these functions
35711 may fail. The method used to find the terminal associated with a file descriptor may depend on
35712 the file descriptor being open to the actual terminal device, not **/dev/tty**.

35713 **RETURN VALUE**

35714 Upon successful completion, *getlogin*( ) shall return a pointer to the login name or a null pointer
35715 if the user's login name cannot be found. Otherwise, it shall return a null pointer and set *errno* to
35716 indicate the error.

35717 The application shall not modify the string returned. The returned pointer might be invalidated
35718 or the string content might be overwritten by a subsequent call to *getlogin*( ). The returned
35719 pointer and the string content might also be invalidated if the calling thread is terminated.

35720 If successful, the *getlogin_r*( ) function shall return zero; otherwise, an error number shall be
35721 returned to indicate the error.

35722 **ERRORS**

35723 These functions may fail if:

35724 [EMFILE] All file descriptors available to the process are currently open.

35725 [ENFILE] The maximum allowable number of files is currently open in the system.

35726 [ENOTTY] None of the file descriptors 0, 1, or 2 is open to the controlling terminal of the
35727 current process.

35728 [ENXIO] The calling process has no controlling terminal.

35729 The *getlogin_r*( ) function may fail if:

35730 [ERANGE] The value of *namesize* is smaller than the length of the string to be returned
35731 including the terminating null character.

  
```

EXAMPLES

Getting the User Login Name

The following example calls the *getlogin*( ) function to obtain the name of the user associated with the calling process, and passes this information to the *getpwnam*( ) function to get the associated user database information.

```
#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
#include <stdio.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
    }
```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid*(*geteuid*( )) shall return the name associated with the effective user ID of the process; *getlogin*( ) shall return the name associated with the current login activity; and *getpwuid*(*getuid*( )) shall return the name associated with the real user ID of the process.

The *getlogin_r*( ) function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

The *getlogin*( ) function returns a pointer to the user's login name. The same user ID may be shared by several login names. If it is desired to get the user database entry that is used during login, the result of *getlogin*( ) should be used to provide the argument to the *getpwnam*( ) function. (This might be used to determine the user's login shell, particularly where a single user has multiple login shells with distinct login names, but the same user ID.)

The information provided by the *cuserid*( ) function, which was originally defined in the POSIX.1-1988 standard and subsequently removed, can be obtained by the following:

```
getpwuid(geteuid())
```

while the information provided by historical implementations of *cuserid*( ) can be obtained by:

```
getpwuid(getuid())
```

The thread-safe version of this function places the user name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.

FUTURE DIRECTIONS

None.

35796 and XSH/TC1-2008/0245 [172] are applied.

35797 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0168 [656] is applied.

NAME

getmsg, getpmsg — receive next message from a STREAMS file (**STREAMS**)

SYNOPSIS

OB XSR

```
#include <stropts.h>

int getmsg(int fildes, struct strbuf *restrict ctlptr,
    struct strbuf *restrict dataptr, int *restrict flagsp);
int getpmsg(int fildes, struct strbuf *restrict ctlptr,
    struct strbuf *restrict dataptr, int *restrict bandp,
    int *restrict flagsp);
```

DESCRIPTION

The *getmsg*( ) function shall retrieve the contents of a message located at the head of the STREAM head read queue associated with a STREAMS file and place the contents into one or more buffers. The message contains either a data part, a control part, or both. The data and control parts of the message shall be placed into separate buffers, as described below. The semantics of each part are defined by the originator of the message.

The *getpmsg*( ) function shall be equivalent to *getmsg*( ), except that it provides finer control over the priority of the messages received. Except where noted, all requirements on *getmsg*( ) also pertain to *getpmsg*( ).

The *fildes* argument specifies a file descriptor referencing a STREAMS-based file.

The *ctlptr* and *dataptr* arguments each point to a **strbuf** structure, in which the *buf* member points to a buffer in which the data or control information is to be placed, and the *maxlen* member indicates the maximum number of bytes this buffer can hold. On return, the *len* member shall contain the number of bytes of data or control information actually received. The *len* member shall be set to 0 if there is a zero-length control or data part and *len* shall be set to −1 if no data or control information is present in the message.

When *getmsg*( ) is called, *flagsp* should point to an integer that indicates the type of message the process is able to receive. This is described further below.

The *ctlptr* argument is used to hold the control part of the message, and *dataptr* is used to hold the data part of the message. If *ctlptr* (or *dataptr*) is a null pointer or the *maxlen* member is −1, the control (or data) part of the message shall not be processed and shall be left on the STREAM head read queue, and if the *ctlptr* (or *dataptr*) is not a null pointer, *len* shall be set to −1. If the *maxlen* member is set to 0 and there is a zero-length control (or data) part, that zero-length part shall be removed from the read queue and *len* shall be set to 0. If the *maxlen* member is set to 0 and there are more than 0 bytes of control (or data) information, that information shall be left on the read queue and *len* shall be set to 0. If the *maxlen* member in *ctlptr* (or *dataptr*) is less than the control (or data) part of the message, *maxlen* bytes shall be retrieved. In this case, the remainder of the message shall be left on the STREAM head read queue and a non-zero return value shall be provided.

By default, *getmsg*( ) shall process the first available message on the STREAM head read queue. However, a process may choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to RS_HIPRI. In this case, *getmsg*( ) shall only process the next message if it is a high-priority message. When the integer pointed to by *flagsp* is 0, any available message shall be retrieved. In this case, on return, the integer pointed to by *flagsp* shall be set to RS_HIPRI if a high-priority message was retrieved, or 0 otherwise.

For *getpmsg*( ), the flags are different. The *flagsp* argument points to a bitmask with the following mutually-exclusive flags defined: MSG_HIPRI, MSG_BAND, and MSG_ANY. Like *getmsg*( ),

getpmsg( ) shall process the first available message on the STREAM head read queue. A process may choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to MSG_HIPRI and the integer pointed to by *bandp* to 0. In this case, *getpmsg*( ) shall only process the next message if it is a high-priority message. In a similar manner, a process may choose to retrieve a message from a particular priority band by setting the integer pointed to by *flagsp* to MSG_BAND and the integer pointed to by *bandp* to the priority band of interest. In this case, *getpmsg*( ) shall only process the next message if it is in a priority band equal to, or greater than, the integer pointed to by *bandp*, or if it is a high-priority message. If a process wants to get the first message off the queue, the integer pointed to by *flagsp* should be set to MSG_ANY and the integer pointed to by *bandp* should be set to 0. On return, if the message retrieved was a high-priority message, the integer pointed to by *flagsp* shall be set to MSG_HIPRI and the integer pointed to by *bandp* shall be set to 0. Otherwise, the integer pointed to by *flagsp* shall be set to MSG_BAND and the integer pointed to by *bandp* shall be set to the priority band of the message.

If O_NONBLOCK is not set, *getmsg*( ) and *getpmsg*( ) shall block until a message of the type specified by *flagsp* is available at the front of the STREAM head read queue. If O_NONBLOCK is set and a message of the specified type is not present at the front of the read queue, *getmsg*( ) and *getpmsg*( ) shall fail and set *errno* to [EAGAIN].

If a hangup occurs on the STREAM from which messages are retrieved, *getmsg*( ) and *getpmsg*( ) shall continue to operate normally, as described above, until the STREAM head read queue is empty. Thereafter, they shall return 0 in the *len* members of *ctlptr* and *dataptr*.

RETURN VALUE

Upon successful completion, *getmsg*( ) and *getpmsg*( ) shall return a non-negative value. A value of 0 indicates that a full message was read successfully. A return value of MORECTL indicates that more control information is waiting for retrieval. A return value of MOREDATA indicates that more data is waiting for retrieval. A return value of the bitwise-logical OR of MORECTL and MOREDATA indicates that both types of information remain. Subsequent *getmsg*( ) and *getpmsg*( ) calls shall retrieve the remainder of the message. However, if a message of higher priority has come in on the STREAM head read queue, the next call to *getmsg*( ) or *getpmsg*( ) shall retrieve that higher-priority message before retrieving the remainder of the previous message.

If the high priority control part of the message is consumed, the message shall be placed back on the queue as a normal message of band 0. Subsequent *getmsg*( ) and *getpmsg*( ) calls shall retrieve the remainder of the message. If, however, a priority message arrives or already exists on the STREAM head, the subsequent call to *getmsg*( ) or *getpmsg*( ) shall retrieve the higher-priority message before retrieving the remainder of the message that was put back.

Upon failure, *getmsg*( ) and *getpmsg*( ) shall return –1 and set *errno* to indicate the error.

ERRORS

The *getmsg*( ) and *getpmsg*( ) functions shall fail if:

[EAGAIN] The O_NONBLOCK flag is set and no messages are available.

[EBADF] The *fildes* argument is not a valid file descriptor open for reading.

[EBADMSG] The queued message to be read is not valid for *getmsg*( ) or *getpmsg*( ) or a pending file descriptor is at the STREAM head.

[EINTR] A signal was caught during *getmsg*( ) or *getpmsg*( ).

[EINVAL] An illegal value was specified by *flagsp*, or the STREAM or multiplexer referenced by *fildes* is linked (directly or indirectly) downstream from a multiplexer.

35890 [ENOSTR] A STREAM is not associated with *fildes*.

35891 In addition, *getmsg*( ) and *getpmsg*( ) shall fail if the STREAM head had processed an
35892 asynchronous error before the call. In this case, the value of *errno* does not reflect the result of
35893 *getmsg*( ) or *getpmsg*( ) but reflects the prior error.

35894 **EXAMPLES**

35895 **Getting Any Message**

35896 In the following example, the value of *fd* is assumed to refer to an open STREAMS file. The call
35897 to *getmsg*( ) retrieves any available message on the associated STREAM-head read queue,
35898 returning control and data information to the buffers pointed to by *ctrlbuf* and *databuf*,
35899 respectively.

```
35900 #include <stropts.h>
35901 ...
35902 int fd;
35903 char ctrlbuf[128];
35904 char databuf[512];
35905 struct strbuf ctrl;
35906 struct strbuf data;
35907 int flags = 0;
35908 int ret;

35909 ctrl.buf = ctrlbuf;
35910 ctrl.maxlen = sizeof(ctrlbuf);

35911 data.buf = databuf;
35912 data.maxlen = sizeof(databuf);

35913 ret = getmsg (fd, &ctrl, &data, &flags);
```

35914 **Getting the First Message off the Queue**

35915 In the following example, the call to *getpmsg*( ) retrieves the first available message on the
35916 associated STREAM-head read queue.

```
35917 #include <stropts.h>
35918 ...

35919 int fd;
35920 char ctrlbuf[128];
35921 char databuf[512];
35922 struct strbuf ctrl;
35923 struct strbuf data;
35924 int band = 0;
35925 int flags = MSG_ANY;
35926 int ret;

35927 ctrl.buf = ctrlbuf;
35928 ctrl.maxlen = sizeof(ctrlbuf);

35929 data.buf = databuf;
35930 data.maxlen = sizeof(databuf);

35931 ret = getpmsg (fd, &ctrl, &data, &band, &flags);
```

35932 **APPLICATION USAGE**

35933 None.

35934 **RATIONALE**

35935 None.

35936 **FUTURE DIRECTIONS**

35937 The *getmsg*( ) and *getpmsg*( ) functions may be removed in a future version.

35941 **CHANGE HISTORY**

35942 First released in Issue 4, Version 2.

35943 **Issue 5**

35944 Moved from X/OPEN UNIX extension to BASE.

35945 A paragraph regarding ``high-priority control parts of messages'' is added to the RETURN
35946 VALUE section.

35947 **Issue 6**

35948 This function is marked as part of the XSI STREAMS Option Group.

35949 The **restrict** keyword is added to the *getmsg*( ) and *getpmsg*( ) prototypes for alignment with the
35950 ISO/IEC 9899: 1999 standard.

35951 **Issue 7**

35952 The *getmsg*( ) and *getpmsg*( ) functions are marked obsolescent.

35953 **NAME**

35954 getnameinfo ‡'get name information

35955 **SYNOPSIS**

35956 #include <sys/socket.h>
35957 #include <netdb.h>

35958 int getnameinfo(const struct sockaddr *restrict *sa*, socklen_t *salen*,
35959 char *restrict *node*, socklen_t *nodelen*, char *restrict *service*,
35960 socklen_t *servicelen*, int *flags*);

35961 **DESCRIPTION**

35962 The *getnameinfo*( ) function shall translate a socket address to a node name and service location,
35963 all of which are defined as in *freeaddrinfo*( ).

35964 The *sa* argument points to a socket address structure to be translated. The *salen* argument
35965 contains the length of the address pointed to by *sa*.

35966 IP6 If the socket address structure contains an IPv4-mapped IPv6 address or an IPv4-compatible
35967 IPv6 address, the implementation shall extract the embedded IPv4 address and lookup the node
35968 name for that IPv4 address.

35969 If the address is the IPv6 unspecified address ("::"), a lookup shall not be performed and the
35970 behavior shall be the same as when the node's name cannot be located.

35971 If the *node* argument is non-NULL and the *nodelen* argument is non-zero, then the *node* argument
35972 points to a buffer able to contain up to *nodelen* bytes that receives the node name as a null-
35973 terminated string. If the *node* argument is NULL or the *nodelen* argument is zero, the node name
35974 shall not be returned. If the node's name cannot be located, the numeric form of the address
35975 contained in the socket address structure pointed to by the *sa* argument is returned instead of its
35976 name.

35977 If the *service* argument is non-NULL and the *servicelen* argument is non-zero, then the *service*
35978 argument points to a buffer able to contain up to *servicelen* bytes that receives the service name
35979 as a null-terminated string. If the *service* argument is NULL or the *servicelen* argument is zero,
35980 the service name shall not be returned. If the service's name cannot be located, the numeric form
35981 of the service address (for example, its port number) shall be returned instead of its name.

35982 The *flags* argument is a flag that changes the default actions of the function. By default the fully-
35983 qualified domain name (FQDN) for the host shall be returned, but:

35984 If the flag bit NI_NOFQDN is set, only the node name portion of the FQDN shall be
35985 returned for local hosts.

35986 If the flag bit NI_NUMERICHOST is set, the numeric form of the address contained in the
35987 socket address structure pointed to by the *sa* argument shall be returned instead of its
35988 name.

35989 If the flag bit NI_NAMEREQD is set, an error shall be returned if the host's name cannot
35990 be located.

35991 If the flag bit NI_NUMERICSERV is set, the numeric form of the service address shall be
35992 returned (for example, its port number) instead of its name.

35993 If the flag bit NI_NUMERICSCOPE is set, the numeric form of the scope identifier shall be
35994 returned (for example, interface index) instead of its name. This flag shall be ignored if the
35995 *sa* argument is not an IPv6 address.

35996 If the flag bit NI_DGRAM is set, this indicates that the service is a datagram service
35997 (SOCK_DGRAM). The default behavior shall assume that the service is a stream service
35998 (SOCK_STREAM).

35999 **Notes:**

36000 1. The two NI_NUMERICxxx flags are required to support the –**n** flag that many
36001 commands provide.

36002 2. The NI_DGRAM flag is required for the few AF_INET and AF_INET6 port numbers (for
36003 example, [512,514]) that represent different services for UDP and TCP.

36004 The *getnameinfo*( ) function shall be thread-safe.

36005 **RETURN VALUE**

36006 A zero return value for *getnameinfo*( ) indicates successful completion; a non-zero return value
36007 indicates failure. The possible values for the failures are listed in the ERRORS section.

36008 Upon successful completion, *getnameinfo*( ) shall return the *node* and *service* names, if requested,
36009 in the buffers provided. The returned names are always null-terminated strings.

36010 **ERRORS**

36011 The *getnameinfo*( ) function shall fail and return the corresponding value if:

36012 [EAI_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

36013 [EAI_BADFLAGS]
36014 The *flags* had an invalid value.

36015 [EAI_FAIL] A non-recoverable error occurred.

36016 [EAI_FAMILY] The address family was not recognized or the address length was invalid for
36017 the specified family.

36018 [EAI_MEMORY] There was a memory allocation failure.

36019 [EAI_NONAME] The name does not resolve for the supplied parameters.

36020 NI_NAMEREQD is set and the host's name cannot be located, or both
36021 *nodename* and *servname* were null.

36022 [EAI_OVERFLOW]
36023 An argument buffer overflowed. The buffer pointed to by the *node* argument
36024 or the *service* argument was too small.

36025 [EAI_SYSTEM] A system error occurred. The error code can be found in *errno*.

36026 **EXAMPLES**

36027 None.

36028 **APPLICATION USAGE**

36029 If the returned values are to be used as part of any further name resolution (for example, passed
36030 to *getaddrinfo*( )), applications should provide buffers large enough to store any result possible on
36031 the system.

36032 Given the IPv4-mapped IPv6 address `"::ffff:1.2.3.4"`, the implementation performs a
36033 lookup as if the socket address structure contains the IPv4 address `"1.2.3.4"`.

36034 The IPv6 unspecified address (`"::"`) and the IPv6 loopback address (`"::1"`) are not
36035 IPv4-compatible addresses.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getnameinfo*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/23 is applied, making various changes in the SYNOPSIS and DESCRIPTION for alignment with IPv6.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/24 is applied, adding the [EAI_OVERFLOW] error to the ERRORS section.

Issue 7

SD5-XSH-ERN-127 is applied, clarifying the behavior if the address is the IPv6 unspecified address.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0246 [284] and XSH/TC1-2008/0247 [285] are applied.

36056 **NAME**

36057 getnetbyaddr, getnetbyname, getnetent ‡'network database functions

36058 **SYNOPSIS**

36059 `#include <netdb.h>`

36060 `struct netent *getnetbyaddr(uint32_t net, int type);`
36061 `struct netent *getnetbyname(const char *name);`
36062 `struct netent *getnetent(void);`

36063 **DESCRIPTION**

36064 Refer to *endnetent( )*.

NAME

getopt, optarg, opterr, optind, optopt ‡'command option parsing

SYNOPSIS

```
#include <unistd.h>

int getopt(int argc, char * const argv[], const char *optstring);
extern char *optarg;
extern int opterr, optind, optopt;
```

DESCRIPTION

The *getopt*( ) function is a command-line parser that shall follow Utility Syntax Guidelines 3, 4, 5, 6, 7, 9, and 10 in XBD Section 12.2 (on page 216).

The parameters *argc* and *argv* are the argument count and argument array as passed to *main*( ) (see *exec*( )). The argument *optstring* is a string of recognized option characters; if a character is followed by a <colon>, the option takes an argument. All option characters allowed by Utility Syntax Guideline 3 are allowed in *optstring*. The implementation may accept other characters as an extension.

The variable *optind* is the index of the next element of the *argv*[ ] vector to be processed. It shall be initialized to 1 by the system, and *getopt*( ) shall update it when it finishes with each element of *argv*[ ]. If the application sets *optind* to zero before calling *getopt*( ), the behavior is unspecified. When an element of *argv*[ ] contains multiple option characters, it is unspecified how *getopt*( ) determines which options have already been processed.

The *getopt*( ) function shall return the next option character (if one is found) from *argv* that matches a character in *optstring*, if there is one that matches. If the option takes an argument, *getopt*( ) shall set the variable *optarg* to point to the option-argument as follows:

1. If the option was the last character in the string pointed to by an element of *argv*, then *optarg* shall contain the next element of *argv*, and *optind* shall be incremented by 2. If the resulting value of *optind* is greater than *argc*, this indicates a missing option-argument, and *getopt*( ) shall return an error indication.
2. Otherwise, *optarg* shall point to the string following the option character in that element of *argv*, and *optind* shall be incremented by 1.

If, when *getopt*( ) is called:

argv[optind]	is a null pointer
**argv*[optind]	is not the character –
argv[optind]	points to the string "–"

getopt( ) shall return –1 without changing *optind*. If:

argv[optind]	points to the string "––"

getopt( ) shall return –1 after incrementing *optind*.

If *getopt*( ) encounters an option character that is not contained in *optstring*, it shall return the <question-mark> ('?') character. If it detects a missing option-argument, it shall return the <colon> character (':') if the first character of *optstring* was a <colon>, or a <question-mark> character ('?') otherwise. In either case, *getopt*( ) shall set the variable *optopt* to the option character that caused the error. If the application has not set the variable *opterr* to 0 and the first character of *optstring* is not a <colon>, *getopt*( ) shall also print a diagnostic message to *stderr* in the format specified for the *getopts* utility, unless the *stderr* stream has wide orientation, in which case the behavior is undefined.

The *getopt*( ) function need not be thread-safe.

RETURN VALUE

The *getopt*( ) function shall return the next option character specified on the command line.

A <colon> (':') shall be returned if *getopt*( ) detects a missing argument and the first character of *optstring* was a <colon> (':').

A <question-mark> ('?') shall be returned if *getopt*( ) encounters an option character not in *optstring* or detects a missing argument and the first character of *optstring* was not a <colon> (':').

Otherwise, *getopt*( ) shall return –1 when all command line options are parsed.

ERRORS

If the application has not set the variable *opterr* to 0, the first character of *optstring* is not a <colon>, and a write error occurs while *getopt*( ) is printing a diagnostic message to *stderr*, then the error indicator for *stderr* shall be set; but *getopt*( ) shall still succeed and the value of *errno* after *getopt*( ) is unspecified.

EXAMPLES

Parsing Command Line Options

The following code fragment shows how you might process the arguments for a utility that can take the mutually-exclusive options *a* and *b* and the options *f* and *o*, both of which require arguments:

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>

int
main(int argc, char *argv[ ])
{
    int c;
    int bflg = 0, aflg = 0, errflg = 0;
    char *ifile;
    char *ofile;
    . . .
    while ((c = getopt(argc, argv, ":abf:o:")) != -1) {
        switch(c) {
        case 'a':
            if (bflg)
                errflg++;
            else
                aflg++;
            break;
        case 'b':
            if (aflg)
                errflg++;
            else
                bflg++;
            break;
        case 'f':
            ifile = optarg;
            break;
        case 'o':
```

```
                ofile = optarg;
                break;
            case ':':       /* -f or -o without operand */
                fprintf(stderr,
                    "Option -%c requires an operand\n", optopt);
                errflg++;
                break;
            case '?':
                fprintf(stderr,
                    "Unrecognized option: '-%c'\n", optopt);
                errflg++;
            }
        }
        if (errflg) {
            fprintf(stderr, "usage: . . . ");
            exit(2);
        }
        for ( ; optind < argc; optind++) {
            if (access(argv[optind], R_OK)) {
        . . .
    }
```

This code accepts any of the following as equivalent:

```
cmd -ao arg path path
cmd -a -o arg path path
cmd -o arg -a path path
cmd -a -o arg -- path path
cmd -a -oarg path path
cmd -aoarg path path
```

Selecting Options from the Command Line

The following example selects the type of database routines the user wants to use based on the *Options* argument.

```
#include <unistd.h>
#include <string.h>
...
const char *Options = "hdbtl";
...
int dbtype, c;
char *st;
...
dbtype = 0;
while ((c = getopt(argc, argv, Options)) != -1) {
    if ((st = strchr(Options, c)) != NULL) {
        dbtype = st - Options;
        break;
    }
}
```

APPLICATION USAGE

The *getopt*( ) function is only required to support option characters included in Utility Syntax Guideline 3. Many historical implementations of *getopt*( ) support other characters as options. This is an allowed extension, but applications that use extensions are not maximally portable. Note that support for multi-byte option characters is only possible when such characters can be represented as type **int**.

Applications which use wide-character output functions with *stderr* should ensure that any calls to *getopt*( ) do not write to *stderr*, either by setting *opterr* to 0 or by ensuring the first character of *optstring* is always a <colon>.

While *ferror*(*stderr*) may be used to detect failures to write a diagnostic to *stderr* when *getopt*( ) returns `'?'`, the value of *errno* is unspecified in such a condition. Applications desiring more control over handling write failures should set *opterr* to 0 and independently perform output to *stderr*, rather than relying on *getopt*( ) to do the output.

RATIONALE

The *optopt* variable represents historical practice and allows the application to obtain the identity of the invalid option.

The description has been written to make it clear that *getopt*( ), like the *getopts* utility, deals with option-arguments whether separated from the option by <blank> characters or not. Note that the requirements on *getopt*( ) and *getopts* are more stringent than the Utility Syntax Guidelines.

The *getopt*( ) function shall return –1, rather than EOF, so that **<stdio.h>** is not required.

The special significance of a <colon> as the first character of *optstring* makes *getopt*( ) consistent with the *getopts* utility. It allows an application to make a distinction between a missing argument and an incorrect option letter without having to examine the option letter. It is true that a missing argument can only be detected in one case, but that is a case that has to be considered.

FUTURE DIRECTIONS

None.

Austin Group Interpretation 1003.1-2001 #156 is applied.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0248 [318], XSH/TC1-2008/0249 [460], XSH/TC1-2008/0250 [189], XSH/TC1-2008/0251 [189], XSH/TC1-2008/0252 [189], and XSH/TC1-2008/0253 [460] are applied.

36245 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0169 [608] is applied.

36246 **NAME**

36247 getpeername ‡'get the name of the peer socket

36248 **SYNOPSIS**

36249 ```
#include <sys/socket.h>
```

36250 ```
int getpeername(int socket, struct sockaddr *restrict address,
```

36251 ```
    socklen_t *restrict address_len);
```

36252 **DESCRIPTION**

36253 The *getpeername*( ) function shall retrieve the peer address of the specified socket, store this
36254 address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this
36255 address in the object pointed to by the *address_len* argument.

36256 The *address_len* argument points to a **socklen_t** object which on input specifies the length of the
36257 supplied **sockaddr** structure, and on output specifies the length of the stored address. If the
36258 actual length of the address is greater than the length of the supplied **sockaddr** structure, the
36259 stored address shall be truncated.

36260 If the protocol permits connections by unbound clients, and the peer is not bound, then the
36261 value stored in the object pointed to by *address* is unspecified.

36262 **RETURN VALUE**

36263 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
36264 indicate the error.

36265 **ERRORS**

36266 The *getpeername*( ) function shall fail if:

36267 [EBADF] The *socket* argument is not a valid file descriptor.

36268 [EINVAL] The socket has been shut down.

36269 [ENOTCONN] The socket is not connected or otherwise has not had the peer pre-specified.

36270 [ENOTSOCK] The *socket* argument does not refer to a socket.

36271 [EOPNOTSUPP] The operation is not supported for the socket protocol.

36272 The *getpeername*( ) function may fail if:

36273 [ENOBUFS] Insufficient resources were available in the system to complete the call.

36274 **EXAMPLES**

36275 None.

36276 **APPLICATION USAGE**

36277 None.

36278 **RATIONALE**

36279 None.

36280 **FUTURE DIRECTIONS**

36284 XBD **<sys/socket.h>**

  
```

36285 **CHANGE HISTORY**

36286 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

36287 The **restrict** keyword is added to the *getpeername*( ) prototype for alignment with the
36288 ISO/IEC 9899: 1999 standard.

36289 **Issue 7**

36290 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0254 [464] is applied.

NAME

getpgid — get the process group ID for a process

SYNOPSIS

```
#include <unistd.h>

pid_t getpgid(pid_t pid);
```

DESCRIPTION

The *getpgid*( ) function shall return the process group ID of the process whose process ID is equal to *pid*. If *pid* is equal to 0, *getpgid*( ) shall return the process group ID of the calling process.

RETURN VALUE

Upon successful completion, *getpgid*( ) shall return a process group ID. Otherwise, it shall return (**pid_t**)–1 and set *errno* to indicate the error.

ERRORS

The *getpgid*( ) function shall fail if:

[EPERM] The process whose process ID is equal to *pid* is not in the same session as the calling process, and the implementation does not allow access to the process group ID of that process from the calling process.

[ESRCH] There is no process with a process ID equal to *pid*.

The *getpgid*( ) function may fail if:

[EINVAL] The value of the *pid* argument is invalid.

XBD **<unistd.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 7

The *getpgid*( ) function is moved from the XSI option to the Base.

NAME

getpgrp — get the process group ID of the calling process

SYNOPSIS

```
#include <unistd.h>

pid_t getpgrp(void);
```

DESCRIPTION

The *getpgrp*( ) function shall return the process group ID of the calling process.

RETURN VALUE

The *getpgrp*( ) function shall always be successful and no return value is reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

4.3 BSD provides a *getpgrp*( ) function that returns the process group ID for a specified process. Although this function supports job control, all known job control shells always specify the calling process with this function. Thus, the simpler System V *getpgrp*( ) suffices, and the added complexity of the 4.3 BSD *getpgrp*( ) is provided by the XSI extension *getpgid*( ).

FUTURE DIRECTIONS

None.

NAME

getpriority, setpriority ‡'get and set the nice value

SYNOPSIS

XSI
```
#include <sys/resource.h>

int getpriority(int which, id_t who);
int setpriority(int which, id_t who, int value);
```

DESCRIPTION

The *getpriority*( ) function shall obtain the nice value of a process, process group, or user. The *setpriority*( ) function shall set the nice value of a process, process group, or user to *value*+{NZERO}.

Target processes are specified by the values of the *which* and *who* arguments. The *which* argument may be one of the following values: PRIO_PROCESS, PRIO_PGRP, or PRIO_USER, indicating that the *who* argument is to be interpreted as a process ID, a process group ID, or an effective user ID, respectively. A 0 value for the *who* argument specifies the current process, process group, or user.

The nice value set with *setpriority*( ) shall be applied to the process. If the process is multi-threaded, the nice value shall affect all system scope threads in the process.

If more than one process is specified, *getpriority*( ) shall return value {NZERO} less than the lowest nice value pertaining to any of the specified processes, and *setpriority*( ) shall set the nice values of all of the specified processes to *value*+{NZERO}.

The default nice value is {NZERO}; lower nice values shall cause more favorable scheduling. While the range of valid nice values is [0,{NZERO}*2–1], implementations may enforce more restrictive limits. If *value*+{NZERO} is less than the system's lowest supported nice value, *setpriority*( ) shall set the nice value to the lowest supported value; if *value*+{NZERO} is greater than the system's highest supported nice value, *setpriority*( ) shall set the nice value to the highest supported value.

Only a process with appropriate privileges can lower its nice value.

PS | TPS Any processes or threads using SCHED_FIFO or SCHED_RR shall be unaffected by a call to *setpriority*( ). This is not considered an error. A process which subsequently reverts to SCHED_OTHER need not have its priority affected by such a *setpriority*( ) call.

The effect of changing the nice value may vary depending on the process-scheduling algorithm in effect.

Since *getpriority*( ) can return the value –1 upon successful completion, it is necessary to set *errno* to 0 prior to a call to *getpriority*( ). If *getpriority*( ) returns the value –1, then *errno* can be checked to see if an error occurred or if the value is a legitimate nice value.

RETURN VALUE

Upon successful completion, *getpriority*( ) shall return an integer in the range –{NZERO} to {NZERO}–1. Otherwise, –1 shall be returned and *errno* set to indicate the error.

Upon successful completion, *setpriority*( ) shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getpriority*( ) and *setpriority*( ) functions shall fail if:

[ESRCH] No process could be located using the *which* and *who* argument values specified.

[EINVAL] The value of the *which* argument was not recognized, or the value of the *who* argument is not a valid process ID, process group ID, or user ID.

In addition, *setpriority*( ) may fail if:

[EPERM] A process was located, but neither the real nor effective user ID of the executing process match the effective user ID of the process whose nice value is being changed.

[EACCES] A request was made to change the nice value to a lower numeric value and the current process does not have appropriate privileges.

EXAMPLES

Using getpriority( )

The following example returns the current scheduling priority for the process ID returned by the call to *getpid*( ).

```
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int ret;

pid = getpid();
ret = getpriority(which, pid);
```

Using setpriority( )

The following example sets the priority for the current process ID to –20.

```
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int priority = -20;
int ret;

pid = getpid();
ret = setpriority(which, pid, priority);
```

APPLICATION USAGE

The *getpriority*( ) and *setpriority*( ) functions work with an offset nice value (nice value –{NZERO}). The nice value is in the range [0,2*{NZERO} –1], while the return value for *getpriority*( ) and the third parameter for *setpriority*( ) are in the range [–{NZERO},{NZERO} –1].

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

nice( ), *sched_get_priority_max*( ), *sched_setscheduler*( )

XBD **<sys/resource.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The DESCRIPTION is reworded in terms of the nice value rather than *priority* to avoid confusion with functionality in the POSIX Realtime Extension.

36525 **NAME**

36526 getprotobyname, getprotobynumber, getprotent — network protocol database functions

36527 **SYNOPSIS**

36528 ```
#include <netdb.h>
```

36529 ```
struct protoent *getprotobyname(const char *name);
```
36530 ```
struct protoent *getprotobynumber(int proto);
```
36531 ```
struct protoent *getprotoent(void);
```

36532 **DESCRIPTION**

36533 Refer to *endprotoent( )*.

NAME

getpwent ‡'get user database entry

SYNOPSIS

XSI

```
#include <pwd.h>

struct passwd *getpwent(void);
```

DESCRIPTION

Refer to *endpwent( )*.

36541 **NAME**

36542 getpwnam, getpwnam_r — search user database for a name

36543 **SYNOPSIS**

36544 ```
#include <pwd.h>

struct passwd *getpwnam(const char *name);
int getpwnam_r(const char *name, struct passwd *pwd, char *buffer,
    size_t bufsize, struct passwd **result);
```

36548 **DESCRIPTION**

36549 The *getpwnam*( ) function shall search the user database for an entry with a matching *name*.

36550 The *getpwnam*( ) function need not be thread-safe.

36551 Applications wishing to check for error situations should set *errno* to 0 before calling
36552 *getpwnam*( ). If *getpwnam*( ) returns a null pointer and *errno* is non-zero, an error occurred.

36553 The *getpwnam_r*( ) function shall update the **passwd** structure pointed to by *pwd* and store a
36554 pointer to that structure at the location pointed to by *result*. The structure shall contain an entry
36555 from the user database with a matching *name*. Storage referenced by the structure is allocated
36556 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to
36557 *sysconf*(_SC_GETPW_R_SIZE_MAX) returns either –1 without changing *errno* or an initial value
36558 suggested for the size of this buffer. A null pointer shall be returned at the location pointed to
36559 by *result* on error or if the requested entry is not found.

36560 **RETURN VALUE**

36561 The *getpwnam*( ) function shall return a pointer to a **struct passwd** with the structure as defined
36562 in **<pwd.h>** with a matching entry if found. A null pointer shall be returned if the requested
36563 entry is not found, or an error occurs. If the requested entry was not found, *errno* shall not be
36564 changed. On error, *errno* shall be set to indicate the error.

36565 The application shall not modify the structure to which the return value points, nor any storage
36566 areas pointed to by pointers within the structure. The returned pointer, and pointers within the
36567 structure, might be invalidated or the structure or the storage areas might be overwritten by a
36568 subsequent call to *getpwent*( ), *getpwnam*( ), or *getpwuid*( ). The returned pointer, and pointers
36569 within the structure, might also be invalidated if the calling thread is terminated.

36570 The *getpwnam_r*( ) function shall return zero on success or if the requested entry was not found
36571 and no error has occurred. If an error has occurred, an error number shall be returned to indicate
36572 the error.

36573 **ERRORS**

36574 These functions may fail if:

36575 [EIO] An I/O error has occurred.

36576 [EINTR] A signal was caught during *getpwnam*( ).

36577 [EMFILE] All file descriptors available to the process are currently open.

36578 [ENFILE] The maximum allowable number of files is currently open in the system.

36579 The *getpwnam_r*( ) function may fail if:

36580 [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be
36581 referenced by the resulting **passwd** structure.

  
```

EXAMPLES

Note that *sysconf* (_SC_GETPW_R_SIZE_MAX) may return –1 if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with *getpwnam_r*( ).

```
long int initlen = sysconf(_SC_GETPW_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct passwd result;
struct passwd *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getpwnam_r("someuser", &result, buffer, len, &resultp))
        == ERANGE)
    {
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
    }
if (e != 0)
    ...handle error...
free (buffer);
```

Getting an Entry for the Login Name

The following example uses the *getlogin*( ) function to return the name of the user who logged in; this information is passed to the *getpwnam*( ) function to get the user database entry for that user.

```
#include <sys/types.h>
#include <pwd.h>
#include <unistd.h>
#include <stdio.h>
#include <stdlib.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
}
...
```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid*(*geteuid*( )) returns the name associated with the effective user ID of the process; *getlogin*( ) returns the name associated with the current login activity; and *getpwuid*(*getuid*( )) returns the name associated with the real user ID of the process.

The *getpwnam_r*( ) function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return –1 from *sysconf*( ) indicating that there is no maximum for _SC_GETPW_R_SIZE_MAX.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

getpwuid( ), *sysconf*( )

XBD **<pwd.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getpwnam_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getpwnam*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getpwnam_r*( ) function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the *name*.

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-166 is applied.

The *getpwnam_r*( ) function is moved from the Thread-Safe Functions option to the Base.

A minor addition is made to the EXAMPLES section, reminding the application developer to free memory allocated as if by *malloc*( ).

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0255 [75,428] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0170 [808] and XSH/TC2-2008/0171 [656] are applied.

36681 **NAME**

36682 getpwuid, getpwuid_r — search user database for a user ID

36683 **SYNOPSIS**

36684
```
#include <pwd.h>
```

36685
```
struct passwd *getpwuid(uid_t uid);
```
36686
```
int getpwuid_r(uid_t uid, struct passwd *pwd, char *buffer,
```
36687
```
    size_t bufsize, struct passwd **result);
```

36688 **DESCRIPTION**

36689 The *getpwuid*( ) function shall search the user database for an entry with a matching *uid*.

36690 The *getpwuid*( ) function need not be thread-safe.

36691 Applications wishing to check for error situations should set *errno* to 0 before calling *getpwuid*( ).
36692 If *getpwuid*( ) returns a null pointer and *errno* is set to non-zero, an error occurred.

36693 The *getpwuid_r*( ) function shall update the **passwd** structure pointed to by *pwd* and store a
36694 pointer to that structure at the location pointed to by *result*. The structure shall contain an entry
36695 from the user database with a matching *uid*. Storage referenced by the structure is allocated
36696 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to
36697 *sysconf*(_SC_GETPW_R_SIZE_MAX) returns either –1 without changing *errno* or an initial value
36698 suggested for the size of this buffer. A null pointer shall be returned at the location pointed to
36699 by *result* on error or if the requested entry is not found.

36700 **RETURN VALUE**

36701 The *getpwuid*( ) function shall return a pointer to a **struct passwd** with the structure as defined in
36702 **<pwd.h>** with a matching entry if found. A null pointer shall be returned if the requested entry
36703 is not found, or an error occurs. If the requested entry was not found, *errno* shall not be changed.
36704 On error, *errno* shall be set to indicate the error.

36705 The application shall not modify the structure to which the return value points, nor any storage
36706 areas pointed to by pointers within the structure. The returned pointer, and pointers within the
36707 structure, might be invalidated or the structure or the storage areas might be overwritten by a
36708 subsequent call to *getpwent*( ), *getpwnam*( ), or *getpwuid*( ). The returned pointer, and pointers
36709 within the structure, might also be invalidated if the calling thread is terminated.

36710 If successful, the *getpwuid_r*( ) function shall return zero; otherwise, an error number shall be
36711 returned to indicate the error.

36712 **ERRORS**

36713 These functions may fail if:

36714 [EIO] An I/O error has occurred.

36715 [EINTR] A signal was caught during *getpwuid*( ).

36716 [EMFILE] All file descriptors available to the process are currently open.

36717 [ENFILE] The maximum allowable number of files is currently open in the system.

36718 The *getpwuid_r*( ) function may fail if:

36719 [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be
36720 referenced by the resulting **passwd** structure.

EXAMPLES

Note that *sysconf* (_SC_GETPW_R_SIZE_MAX) may return –1 if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with *getpwuid_r*( ).

```
long int initlen = sysconf(_SC_GETPW_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct passwd result;
struct passwd *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getpwuid_r(42, &result, buffer, len, &resultp)) == ERANGE)
    {
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
    }
if (e != 0)
    ...handle error...
free (buffer);
```

Getting an Entry for the Root User

The following example gets the user database entry for the user with user ID 0 (root).

```
#include <sys/types.h>
#include <pwd.h>
...
uid_t id = 0;
struct passwd *pwd;

pwd = getpwuid(id);
```

Finding the Name for the Effective User ID

The following example defines *pws* as a pointer to a structure of type **passwd**, which is used to store the structure pointer returned by the call to the *getpwuid*( ) function. The *geteuid*( ) function shall return the effective user ID of the calling process; this is used as the search criteria for the *getpwuid*( ) function. The call to *getpwuid*( ) shall return a pointer to the structure containing that user ID value.

```
#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
...
struct passwd *pws;
pws = getpwuid(geteuid());
```

Finding an Entry in the User Database

The following example uses *getpwuid*( ) to search the user database for a user ID that was previously stored in a **stat** structure, then prints out the user name if it is found. If the user is not found, the program prints the numeric value of the user ID for the entry.

```
#include <sys/types.h>
#include <pwd.h>
#include <stdio.h>
...
struct stat statbuf;
struct passwd *pwd;
...
if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
    printf(" %-8.8s", pwd->pw_name);
else
    printf(" %-8d", statbuf.st_uid);
```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid*(*geteuid*( )) returns the name associated with the effective user ID of the process; *getlogin*( ) returns the name associated with the current login activity; and *getpwuid*(*getuid*( )) returns the name associated with the real user ID of the process.

The *getpwuid_r*( ) function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return –1 from *sysconf*( ) indicating that there is no maximum for _SC_GETPW_R_SIZE_MAX.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

getpwnam( ), *geteuid*( ), *getuid*( ), *getlogin*( ), *sysconf*( )

XBD **<pwd.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getpwuid_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getpwuid*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getpwuid_r*( ) function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the *uid*.

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-166 is applied.

The *getpwuid_r*( ) function is moved from the Thread-Safe Functions option to the Base.

A minor addition is made to the EXAMPLES section, reminding the application developer to free memory allocated as if by *malloc*( ).

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0256 [75] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0172 [808] and XSH/TC2-2008/0173 [656] are applied.

NAME

getrlimit, setrlimit — control maximum resource consumption

SYNOPSIS

XSI
```
#include <sys/resource.h>

int getrlimit(int resource, struct rlimit *rlp);
int setrlimit(int resource, const struct rlimit *rlp);
```

DESCRIPTION

The *getrlimit*( ) function shall get, and the *setrlimit*( ) function shall set, limits on the consumption of a variety of resources.

Each call to either *getrlimit*( ) or *setrlimit*( ) identifies a specific resource to be operated upon as well as a resource limit. A resource limit is represented by an **rlimit** structure. The *rlim_cur* member specifies the current or soft limit and the *rlim_max* member specifies the maximum or hard limit. Soft limits may be changed by a process to any value that is less than or equal to the hard limit. A process may (irreversibly) lower its hard limit to any value that is greater than or equal to the soft limit. Only a process with appropriate privileges can raise a hard limit. Both hard and soft limits can be changed in a single call to *setrlimit*( ) subject to the constraints described above.

The value RLIM_INFINITY, defined in **<sys/resource.h>**, shall be considered to be larger than any other limit value. If a call to *getrlimit*( ) returns RLIM_INFINITY for a resource, it means the implementation shall not enforce limits on that resource. Specifying RLIM_INFINITY as any resource limit value on a successful call to *setrlimit*( ) shall inhibit enforcement of that resource limit.

The following resources are defined:

RLIMIT_CORE
: This is the maximum size of a **core** file, in bytes, that may be created by a process. A limit of 0 shall prevent the creation of a **core** file. If this limit is exceeded, the writing of a **core** file shall terminate at this size.

RLIMIT_CPU
: This is the maximum amount of CPU time, in seconds, used by a process. If this limit is exceeded, SIGXCPU shall be generated for the process. If the process is catching or ignoring SIGXCPU, or all threads belonging to that process are blocking SIGXCPU, the behavior is unspecified.

RLIMIT_DATA
: This is the maximum size of a data segment of the process, in bytes. If this limit is exceeded, the *malloc*( ) function shall fail with *errno* set to [ENOMEM].

RLIMIT_FSIZE
: This is the maximum size of a file, in bytes, that may be created by a process. If a write or truncate operation would cause this limit to be exceeded, SIGXFSZ shall be generated for the thread. If the thread is blocking, or the process is catching or ignoring SIGXFSZ, continued attempts to increase the size of a file from end-of-file to beyond the limit shall fail with *errno* set to [EFBIG].

RLIMIT_NOFILE
: This is a number one greater than the maximum value that the system may assign to a newly-created descriptor. If this limit is exceeded, functions that allocate a file descriptor shall fail with *errno* set to [EMFILE]. This limit constrains the number of file descriptors that a process may allocate.

RLIMIT_STACK — This is the maximum size of the initial thread's stack, in bytes. The implementation does not automatically grow the stack beyond this limit. If this limit is exceeded, SIGSEGV shall be generated for the thread. If the thread is blocking SIGSEGV, or the process is ignoring or catching SIGSEGV and has not made arrangements to use an alternate stack, the disposition of SIGSEGV shall be set to SIG_DFL before it is generated.

RLIMIT_AS — This is the maximum size of total available memory of the process, in bytes. If this limit is exceeded, the *malloc*( ) and *mmap*( ) functions shall fail with *errno* set to [ENOMEM]. In addition, the automatic stack growth fails with the effects outlined above.

When using the *getrlimit*( ) function, if a resource limit can be represented correctly in an object of type **rlim_t**, then its representation is returned; otherwise, if the value of the resource limit is equal to that of the corresponding saved hard limit, the value returned shall be RLIM_SAVED_MAX; otherwise, the value returned shall be RLIM_SAVED_CUR.

When using the *setrlimit*( ) function, if the requested new limit is RLIM_INFINITY, the new limit shall be ``no limit''; otherwise, if the requested new limit is RLIM_SAVED_MAX, the new limit shall be the corresponding saved hard limit; otherwise, if the requested new limit is RLIM_SAVED_CUR, the new limit shall be the corresponding saved soft limit; otherwise, the new limit shall be the requested value. In addition, if the corresponding saved limit can be represented correctly in an object of type **rlim_t** then it shall be overwritten with the new limit.

The result of setting a limit to RLIM_SAVED_MAX or RLIM_SAVED_CUR is unspecified unless a previous call to *getrlimit*( ) returned that value as the soft or hard limit for the corresponding resource limit.

The determination of whether a limit can be correctly represented in an object of type **rlim_t** is implementation-defined. For example, some implementations permit a limit whose value is greater than RLIM_INFINITY and others do not.

The *exec* family of functions shall cause resource limits to be saved.

RETURN VALUE

Upon successful completion, *getrlimit*( ) and *setrlimit*( ) shall return 0. Otherwise, these functions shall return –1 and set *errno* to indicate the error.

ERRORS

The *getrlimit*( ) and *setrlimit*( ) functions shall fail if:

[EINVAL] — An invalid *resource* was specified; or in a *setrlimit*( ) call, the new *rlim_cur* exceeds the new *rlim_max*.

[EPERM] — The limit specified to *setrlimit*( ) would have raised the maximum limit value, and the calling process does not have appropriate privileges.

The *setrlimit*( ) function may fail if:

[EINVAL] — The limit specified cannot be lowered because current usage is already higher than the limit.

EXAMPLES

None.

APPLICATION USAGE

If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the value of {_POSIX_OPEN_MAX} from **<limits.h>**, unexpected behavior may occur.

If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the highest currently open file descriptor +1, unexpected behavior may occur.

RATIONALE

It should be noted that RLIMIT_STACK applies ``at least'' to the stack of the initial thread in the process, and not to the sum of all the stacks in the process, as that would be very limiting unless the value is so big as to provide no value at all with a single thread.

FUTURE DIRECTIONS

None.

XBD **<stropts.h>**, **<sys/resource.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

An APPLICATION USAGE section is added.

Large File Summit extensions are added.

Issue 6

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/25 is applied, changing wording for RLIMIT_NOFILE in the DESCRIPTION related to functions that allocate a file descriptor failing with [EMFILE]. Text is added to the APPLICATION USAGE section noting the consequences of a process attempting to set the hard or soft limit for RLIMIT_NOFILE less than the highest currently open file descriptor +1.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/46 is applied, updating the definition of RLIMIT_STACK in the DESCRIPTION from ``the maximum size of a process stack'' to ``the maximum size of the initial thread's stack''. Text is added to the RATIONALE section.

NAME

getrusage — get information about resource utilization

SYNOPSIS

XSI
```
#include <sys/resource.h>

int getrusage(int who, struct rusage *r_usage);
```

DESCRIPTION

The *getrusage*( ) function shall provide measures of the resources used by the current process or its terminated and waited-for child processes. If the value of the *who* argument is RUSAGE_SELF, information shall be returned about resources used by the current process. If the value of the *who* argument is RUSAGE_CHILDREN, information shall be returned about resources used by the terminated and waited-for children of the current process. If the child is never waited for (for example, if the parent has SA_NOCLDWAIT set or sets SIGCHLD to SIG_IGN), the resource information for the child process is discarded and not included in the resource information provided by *getrusage*( ).

The *r_usage* argument is a pointer to an object of type **struct rusage** in which the returned information is stored.

RETURN VALUE

Upon successful completion, *getrusage*( ) shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getrusage*( ) function shall fail if:

[EINVAL] The value of the *who* argument is not valid.

EXAMPLES

Using getrusage( )

The following example returns information about the resources used by the current process.

```
#include <sys/resource.h>
...
int who = RUSAGE_SELF;
struct rusage usage;
int ret;

ret = getrusage(who, &usage);
```

NAME

gets — get a string from a *stdin* stream

SYNOPSIS

OB
```
#include <stdio.h>

char *gets(char *s);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *gets*( ) function shall read bytes from the standard input stream, *stdin*, into the array pointed to by *s*, until a <newline> is read or an end-of-file condition is encountered. Any <newline> shall be discarded and a null byte shall be placed immediately after the last byte read into the array.

CX The *gets*( ) function may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *getdelim*( ), *getline*( ), *gets*( ), or *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ).

RETURN VALUE

Upon successful completion, *gets*( ) shall return *s*. If the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *gets*( ) shall return a null pointer. If a read error occurs, the error indicator for the stream shall be set,
CX *gets*( ) shall return a null pointer, and set *errno* to indicate the error.

ERRORS

Refer to *fgetc*( ).

EXAMPLES

None.

APPLICATION USAGE

Reading a line that overflows the array pointed to by *s* results in undefined behavior. The use of *fgets*( ) is recommended.

Since the user cannot specify the length of the buffer passed to *gets*( ), use of this function is discouraged. The length of the string read is unlimited. It is possible to overflow this buffer in such a way as to cause applications to fail, or possible system security violations.

Applications should use the *fgets*( ) function instead of the obsolescent *gets*( ) function.

RATIONALE

The standard developers decided to mark the *gets*( ) function as obsolescent even though it is in the ISO C standard due to the possibility of buffer overflow.

FUTURE DIRECTIONS

The *gets*( ) function may be removed in a future version.

37056 **SYNOPSIS**

37057 `#include <unistd.h>`

37058 `pid_t getsid(pid_t pid);`

37059 **DESCRIPTION**

37060 The *getsid*( ) function shall obtain the process group ID of the process that is the session leader of
37061 the process specified by *pid*. If *pid* is (**pid_t**)0, it specifies the calling process.

37062 **RETURN VALUE**

37063 Upon successful completion, *getsid*( ) shall return the process group ID of the session leader of
37064 the specified process. Otherwise, it shall return –1 and set *errno* to indicate the error.

37065 **ERRORS**

37066 The *getsid*( ) function shall fail if:

37067 [EPERM] The process specified by *pid* is not in the same session as the calling process,
37068 and the implementation does not allow access to the process group ID of the
37069 session leader of that process from the calling process.

37070 [ESRCH] There is no process with a process ID equal to *pid*.

NAME

getsockname ‡'get the socket name

SYNOPSIS

```
#include <sys/socket.h>

int getsockname(int socket, struct sockaddr *restrict address,
    socklen_t *restrict address_len);
```

DESCRIPTION

The *getsockname*( ) function shall retrieve the locally-bound name of the specified socket, store this address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this address in the object pointed to by the *address_len* argument.

The *address_len* argument points to a **socklen_t** object which on input specifies the length of the supplied **sockaddr** structure, and on output specifies the length of the stored address. If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated.

If the socket has not been bound to a local name, the value stored in the object pointed to by *address* is unspecified.

RETURN VALUE

Upon successful completion, 0 shall be returned, the *address* argument shall point to the address of the socket, and the *address_len* argument shall point to the length of the address. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getsockname*( ) function shall fail if:

[EBADF] The *socket* argument is not a valid file descriptor.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EOPNOTSUPP] The operation is not supported for this socket's protocol.

The *getsockname*( ) function may fail if:

[EINVAL] The socket has been shut down.

[ENOBUFS] Insufficient resources were available in the system to complete the function.

EXAMPLES

None.

APPLICATION USAGE

accept( ), *bind*( ), *getpeername*( ), *socket*( )

XBD **<sys/socket.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getsockname*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0259 [464] is applied.

37134 **NAME**

37135 getsockopt ‡'get the socket options

37136 **SYNOPSIS**

37137
```
#include <sys/socket.h>
```

37138
```
int getsockopt(int socket, int level, int option_name,
```
37139
```
    void *restrict option_value, socklen_t *restrict option_len);
```

37140 **DESCRIPTION**

37141 The *getsockopt*( ) function manipulates options associated with a socket.

37142 The *getsockopt*( ) function shall retrieve the value for the option specified by the *option_name*
37143 argument for the socket specified by the *socket* argument. If the size of the option value is greater
37144 than *option_len*, the value stored in the object pointed to by the *option_value* argument shall be
37145 silently truncated. Otherwise, the object pointed to by the *option_len* argument shall be modified
37146 to indicate the actual length of the value.

37147 The *level* argument specifies the protocol level at which the option resides. To retrieve options at
37148 the socket level, specify the *level* argument as SOL_SOCKET. To retrieve options at other levels,
37149 supply the appropriate level identifier for the protocol controlling the option. For example, to
37150 indicate that an option is interpreted by the TCP (Transmission Control Protocol), set *level* to
37151 IPPROTO_TCP as defined in the **<netinet/in.h>** header.

37152 The socket in use may require the process to have appropriate privileges to use the *getsockopt*( )
37153 function.

37154 The *option_name* argument specifies a single option to be retrieved. It can be one of the socket-
37155 level options defined in **<sys/socket.h>** and described in Section 2.10.16 (on page 528).

37156 **RETURN VALUE**

37157 Upon successful completion, *getsockopt*( ) shall return 0; otherwise, –1 shall be returned and *errno*
37158 set to indicate the error.

37159 **ERRORS**

37160 The *getsockopt*( ) function shall fail if:

37161 [EBADF] The *socket* argument is not a valid file descriptor.

37162 [EINVAL] The specified option is invalid at the specified socket level.

37163 [ENOPROTOOPT]
37164 The option is not supported by the protocol.

37165 [ENOTSOCK] The *socket* argument does not refer to a socket.

37166 The *getsockopt*( ) function may fail if:

37167 [EACCES] The calling process does not have appropriate privileges.

37168 [EINVAL] The socket has been shut down.

37169 [ENOBUFS] Insufficient resources are available in the system to complete the function.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getsockopt*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/47 is applied, updating the description of SO_LINGER in the DESCRIPTION so that it blocks the calling thread rather than the process.

Issue 7

Austin Group Interpretation 1003.1-2001 #158 is applied, removing text relating to socket options that is now in Section 2.10.16 (on page 528).

NAME

getsubopt — parse suboption arguments from a string

SYNOPSIS

CX
```
#include <stdlib.h>

int getsubopt(char **optionp, char * const *keylistp, char **valuep);
```

DESCRIPTION

The *getsubopt*( ) function shall parse suboption arguments in a flag argument. Such options often result from the use of *getopt*( ).

The *getsubopt*( ) argument *optionp* is a pointer to a pointer to the option argument string. The suboption arguments shall be separated by <comma> characters and each may consist of either a single token, or a token-value pair separated by an <equals-sign>.

The *keylistp* argument shall be a pointer to a vector of strings. The end of the vector is identified by a null pointer. Each entry in the vector is one of the possible tokens that might be found in **optionp*. Since <comma> characters delimit suboption arguments in *optionp*, they should not appear in any of the strings pointed to by *keylistp*. Similarly, because an <equals-sign> separates a token from its value, the application should not include an <equals-sign> in any of the strings pointed to by *keylistp*. The *getsubopt*( ) function shall not modify the *keylistp* vector.

The *valuep* argument is the address of a value string pointer.

If a <comma> appears in *optionp*, it shall be interpreted as a suboption separator. After <comma> characters have been processed, if there are one or more <equals-sign> characters in a suboption string, the first <equals-sign> in any suboption string shall be interpreted as a separator between a token and a value. Subsequent <equals-sign> characters in a suboption string shall be interpreted as part of the value.

If the string at **optionp* contains only one suboption argument (equivalently, no <comma> characters), *getsubopt*( ) shall update **optionp* to point to the null character at the end of the string. Otherwise, it shall isolate the suboption argument by replacing the <comma> separator with a null character, and shall update **optionp* to point to the start of the next suboption argument. If the suboption argument has an associated value (equivalently, contains an <equals-sign>), *getsubopt*( ) shall update **valuep* to point to the value's first character. Otherwise, it shall set **valuep* to a null pointer. The calling application may use this information to determine whether the presence or absence of a value for the suboption is an error.

Additionally, when *getsubopt*( ) fails to match the suboption argument with a token in the *keylistp* array, the calling application should decide if this is an error, or if the unrecognized option should be processed in another way.

RETURN VALUE

The *getsubopt*( ) function shall return the index of the matched token string, or –1 if no token strings were matched.

ERRORS

No errors are defined.

EXAMPLES

Parsing Suboptions

The following example uses the *getsubopt*( ) function to parse a *value* argument in the *optarg* external variable returned by a call to *getopt*( ).

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>

int do_all;
const char *type;
int read_size;
int write_size;
int read_only;

enum
{
    RO_OPTION = 0,
    RW_OPTION,
    READ_SIZE_OPTION,
    WRITE_SIZE_OPTION
};

const char *mount_opts[] =
{
    [RO_OPTION] = "ro",
    [RW_OPTION] = "rw",
    [READ_SIZE_OPTION] = "rsize",
    [WRITE_SIZE_OPTION] = "wsize",
    NULL
};

int
main(int argc, char *argv[])
{
    char *subopts, *value;
    int opt;

    while ((opt = getopt(argc, argv, "at:o:")) != -1)
        switch(opt)
            {
            case 'a':
                do_all = 1;
                break;
            case 't':
                type = optarg;
                break;
            case 'o':
                subopts = optarg;
                while (*subopts != ' ')
                {
                    char *saved = subopts;
                    switch(getsubopt(&subopts, (char **)mount_opts,
```

```
                                &value))
                            {
                            case RO_OPTION:
                                read_only = 1;
                                break;
                            case RW_OPTION:
                                read_only = 0;
                                break;
                            case READ_SIZE_OPTION:
                                if (value == NULL)
                                    abort();
                                read_size = atoi(value);
                                break;
                            case WRITE_SIZE_OPTION:
                                if (value == NULL)
                                    abort();
                                write_size = atoi(value);
                                break;
                            default:
                                /* Unknown suboption. */
                                printf("Unknown suboption `%s'\n", saved);
                                abort();
                            }
                        }
                        break;
                    default:
                        abort();
                    }

            /* Do the real work. */

            return 0;
        }
```

If the above example is invoked with:

```
program -o ro,rsize=512
```

then after option parsing, the variable *do_all* will be 0, *type* will be a null pointer, *read_size* will be 512, *write_size* will be 0, and *read_only* will be 1. If it is invoked with:

```
program -o oops
```

it will print:

```
"Unknown suboption `oops'"
```

before aborting.

APPLICATION USAGE

The value of **valuep* when *getsubopt*() returns –1 is unspecified. Historical implementations provide various incompatible extensions to allow an application to access the suboption text that was not found in the *keylistp* array.

37319 **RATIONALE**

37320 The *keylistp* argument of *getsubopt*( ) is typed as **char** * **const** * to match historical practice.
37321 However, the standard is clear that implementations will not modify either the array or the
37322 strings contained in the array, as if the argument had been typed **const char** * **const** *.

37323 **FUTURE DIRECTIONS**

37324 None.

NAME

gettimeofday ‡'get the date and time

SYNOPSIS

OB XSI
```
#include <sys/time.h>

int gettimeofday(struct timeval *restrict tp, void *restrict tzp);
```

DESCRIPTION

The *gettimeofday*( ) function shall obtain the current time, expressed as seconds and microseconds since the Epoch, and store it in the **timeval** structure pointed to by *tp*. The resolution of the system clock is unspecified.

If *tzp* is not a null pointer, the behavior is unspecified.

RETURN VALUE

The *gettimeofday*( ) function shall return 0 and no value shall be reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Applications should use the *clock_gettime*( ) function instead of the obsolescent *gettimeofday*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

The *gettimeofday*( ) function may be removed in a future version.

SEE ALSO

clock_getres( ), *ctime*( )

XBD **<sys/time.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The DESCRIPTION is updated to refer to ``seconds since the Epoch'' rather than ``seconds since 00:00:00 UTC (Coordinated Universal Time), January 1 1970'' for consistency with other *time* functions.

The **restrict** keyword is added to the *gettimeofday*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *gettimeofday*( ) function is marked obsolescent.

NAME

getuid — get a real user ID

SYNOPSIS

```
#include <unistd.h>

uid_t getuid(void);
```

DESCRIPTION

The *getuid*( ) function shall return the real user ID of the calling process. The *getuid*( ) function shall not modify *errno*.

RETURN VALUE

The *getuid*( ) function shall always be successful and no return value is reserved to indicate the error.

ERRORS

No errors are defined.

EXAMPLES

Setting the Effective User ID to the Real User ID

The following example sets the effective user ID of the calling process to the real user ID.

```
#include <unistd.h>
...
seteuid(getuid());
```

APPLICATION USAGE

None.

RATIONALE

In a conforming environment, *getuid*( ) will always succeed. It is possible for implementations to provide an extension where a process in a non-conforming environment will not be associated with a user or group ID. It is recommended that such implementations return (**uid_t**)–1 and set *errno* to indicate such an environment; doing so does not violate this standard, since such an environment is already an extension.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

> The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

Issue 7

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0175 [511] and XSH/TC2-2008/0176 [897] are applied.

NAME

getutxent, getutxid, getutxline ‡'get user accounting database entries

SYNOPSIS

XSI
```
#include <utmpx.h>

struct utmpx *getutxent(void);
struct utmpx *getutxid(const struct utmpx *id);
struct utmpx *getutxline(const struct utmpx *line);
```

DESCRIPTION

Refer to *endutxent( )*.

NAME

getwc — get a wide character from a stream

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

wint_t getwc(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *getwc*( ) function shall be equivalent to *fgetwc*( ), except that if it is implemented as a macro it may evaluate *stream* more than once, so the argument should never be an expression with side-effects.

RETURN VALUE

Refer to *fgetwc*( ).

ERRORS

Refer to *fgetwc*( ).

EXAMPLES

None.

APPLICATION USAGE

Since it may be implemented as a macro, *getwc*( ) may treat incorrectly a *stream* argument with side-effects. In particular, *getwc*(*f*++) does not necessarily work as expected. Therefore, use of this function is not recommended; *fgetwc*( ) should be used instead.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working draft.

Issue 5

The Optional Header (OH) marking is removed from **<stdio.h>**.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0270 [14] is applied.

NAME

getwchar — get a wide character from a *stdin* stream

SYNOPSIS

```
#include <wchar.h>

wint_t getwchar(void);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *getwchar*( ) function shall be equivalent to *getwc*(*stdin*).

RETURN VALUE

Refer to *fgetwc*( ).

ERRORS

Refer to *fgetwc*( ).

EXAMPLES

None.

APPLICATION USAGE

If the **wint_t** value returned by *getwchar*( ) is stored into a variable of type **wchar_t** and then compared against the **wint_t** macro WEOF, the result may be incorrect. Only the **wint_t** type is guaranteed to be able to represent any wide character and WEOF.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

glob, globfree — generate pathnames matching a pattern

SYNOPSIS

```
#include <glob.h>

int glob(const char *restrict pattern, int flags,
    int(*errfunc)(const char *epath, int eerrno),
    glob_t *restrict pglob);
void globfree(glob_t *pglob);
```

DESCRIPTION

The *glob*( ) function is a pathname generator that shall implement the rules defined in XCU Section 2.13 (on page 2382), with optional support for rule 3 in XCU Section 2.13.3 (on page 2383).

The structure type **glob_t** is defined in **<glob.h>** and includes at least the following members:

Member Type	Member Name	Description
size_t	*gl_pathc*	Count of paths matched by *pattern*.
**char ** **	*gl_pathv*	Pointer to a list of matched pathnames.
size_t	*gl_offs*	Slots to reserve at the beginning of *gl_pathv*.

The argument *pattern* is a pointer to a pathname pattern to be expanded. The *glob*( ) function shall match all accessible pathnames against this pattern and develop a list of all pathnames that match. In order to have access to a pathname, *glob*( ) requires search permission on every component of a path except the last, and read permission on each directory of any filename component of *pattern* that contains any of the following special characters: `'*'`, `'?'`, and `'['`.

The *glob*( ) function shall store the number of matched pathnames into *pglob* ~~->~~*gl_pathc* and a pointer to a list of pointers to pathnames into *pglob* ~~->~~*gl_pathv*. The pathnames shall be in sort order as defined by the current setting of the *LC_COLLATE* category; see XBD Section 7.3.2 (on page 147). The first pointer after the last pathname shall be a null pointer. If the pattern does not match any pathnames, the returned number of matched paths is set to 0, and the contents of *pglob* ~~->~~*gl_pathv* are implementation-defined.

It is the caller's responsibility to create the structure pointed to by *pglob*. The *glob*( ) function shall allocate other space as needed, including the memory pointed to by *gl_pathv*. The *globfree*( ) function shall free any space associated with *pglob* from a previous call to *glob*( ).

The *flags* argument is used to control the behavior of *glob*( ). The value of *flags* is a bitwise-inclusive OR of zero or more of the following constants, which are defined in **<glob.h>**:

GLOB_APPEND — Append pathnames generated to the ones from a previous call to *glob*( ).

GLOB_DOOFFS — Make use of *pglob* ~~->~~*gl_offs*. If this flag is set, *pglob* ~~->~~*gl_offs* is used to specify how many null pointers to add to the beginning of *pglob* ~~->~~*gl_pathv*. In other words, *pglob* ~~->~~*gl_pathv* shall point to *pglob* ~~->~~*gl_offs* null pointers, followed by *pglob* ~~->~~*gl_pathc* pathname pointers, followed by a null pointer.

GLOB_ERR — Cause *glob*( ) to return when it encounters a directory that it cannot open or read. Ordinarily, *glob*( ) continues to find matches.

GLOB_MARK — Each pathname that is a directory that matches *pattern* shall have a <slash> appended.

37546 GLOB_NOCHECK Supports rule 3 in XCU Section 2.13.3 (on page 2383). If *pattern* does not
37547 match any pathname, then *glob*( ) shall return a list consisting of only
37548 *pattern*, and the number of matched pathnames is 1.

37549 GLOB_NOESCAPE Disable backslash escaping.

37550 GLOB_NOSORT Ordinarily, *glob*( ) sorts the matching pathnames according to the current
37551 setting of the *LC_COLLATE* category; see XBD Section 7.3.2 (on page 147).
37552 When this flag is used, the order of pathnames returned is unspecified.

37553 The GLOB_APPEND flag can be used to append a new set of pathnames to those found in a
37554 previous call to *glob*( ). The following rules apply to applications when two or more calls to
37555 *glob*( ) are made with the same value of *pglob* and without intervening calls to *globfree*( ):

37556 1. The first such call shall not set GLOB_APPEND. All subsequent calls shall set it.

37557 2. All the calls shall set GLOB_DOOFFS, or all shall not set it.

37558 3. After the second call, *pglob* ~~*gl*~~*_pathv* points to a list containing the following:

37559 a. Zero or more null pointers, as specified by GLOB_DOOFFS and *pglob* ~~*gl*~~*_offs*.

37560 b. Pointers to the pathnames that were in the *pglob* ~~*gl*~~*_pathv* list before the call, in
37561 the same order as before.

37562 c. Pointers to the new pathnames generated by the second call, in the specified order.

37563 4. The count returned in *pglob* ~~*gl*~~*_pathc* shall be the total number of pathnames from the
37564 two calls.

37565 5. The application can change any of the fields after a call to *glob*( ). If it does, the
37566 application shall reset them to the original value before a subsequent call, using the same
37567 *pglob* value, to *globfree*( ) or *glob*( ) with the GLOB_APPEND flag.

37568 If, during the search, a directory is encountered that cannot be opened or read and *errfunc* is not
37569 a null pointer, *glob*( ) calls (**errfunc*( )) with two arguments:

37570 1. The *epath* argument is a pointer to the path that failed.

37571 2. The *eerrno* argument is the value of *errno* from the failure, as set by *opendir*( ), *readdir*( ), or
37572 *stat*( ). (Other values may be used to report other errors not explicitly documented for
37573 those functions.)

37574 If (**errfunc*( )) is called and returns non-zero, or if the GLOB_ERR flag is set in *flags*, *glob*( ) shall
37575 stop the scan and return GLOB_ABORTED after setting *gl_pathc* and *gl_pathv* in *pglob* to reflect
37576 the paths already scanned. If GLOB_ERR is not set and either *errfunc* is a null pointer or
37577 (**errfunc*( )) returns 0, the error shall be ignored.

37578 The *glob*( ) function shall not fail because of large files.

37579 **RETURN VALUE**

37580 Upon successful completion, *glob*( ) shall return 0. The argument *pglob* ~~*gl*~~*_pathc* shall return the
37581 number of matched pathnames and the argument *pglob* ~~*gl*~~*_pathv* shall contain a pointer to a
37582 null-terminated list of matched and sorted pathnames. However, if *pglob* ~~*gl*~~*_pathc* is 0, the
37583 content of *pglob* ~~*gl*~~*_pathv* is undefined.

37584 The *globfree*( ) function shall not return a value.

37585 If *glob*( ) terminates due to an error, it shall return one of the non-zero constants defined in
37586 **<glob.h>**. The arguments *pglob* ~~*gl*~~*_pathc* and *pglob* ~~*gl*~~*_pathv* are still set as defined above.

ERRORS

The *glob*( ) function shall fail and return the corresponding value if:

GLOB_ABORTED The scan was stopped because GLOB_ERR was set or (**errfunc*( )) returned non-zero.

GLOB_NOMATCH The pattern does not match any existing pathname, and GLOB_NOCHECK was not set in flags.

GLOB_NOSPACE An attempt to allocate memory failed.

EXAMPLES

One use of the GLOB_DOOFFS flag is by applications that build an argument list for use with *execv*( ), *execve*( ), or *execvp*( ). Suppose, for example, that an application wants to do the equivalent of:

```
ls -l *.c
```

but for some reason:

```
system("ls -l *.c")
```

is not acceptable. The application could obtain approximately the same result using the sequence:

```
globbuf.gl_offs = 2;
glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
globbuf.gl_pathv[0] = "ls";
globbuf.gl_pathv[1] = "-l";
execvp("ls", &globbuf.gl_pathv[0]);
```

Using the same example:

```
ls -l *.c *.h
```

could be approximately simulated using GLOB_APPEND as follows:

```
globbuf.gl_offs = 2;
glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
glob("*.h", GLOB_DOOFFS|GLOB_APPEND, NULL, &globbuf);
...
```

APPLICATION USAGE

This function is not provided for the purpose of enabling utilities to perform pathname expansion on their arguments, as this operation is performed by the shell, and utilities are explicitly not expected to redo this. Instead, it is provided for applications that need to do pathname expansion on strings obtained from other sources, such as a pattern typed by a user or read from a file.

If a utility needs to see if a pathname matches a given pattern, it can use *fnmatch*( ).

Note that *gl_pathc* and *gl_pathv* have meaning even if *glob*( ) fails. This allows *glob*( ) to report partial results in the event of an error. However, if *gl_pathc* is 0, *gl_pathv* is unspecified even if *glob*( ) did not return an error.

The GLOB_NOCHECK option could be used when an application wants to expand a pathname if wildcards are specified, but wants to treat the pattern as just a string otherwise. The *sh* utility might use this for option-arguments, for example.

The new pathnames generated by a subsequent call with GLOB_APPEND are not sorted together with the previous pathnames. This mirrors the way that the shell handles pathname

expansion when multiple expansions are done on a command line.

Applications that need tilde and parameter expansion should use *wordexp*( ).

RATIONALE

It was claimed that the GLOB_DOOFFS flag is unnecessary because it could be simulated using:

```
new = (char **)malloc((n + pglob->gl_pathc + 1)
       * sizeof(char *));
(void) memcpy(new+n, pglob->gl_pathv,
       pglob->gl_pathc * sizeof(char *));
(void) memset(new, 0, n * sizeof(char *));
free(pglob->gl_pathv);
pglob->gl_pathv = new;
```

However, this assumes that the memory pointed to by *gl_pathv* is a block that was separately created using *malloc*( ). This is not necessarily the case. An application should make no assumptions about how the memory referenced by fields in *pglob* was allocated. It might have been obtained from *malloc*( ) in a large chunk and then carved up within *glob*( ), or it might have been created using a different memory allocator. It is not the intent of the standard developers to specify or imply how the memory used by *glob*( ) is managed.

The GLOB_APPEND flag would be used when an application wants to expand several different patterns into a single list.

FUTURE DIRECTIONS

None.

XBD Section 7.3.2 (on page 147), **<glob.h>**

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

Moved from POSIX2 C-language Binding to BASE.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

The **restrict** keyword is added to the *glob*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

NAME

gmtime, gmtime_r — convert a time value to a broken-down UTC time

SYNOPSIS

```
#include <time.h>

struct tm *gmtime(const time_t *timer);
CX struct tm *gmtime_r(const time_t *restrict timer,
        struct tm *restrict result);
```

DESCRIPTION

CX For *gmtime*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *gmtime*( ) function shall convert the time in seconds since the Epoch pointed to by *timer* into a broken-down time, expressed as Coordinated Universal Time (UTC).

CX The relationship between a time in seconds since the Epoch used as an argument to *gmtime*( ) and the **tm** structure (defined in the **<time.h>** header) is that the result shall be as specified in the expression given in the definition of seconds since the Epoch (see XBD Section 4.16, on page 113), where the names in the structure and in the expression correspond.

The same relationship shall apply for *gmtime_r*( ).

The *gmtime*( ) function need not be thread-safe.

The *asctime*( ), *ctime*( ), *gmtime*( ), and *localtime*( ) functions shall return values in one of two static objects: a broken-down time structure and an array of type **char**. Execution of any of the functions may overwrite the information returned in either of these objects by any of the other functions.

The *gmtime_r*( ) function shall convert the time in seconds since the Epoch pointed to by *timer* into a broken-down time expressed as Coordinated Universal Time (UTC). The broken-down time is stored in the structure referred to by *result*. The *gmtime_r*( ) function shall also return the address of the same structure.

RETURN VALUE

Upon successful completion, the *gmtime*( ) function shall return a pointer to a **struct tm**. If an CX error is detected, *gmtime*( ) shall return a null pointer and set *errno* to indicate the error.

Upon successful completion, *gmtime_r*( ) shall return the address of the structure pointed to by the argument *result*. If an error is detected, *gmtime_r*( ) shall return a null pointer and set *errno* to indicate the error.

ERRORS

CX The *gmtime*( ) and *gmtime_r*( ) functions shall fail if:

CX [EOVERFLOW] The result cannot be represented.

EXAMPLES

None.

APPLICATION USAGE

The *gmtime_r*( ) function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.16 (on page 113), **<time.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that the *gmtime*( ) function need not be reentrant is added to the DESCRIPTION.

The *gmtime_r*( ) function is included for alignment with the POSIX Threads Extension.

Issue 6

The *gmtime_r*( ) function is marked as part of the Thread-Safe Functions option.

Extensions beyond the ISO C standard are marked.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *gmtime_r*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/27 is applied, adding the [EOVERFLOW] error.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/48 is applied, updating the error handling for *gmtime_r*( ).

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

The *gmtime_r*( ) function is moved from the Thread-Safe Functions option to the Base.

NAME

grantpt ‡'grant access to the slave pseudo-terminal device

SYNOPSIS

XSI
```
#include <stdlib.h>

int grantpt(int fildes);
```

DESCRIPTION

The *grantpt*( ) function shall change the mode and ownership of the slave pseudo-terminal device associated with its master pseudo-terminal counterpart. The *fildes* argument is a file descriptor that refers to a master pseudo-terminal device. The user ID of the slave shall be set to the real UID of the calling process and the group ID shall be set to an unspecified group ID. The permission mode of the slave pseudo-terminal shall be set to readable and writable by the owner, and writable by the group.

The behavior of the *grantpt*( ) function is unspecified if the application has installed a signal handler to catch SIGCHLD signals.

RETURN VALUE

Upon successful completion, *grantpt*( ) shall return 0; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *grantpt*( ) function may fail if:

[EACCES] The corresponding slave pseudo-terminal device could not be accessed.

[EBADF] The *fildes* argument is not a valid open file descriptor.

[EINVAL] The *fildes* argument is not associated with a master pseudo-terminal device.

NAME

hcreate, hdestroy, hsearch — manage hash search table

SYNOPSIS

XSI
```
#include <search.h>

int hcreate(size_t nel);
void hdestroy(void);
ENTRY *hsearch(ENTRY item, ACTION action);
```

DESCRIPTION

The *hcreate*( ), *hdestroy*( ), and *hsearch*( ) functions shall manage hash search tables.

The *hcreate*( ) function shall allocate sufficient space for the table, and the application shall ensure it is called before *hsearch*( ) is used. The *nel* argument is an estimate of the maximum number of entries that the table shall contain. This number may be adjusted upward by the algorithm in order to obtain certain mathematically favorable circumstances.

The *hdestroy*( ) function shall dispose of the search table, and may be followed by another call to *hcreate*( ). After the call to *hdestroy*( ), the data can no longer be considered accessible.

The *hsearch*( ) function is a hash-table search routine. It shall return a pointer into a hash table indicating the location at which an entry can be found. The *item* argument is a structure of type **ENTRY** (defined in the **<search.h>** header) containing two pointers: *item.key* points to the comparison key (a **char** *), and *item.data* (a **void** *) points to any other data to be associated with that key. The comparison function used by *hsearch*( ) is *strcmp*( ). The *action* argument is a member of an enumeration type **ACTION** indicating the disposition of the entry if it cannot be found in the table. ENTER indicates that the item should be inserted in the table at an appropriate point. FIND indicates that no entry should be made. Unsuccessful resolution is indicated by the return of a null pointer.

These functions need not be thread-safe.

RETURN VALUE

The *hcreate*( ) function shall return 0 if it cannot allocate sufficient space for the table; otherwise, it shall return non-zero.

The *hdestroy*( ) function shall not return a value.

The *hsearch*( ) function shall return a null pointer if either the action is FIND and the item could not be found or the action is ENTER and the table is full.

ERRORS

The *hcreate*( ) and *hsearch*( ) functions may fail if:

[ENOMEM] Insufficient storage space is available.

EXAMPLES

The following example reads in strings followed by two numbers and stores them in a hash table, discarding duplicates. It then reads in strings and finds the matching entry in the hash table and prints it out.

```
#include <stdio.h>
#include <search.h>
#include <string.h>

struct info {        /* This is the info stored in the table */
    int age, room;   /* other than the key. */
};
```

```
#define NUM_EMPL    5000    /* # of elements in search table. */

int main(void)
{
    char string_space[NUM_EMPL*20];   /* Space to store strings. */
    struct info info_space[NUM_EMPL]; /* Space to store employee info. */
    char *str_ptr = string_space;     /* Next space in string_space. */
    struct info *info_ptr = info_space;
                                      /* Next space in info_space. */
    ENTRY item;
    ENTRY *found_item; /* Name to look for in table. */
    char name_to_find[30];

    int i = 0;

    /* Create table; no error checking is performed. */
    (void) hcreate(NUM_EMPL);
    while (scanf("%s%d%d", str_ptr, &info_ptr->age,
           &info_ptr->room) != EOF && i++ < NUM_EMPL) {

        /* Put information in structure, and structure in item. */
        item.key = str_ptr;
        item.data = info_ptr;
        str_ptr += strlen(str_ptr) + 1;
        info_ptr++;

        /* Put item into table. */
        (void) hsearch(item, ENTER);
    }

    /* Access table. */
    item.key = name_to_find;
    while (scanf("%s", item.key) != EOF) {
        if ((found_item = hsearch(item, FIND)) != NULL) {

            /* If item is in the table. */
            (void)printf("found %s, age = %d, room = %d\n",
                found_item->key,
                ((struct info *)found_item->data)->age,
                ((struct info *)found_item->data)->room);
        } else
            (void)printf("no such employee %s\n", name_to_find);
    }
    return 0;
}
```

APPLICATION USAGE

The *hcreate*( ) and *hsearch*( ) functions may use *malloc*( ) to allocate space.

RATIONALE

None.

FUTURE DIRECTIONS

37869 **NAME**

37870 htonl, htons, ntohl, ntohs — convert values between host and network byte order

37871 **SYNOPSIS**

37872 `#include <arpa/inet.h>`

37873 `uint32_t htonl(uint32_t hostlong);`
37874 `uint16_t htons(uint16_t hostshort);`
37875 `uint32_t ntohl(uint32_t netlong);`
37876 `uint16_t ntohs(uint16_t netshort);`

37877 **DESCRIPTION**

37878 These functions shall convert 16-bit and 32-bit quantities between network byte order and host
37879 byte order.

37880 On some implementations, these functions are defined as macros.

37881 The **uint32_t** and **uint16_t** types are defined in **<inttypes.h>**.

37882 **RETURN VALUE**

37883 The *htonl*( ) and *htons*( ) functions shall return the argument value converted from host to
37884 network byte order.

37885 The *ntohl*( ) and *ntohs*( ) functions shall return the argument value converted from network to
37886 host byte order.

37887 **ERRORS**

37888 No errors are defined.

37889 **EXAMPLES**

37890 None.

37891 **APPLICATION USAGE**

37892 These functions are most often used in conjunction with IPv4 addresses and ports as returned by
37893 *gethostent*( ) and *getservent*( ).

37894 **RATIONALE**

37895 None.

37896 **FUTURE DIRECTIONS**

37897 None.

37902 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

hypot, hypotf, hypotl ‡'Euclidean distance function

SYNOPSIS

```
#include <math.h>

double hypot(double x, double y);
float hypotf(float x, float y);
long double hypotl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall compute the value of the square root of x^2+y^2 without undue overflow or underflow.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the length of the hypotenuse of a right-angled triangle with sides of length *x* and *y*.

If the correct value would cause overflow, a range error shall occur and *hypot*( ), *hypotf*( ), and *hypotl*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

MX If *x* or *y* is ±Inf, +Inf shall be returned (even if one of *x* or *y* is NaN).

If *x* or *y* is NaN, and the other is not ±Inf, a NaN shall be returned.

MXX If both arguments are subnormal and the correct result is subnormal, a range error may occur and the correct result shall be returned.

ERRORS

These functions shall fail if:

Range Error — The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

MX Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

See the EXAMPLES section in *atan2*( ).

APPLICATION USAGE

hypot(*x*,*y*), *hypot*(*y*,*x*), and *hypot*(*x*, –*y*) are equivalent.

hypot(*x*, ±0) is equivalent to *fabs*(*x*).

Underflow only happens when both *x* and *y* are subnormal and the (inexact) result is also subnormal.

These functions take precautions against overflow during intermediate steps of the computation.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *hypot*( ) function is no longer marked as an extension.

The *hypotf*( ) and *hypotl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/49 is applied, updating the EXAMPLES section.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0273 [68] is applied.

NAME

iconv ‡'codeset conversion function

SYNOPSIS

```
#include <iconv.h>

size_t iconv(iconv_t cd, char **restrict inbuf,
    size_t *restrict inbytesleft, char **restrict outbuf,
    size_t *restrict outbytesleft);
```

DESCRIPTION

The *iconv*( ) function shall convert the sequence of characters from one codeset, in the array specified by *inbuf*, into a sequence of corresponding characters in another codeset, in the array specified by *outbuf*. The codesets are those specified in the *iconv_open*( ) call that returned the conversion descriptor, *cd*. The *inbuf* argument points to a variable that points to the first character in the input buffer and *inbytesleft* indicates the number of bytes to the end of the buffer to be converted. The *outbuf* argument points to a variable that points to the first available byte in the output buffer and *outbytesleft* indicates the number of the available bytes to the end of the buffer.

For state-dependent encodings, the conversion descriptor *cd* is placed into its initial shift state by a call for which *inbuf* is a null pointer, or for which *inbuf* points to a null pointer. When *iconv*( ) is called in this way, and if *outbuf* is not a null pointer or a pointer to a null pointer, and *outbytesleft* points to a positive value, *iconv*( ) shall place, into the output buffer, the byte sequence to change the output buffer to its initial shift state. If the output buffer is not large enough to hold the entire reset sequence, *iconv*( ) shall fail and set *errno* to [E2BIG]. Subsequent calls with *inbuf* as other than a null pointer or a pointer to a null pointer cause the conversion to take place from the current state of the conversion descriptor.

If a sequence of input bytes does not form a valid character in the specified codeset, conversion shall stop after the previous successfully converted character. If the input buffer ends with an incomplete character or shift sequence, conversion shall stop after the previous successfully converted bytes. If the output buffer is not large enough to hold the entire converted input, conversion shall stop just prior to the input bytes that would cause the output buffer to overflow. The variable pointed to by *inbuf* shall be updated to point to the byte following the last byte successfully used in the conversion. The value pointed to by *inbytesleft* shall be decremented to reflect the number of bytes still not converted in the input buffer. The variable pointed to by *outbuf* shall be updated to point to the byte following the last byte of converted output data. The value pointed to by *outbytesleft* shall be decremented to reflect the number of bytes still available in the output buffer. For state-dependent encodings, the conversion descriptor shall be updated to reflect the shift state in effect at the end of the last successfully converted byte sequence.

If *iconv*( ) encounters a character in the input buffer that is valid, but for which an identical character does not exist in the target codeset, *iconv*( ) shall perform an implementation-defined conversion on this character.

RETURN VALUE

The *iconv*( ) function shall update the variables pointed to by the arguments to reflect the extent of the conversion and return the number of non-identical conversions performed. If the entire string in the input buffer is converted, the value pointed to by *inbytesleft* shall be 0. If the input conversion is stopped due to any conditions mentioned above, the value pointed to by *inbytesleft* shall be non-zero and *errno* shall be set to indicate the condition. If an error occurs, *iconv*( ) shall return (**size_t**)–1 and set *errno* to indicate the error.

38024 **ERRORS**

38025 The *iconv*( ) function shall fail if:

38026 [EILSEQ] Input conversion stopped due to an input byte that does not belong to the
38027 input codeset.

38028 [E2BIG] Input conversion stopped due to lack of space in the output buffer.

38029 [EINVAL] Input conversion stopped due to an incomplete character or shift sequence at
38030 the end of the input buffer.

38031 The *iconv*( ) function may fail if:

38032 [EBADF] The *cd* argument is not a valid open conversion descriptor.

38033 **EXAMPLES**

38034 None.

38035 **APPLICATION USAGE**

38036 The *inbuf* argument indirectly points to the memory area which contains the conversion input
38037 data. The *outbuf* argument indirectly points to the memory area which is to contain the result of
38038 the conversion. The objects indirectly pointed to by *inbuf* and *outbuf* are not restricted to
38039 containing data that is directly representable in the ISO C standard language **char** data type. The
38040 type of *inbuf* and *outbuf*, **char** **, does not imply that the objects pointed to are interpreted as
38041 null-terminated C strings or arrays of characters. Any interpretation of a byte sequence that
38042 represents a character in a given character set encoding scheme is done internally within the
38043 codeset converters. For example, the area pointed to indirectly by *inbuf* and/or *outbuf* can
38044 contain all zero octets that are not interpreted as string terminators but as coded character data
38045 according to the respective codeset encoding scheme. The type of the data (**char**, **short**, **long**, and
38046 so on) read or stored in the objects is not specified, but may be inferred for both the input and
38047 output data by the converters determined by the *fromcode* and *tocode* arguments of *iconv_open*( ).

38048 Regardless of the data type inferred by the converter, the size of the remaining space in both
38049 input and output objects (the *intbytesleft* and *outbytesleft* arguments) is always measured in bytes.

38050 For implementations that support the conversion of state-dependent encodings, the conversion
38051 descriptor must be able to accurately reflect the shift-state in effect at the end of the last
38052 successful conversion. It is not required that the conversion descriptor itself be updated, which
38053 would require it to be a pointer type. Thus, implementations are free to implement the
38054 descriptor as a handle (other than a pointer type) by which the conversion information can be
38055 accessed and updated.

38056 **RATIONALE**

38057 None.

38058 **FUTURE DIRECTIONS**

38063 **CHANGE HISTORY**

38064 First released in Issue 4. Derived from the HP-UX Manual.

38065 **Issue 6**

38066 The SYNOPSIS has been corrected to align with the **<iconv.h>** reference page.

38067 The **restrict** keyword is added to the *iconv*( ) prototype for alignment with the
38068 ISO/IEC 9899: 1999 standard.

38069 **Issue 7**

38070 The *iconv*( ) function is moved from the XSI option to the Base.

38071 **NAME**

38072 iconv_close ‡'codeset conversion deallocation function

38073 **SYNOPSIS**

38074
```
#include <iconv.h>
```

38075
```
int iconv_close(iconv_t cd);
```

38076 **DESCRIPTION**

38077 The *iconv_close*( ) function shall deallocate the conversion descriptor *cd* and all other associated
38078 resources allocated by *iconv_open*( ).

38079 If a file descriptor is used to implement the type **iconv_t**, that file descriptor shall be closed.

38080 **RETURN VALUE**

38081 Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned and *errno* set to
38082 indicate the error.

38083 **ERRORS**

38084 The *iconv_close*( ) function may fail if:

38085 [EBADF] The conversion descriptor is invalid.

38086 **EXAMPLES**

38087 None.

38088 **APPLICATION USAGE**

38089 None.

38090 **RATIONALE**

38091 None.

38092 **FUTURE DIRECTIONS**

38093 None.

38094 **SEE ALSO**

38095 *iconv*( ), *iconv_open*( )

38096 XBD **<iconv.h>**

38097 **CHANGE HISTORY**

38098 First released in Issue 4. Derived from the HP-UX Manual.

38099 **Issue 7**

38100 The *iconv_close*( ) function is moved from the XSI option to the Base.

38101 **NAME**

38102 iconv_open ‡'codeset conversion allocation function

38103 **SYNOPSIS**

38104 `#include <iconv.h>`

38105 `iconv_t iconv_open(const char *tocode, const char *fromcode);`

38106 **DESCRIPTION**

38107 The *iconv_open*( ) function shall return a conversion descriptor that describes a conversion from
38108 the codeset specified by the string pointed to by the *fromcode* argument to the codeset specified
38109 by the string pointed to by the *tocode* argument. For state-dependent encodings, the conversion
38110 descriptor shall be in a codeset-dependent initial shift state, ready for immediate use with
38111 *iconv*( ).

38112 Settings of *fromcode* and *tocode* and their permitted combinations are implementation-defined.

38113 A conversion descriptor shall remain valid until it is closed by *iconv_close*( ) or an implicit close.

38114 If a file descriptor is used to implement conversion descriptors, the FD_CLOEXEC flag shall be
38115 set; see **<fcntl.h>**.

38116 **RETURN VALUE**

38117 Upon successful completion, *iconv_open*( ) shall return a conversion descriptor for use on
38118 subsequent calls to *iconv*( ). Otherwise, *iconv_open*( ) shall return (**iconv_t**)–1 and set *errno* to
38119 indicate the error.

38120 **ERRORS**

38121 The *iconv_open*( ) function may fail if:

38122 [EMFILE] All file descriptors available to the process are currently open.

38123 [ENFILE] Too many files are currently open in the system.

38124 [ENOMEM] Insufficient storage space is available.

38125 [EINVAL] The conversion specified by *fromcode* and *tocode* is not supported by the
38126 implementation.

38127 **EXAMPLES**

38128 None.

38129 **APPLICATION USAGE**

38130 Some implementations of *iconv_open*( ) use *malloc*( ) to allocate space for internal buffer areas.
38131 The *iconv_open*( ) function may fail if there is insufficient storage space to accommodate these
38132 buffers.

38133 Conforming applications must assume that conversion descriptors are not valid after a call to
38134 one of the *exec* functions.

38135 Application developers should consult the system documentation to determine the supported
38136 codesets and their naming schemes.

38137 **RATIONALE**

38138 None.

38175 **NAME**

38176 if_indextoname — map a network interface index to its corresponding name

38177 **SYNOPSIS**

38178 `#include <net/if.h>`

38179 `char *if_indextoname(unsigned ifindex, char *ifname);`

38180 **DESCRIPTION**

38181 The *if_indextoname*( ) function shall map an interface index to its corresponding name.

38182 When this function is called, *ifname* shall point to a buffer of at least {IF_NAMESIZE} bytes. The
38183 function shall place in this buffer the name of the interface with index *ifindex*.

38184 **RETURN VALUE**

38185 If *ifindex* is an interface index, then the function shall return the value supplied in *ifname*, which
38186 points to a buffer now containing the interface name. Otherwise, the function shall return a null
38187 pointer and set *errno* to indicate the error.

38188 **ERRORS**

38189 The *if_indextoname*( ) function shall fail if:

38190 [ENXIO] The interface does not exist.

38203 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

38204 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/28 is applied, changing {IFNAMSIZ} to
38205 {IF_NAMESIZ} in the DESCRIPTION.

NAME

if_nameindex — return all network interface names and indexes

SYNOPSIS

```
#include <net/if.h>

struct if_nameindex *if_nameindex(void);
```

DESCRIPTION

The *if_nameindex*( ) function shall return an array of *if_nameindex* structures, one structure per interface. The end of the array is indicated by a structure with an *if_index* field of zero and an *if_name* field of NULL.

Applications should call *if_freenameindex*( ) to release the memory that may be dynamically allocated by this function, after they have finished using it.

RETURN VALUE

An array of structures identifying local interfaces. A null pointer is returned upon an error, with *errno* set to indicate the error.

ERRORS

The *if_nameindex*( ) function may fail if:

[ENOBUFS] Insufficient resources are available to complete the function.

NAME

if_nametoindex — map a network interface name to its corresponding index

SYNOPSIS

```
#include <net/if.h>

unsigned if_nametoindex(const char *ifname);
```

DESCRIPTION

The *if_nametoindex*( ) function shall return the interface index corresponding to name *ifname*.

RETURN VALUE

The corresponding index if *ifname* is the name of an interface; otherwise, zero.

ERRORS

No errors are defined.

EXAMPLES

None.

NAME

ilogb, ilogbf, ilogbl — return an unbiased exponent

SYNOPSIS

```
#include <math.h>

int ilogb(double x);
int ilogbf(float x);
int ilogbl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall return the exponent part of their argument x. Formally, the return value is the integral part of $\log_r |x|$ as a signed integral value, for non-zero x, where r is the radix of the machine's floating-point arithmetic, which is the value of FLT_RADIX defined in **<float.h>**.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the exponent part of x as a signed integer value. They are equivalent to calling the corresponding *logb*( ) function and casting the returned value to type **int**.

XSI If x is 0, the value FP_ILOGB0 shall be returned. On XSI-conformant systems, a domain error shall occur;
CX otherwise, a domain error may occur.

XSI If x is ±Inf, the value {INT_MAX} shall be returned. On XSI-conformant systems, a domain error shall occur;
CX otherwise, a domain error may occur.

XSI If x is a NaN, the value FP_ILOGBNAN shall be returned. On XSI-conformant systems, a domain error shall occur;
CX otherwise, a domain error may occur.

MX If the correct value is greater than {INT_MAX}, a domain error shall occur and an unspecified
XSI value shall be returned. On XSI-conformant systems, a domain error shall occur and {INT_MAX} shall be returned.

MX If the correct value is less than {INT_MIN}, a domain error shall occur and an unspecified value
XSI shall be returned. On XSI-conformant systems, a domain error shall occur and {INT_MIN} shall be returned.

ERRORS

These functions shall fail if:

XSI|MX Domain Error	The correct value is not representable as an integer.
XSI	The x argument is zero, NaN, or ±Inf.
XSI|MX	If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Domain Error — The *x* argument is zero, NaN, or ±Inf.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

The errors come from taking the expected floating-point value and converting it to **int**, which is an invalid operation in IEEE Std 754-1985 (since overflow, infinity, and NaN are not representable in a type **int**), so should be a domain error.

There are no known implementations that overflow. For overflow to happen, {INT_MAX} must be less than LDBL_MAX_EXP**log2*(FLT_RADIX) or {INT_MIN} must be greater than LDBL_MIN_EXP**log2*(FLT_RADIX) if subnormals are not supported, or {INT_MIN} must be greater than (LDBL_MIN_EXP-LDBL_MANT_DIG)**log2*(FLT_RADIX) if subnormals are supported.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The *ilogb*( ) function is no longer marked as an extension.

The *ilogbf*( ) and *ilogbl*( ) functions are added for alignment with the ISO/IEC 9899: 1999 standard.

The RETURN VALUE section is revised for alignment with the ISO/IEC 9899: 1999 standard.

Functionality relating to the XSI option is marked.

Issue 7

ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #48 (SD5-XSH-ERN-71), #49, and #79 (SD5-XSH-ERN-72) are applied.

38343 **NAME**

38344 imaxabs — return absolute value

38345 **SYNOPSIS**

38346 `#include <inttypes.h>`

38347 `intmax_t imaxabs(intmax_t j);`

38348 **DESCRIPTION**

38349 CX The functionality described on this reference page is aligned with the ISO C standard. Any
38350 conflict between the requirements described here and the ISO C standard is unintentional. This
38351 volume of POSIX.1-2017 defers to the ISO C standard.

38352 The *imaxabs*( ) function shall compute the absolute value of an integer *j*. If the result cannot be
38353 represented, the behavior is undefined.

38354 **RETURN VALUE**

38355 The *imaxabs*( ) function shall return the absolute value.

38356 **ERRORS**

38357 No errors are defined.

38358 **EXAMPLES**

38359 None.

38360 **APPLICATION USAGE**

38361 The absolute value of the most negative number cannot be represented in two's complement.

38399 **CHANGE HISTORY**

38400 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

38401 **NAME**

38402 inet_addr, inet_ntoa — IPv4 address manipulation

38403 **SYNOPSIS**

38404 ```
#include <arpa/inet.h>
```

38405 ```
in_addr_t inet_addr(const char *cp);
```

38406 ```
char *inet_ntoa(struct in_addr in);
```

38407 **DESCRIPTION**

38408 The *inet_addr*( ) function shall convert the string pointed to by *cp*, in the standard IPv4 dotted
38409 decimal notation, to an integer value suitable for use as an Internet address.

38410 The *inet_ntoa*( ) function shall convert the Internet host address specified by *in* to a string in the
38411 Internet standard dot notation.

38412 The *inet_ntoa*( ) function need not be thread-safe.

38413 All Internet addresses shall be returned in network order (bytes ordered from left to right).

38414 Values specified using IPv4 dotted decimal notation take one of the following forms:

38415 `a.b.c.d` When four parts are specified, each shall be interpreted as a byte of data and
38416 assigned, from left to right, to the four bytes of an Internet address.

38417 `a.b.c` When a three-part address is specified, the last part shall be interpreted as a 16-bit
38418 quantity and placed in the rightmost two bytes of the network address. This makes
38419 the three-part address format convenient for specifying Class B network addresses
38420 as `"128.net.host"`.

38421 `a.b` When a two-part address is supplied, the last part shall be interpreted as a 24-bit
38422 quantity and placed in the rightmost three bytes of the network address. This
38423 makes the two-part address format convenient for specifying Class A network
38424 addresses as `"net.host"`.

38425 `a` When only one part is given, the value shall be stored directly in the network
38426 address without any byte rearrangement.

38427 All numbers supplied as parts in IPv4 dotted decimal notation may be decimal, octal, or
38428 hexadecimal, as specified in the ISO C standard (that is, a leading 0x or 0X implies hexadecimal;
38429 otherwise, a leading `'0'` implies octal; otherwise, the number is interpreted as decimal).

38430 **RETURN VALUE**

38431 Upon successful completion, *inet_addr*( ) shall return the Internet address. Otherwise, it shall
38432 return (**in_addr_t**)(–1).

38433 The *inet_ntoa*( ) function shall return a pointer to the network address in Internet standard dot
38434 notation.

38435 **ERRORS**

38436 No errors are defined.

  
```

38437 **EXAMPLES**

38438 None.

38439 **APPLICATION USAGE**

38440 The return value of *inet_ntoa*( ) may point to static data that may be overwritten by subsequent
38441 calls to *inet_ntoa*( ).

38442 **RATIONALE**

38443 None.

38444 **FUTURE DIRECTIONS**

38445 None.

38448 XBD **<arpa/inet.h>**

38449 **CHANGE HISTORY**

38450 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

38451 **Issue 7**

38452 Austin Group Interpretation 1003.1-2001 #156 is applied.

NAME

inet_ntop, inet_pton — convert IPv4 and IPv6 addresses between binary and text form

SYNOPSIS

```
#include <arpa/inet.h>

const char *inet_ntop(int af, const void *restrict src,
    char *restrict dst, socklen_t size);
int inet_pton(int af, const char *restrict src, void *restrict dst);
```

DESCRIPTION

The *inet_ntop*( ) function shall convert a numeric address into a text string suitable for presentation. The *af* argument shall specify the family of the address. This can be AF_INET IP6 or AF_INET6. The *src* argument points to a buffer holding an IPv4 address if the *af* argument is AF_INET, IP6 or an IPv6 address if the *af* argument is AF_INET6; the address must be in network byte order. The *dst* argument points to a buffer where the function stores the resulting text string; it shall not be NULL. The *size* argument specifies the size of this buffer, which shall be large enough to hold the text string (INET_ADDRSTRLEN characters for IPv4, IP6 INET6_ADDRSTRLEN characters for IPv6).

The *inet_pton*( ) function shall convert an address in its standard text presentation form into its numeric binary form. The *af* argument shall specify the family of the address. The AF_INET IP6 and AF_INET6 address families shall be supported. The *src* argument points to the string being passed in. The *dst* argument points to a buffer into which the function stores the numeric address; this shall be large enough to hold the numeric address (32 bits for AF_INET, IP6 128 bits for AF_INET6).

If the *af* argument of *inet_pton*( ) is AF_INET, the *src* string shall be in the standard IPv4 dotted-decimal form:

```
ddd.ddd.ddd.ddd
```

where "ddd" is a one to three digit decimal number between 0 and 255 (see *inet_addr*( )). The *inet_pton*( ) function does not accept other formats (such as the octal numbers, hexadecimal numbers, and fewer than four numbers that *inet_addr*( ) accepts).

IP6 If the *af* argument of *inet_pton*( ) is AF_INET6, the *src* string shall be in one of the following standard IPv6 text forms:

1. The preferred form is "x:x:x:x:x:x:x:x", where the 'x's are the hexadecimal values of the eight 16-bit pieces of the address. Leading zeros in individual fields can be omitted, but there shall be one to four hexadecimal digits in every field.
2. A string of contiguous zero fields in the preferred form can be shown as "::". The "::" can only appear once in an address. Unspecified addresses ("0:0:0:0:0:0:0:0") may be represented simply as "::".
3. A third form that is sometimes more convenient when dealing with a mixed environment of IPv4 and IPv6 nodes is "x:x:x:x:x:x:d.d.d.d", where the 'x's are the hexadecimal values of the six high-order 16-bit pieces of the address, and the 'd's are the decimal values of the four low-order 8-bit pieces of the address (standard IPv4 representation).

Note: A more extensive description of the standard representations of IPv6 addresses can be found in RFC 2373.

38496 **RETURN VALUE**

38497 The *inet_ntop*( ) function shall return a pointer to the buffer containing the text string if the
38498 conversion succeeds, and NULL otherwise, and set *errno* to indicate the error.

38499 The *inet_pton*( ) function shall return 1 if the conversion succeeds, with the address pointed to by
38500 IP6 *dst* in network byte order. It shall return 0 if the input is not a valid IPv4 dotted-decimal string
38501 or a valid IPv6 address string, or −1 with *errno* set to [EAFNOSUPPORT] if the *af* argument is
38502 unknown.

38503 **ERRORS**

38504 The *inet_ntop*( ) and *inet_pton*( ) functions shall fail if:

38505 [EAFNOSUPPORT]
38506 The *af* argument is invalid.

38507 [ENOSPC] The size of the *inet_ntop*( ) result buffer is inadequate.

38508 **EXAMPLES**

38509 None.

38510 **APPLICATION USAGE**

38511 None.

38512 **RATIONALE**

38513 None.

38518 **CHANGE HISTORY**

38519 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

38520 IPv6 extensions are marked.

38521 The **restrict** keyword is added to the *inet_ntop*( ) and *inet_pton*( ) prototypes for alignment with
38522 the ISO/IEC 9899:1999 standard.

38523 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/29 is applied, adding ``the address must
38524 be in network byte order'' to the end of the fourth sentence of the first paragraph in the
38525 DESCRIPTION.

38526 **Issue 7**

38527 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0178 [777] is applied.

NAME

initstate, random, setstate, srandom ‡'pseudo-random number functions

SYNOPSIS

XSI
```
#include <stdlib.h>

char *initstate(unsigned seed, char *state, size_t size);
long random(void);
char *setstate(char *state);
void srandom(unsigned seed);
```

DESCRIPTION

The *random*( ) function shall use a non-linear additive feedback random-number generator employing a default state array size of 31 **long** integers to return successive pseudo-random numbers in the range from 0 to 2^{31}–1. The period of this random-number generator is approximately 16 x (2^{31}–1). The size of the state array determines the period of the random-number generator. Increasing the state array size shall increase the period.

With 256 bytes of state information, the period of the random-number generator shall be greater than 2^{69}.

Like *rand*( ), *random*( ) shall produce by default a sequence of numbers that can be duplicated by calling *srandom*( ) with 1 as the seed.

The *srandom*( ) function shall initialize the current state array using the value of *seed*.

The *initstate*( ) and *setstate*( ) functions handle restarting and changing random-number generators. The *initstate*( ) function allows a state array, pointed to by the *state* argument, to be initialized for future use. The *size* argument, which specifies the size in bytes of the state array, shall be used by *initstate*( ) to decide what type of random-number generator to use; the larger the state array, the more random the numbers. Values for the amount of state information are 8, 32, 64, 128, and 256 bytes. Other values greater than 8 bytes are rounded down to the nearest one of these values. If *initstate*( ) is called with 8≤*size*<32, then *random*( ) shall use a simple linear congruential random number generator. The *seed* argument specifies a starting point for the random-number sequence and provides for restarting at the same point. The *initstate*( ) function shall return a pointer to the previous state information array.

If *initstate*( ) has not been called, then *random*( ) shall behave as though *initstate*( ) had been called with *seed*=1 and *size*=128.

Once a state has been initialized, *setstate*( ) allows switching between state arrays. The array defined by the *state* argument shall be used for further random-number generation until *initstate*( ) is called or *setstate*( ) is called again. The *setstate*( ) function shall return a pointer to the previous state array.

RETURN VALUE

If *initstate*( ) is called with *size* less than 8, it shall return NULL.

The *random*( ) function shall return the generated pseudo-random number.

The *srandom*( ) function shall not return a value.

Upon successful completion, *initstate*( ) and *setstate*( ) shall return a pointer to the previous state array; otherwise, a null pointer shall be returned.

38569 **ERRORS**

38570 No errors are defined.

38571 **EXAMPLES**

38572 None.

38573 **APPLICATION USAGE**

38574 After initialization, a state array can be restarted at a different point in one of two ways:

38575 1. The *initstate*( ) function can be used, with the desired seed, state array, and size of the
38576 array.

38577 2. The *setstate*( ) function, with the desired state, can be used, followed by *srandom*( ) with
38578 the desired seed. The advantage of using both of these functions is that the size of the
38579 state array does not have to be saved once it is initialized.

38580 Although some implementations of *random*( ) have written messages to standard error, such
38581 implementations do not conform to POSIX.1-2017.

38582 Issue 5 restored the historical behavior of this function.

38583 Threaded applications should use *erand48*( ), *nrand48*( ), or *jrand48*( ) instead of *random*( ) when
38584 an independent random number sequence in multiple threads is required.

38585 These functions should be avoided whenever non-trivial requirements (including safety) have to
38586 be fulfilled.

38587 **RATIONALE**

38588 None.

38589 **FUTURE DIRECTIONS**

38590 None.

38591 **SEE ALSO**

38592 *drand48*( ), *rand*( )

38593 XBD **<stdlib.h>**

38594 **CHANGE HISTORY**

38595 First released in Issue 4, Version 2.

38596 **Issue 5**

38597 Moved from X/OPEN UNIX extension to BASE.

38598 In the DESCRIPTION, the phrase ``values smaller than 8'' is replaced with ``values greater than
38599 or equal to 8, or less than 32'', ``*size*<8'' is replaced with ``8≤*size* <32'', and a new first paragraph
38600 is added to the RETURN VALUE section. A note is added to the APPLICATION USAGE
38601 indicating that these changes restore the historical behavior of the function.

38602 **Issue 6**

38603 In the DESCRIPTION, duplicate text ``For values greater than or equal to 8 . . .'' is removed.

38604 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/30 is applied, removing *rand_r*( ) from the
38605 list of suggested functions in the APPLICATION USAGE section.

38606 **Issue 7**

38607 The type of the first argument to *setstate*( ) is changed from **const char** * to **char** *.

38608 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0179 [743] is applied.

NAME

insque, remque — insert or remove an element in a queue

SYNOPSIS

XSI
```
#include <search.h>

void insque(void *element, void *pred);
void remque(void *element);
```

DESCRIPTION

The *insque*( ) and *remque*( ) functions shall manipulate queues built from doubly-linked lists. The queue can be either circular or linear. An application using *insque*( ) or *remque*( ) shall ensure it defines a structure in which the first two members of the structure are pointers to the same type of structure, and any further members are application-specific. The first member of the structure is a forward pointer to the next entry in the queue. The second member is a backward pointer to the previous entry in the queue. If the queue is linear, the queue is terminated with null pointers. The names of the structure and of the pointer members are not subject to any special restriction.

The *insque*( ) function shall insert the element pointed to by *element* into a queue immediately after the element pointed to by *pred*.

The *remque*( ) function shall remove the element pointed to by *element* from a queue.

If the queue is to be used as a linear list, invoking *insque*(&*element*, NULL), where *element* is the initial element of the queue, shall initialize the forward and backward pointers of *element* to null pointers.

If the queue is to be used as a circular list, the application shall ensure it initializes the forward pointer and the backward pointer of the initial element of the queue to the element's own address.

RETURN VALUE

The *insque*( ) and *remque*( ) functions do not return a value.

ERRORS

No errors are defined.

EXAMPLES

Creating a Linear Linked List

The following example creates a linear linked list.

```
#include <search.h>
...
struct myque element1;
struct myque element2;

char *data1 = "DATA1";
char *data2 = "DATA2";
...
element1.data = data1;
element2.data = data2;

insque (&element1, NULL);
insque (&element2, &element1);
```

38651 **Creating a Circular Linked List**

38652 The following example creates a circular linked list.

```
38653 #include <search.h>
38654 ...
38655 struct myque element1;
38656 struct myque element2;

38657 char *data1 = "DATA1";
38658 char *data2 = "DATA2";
38659 ...
38660 element1.data = data1;
38661 element2.data = data2;

38662 element1.fwd = &element1;
38663 element1.bck = &element1;

38664 insque (&element2, &element1);
```

38665 **Removing an Element**

38666 The following example removes the element pointed to by *element1*.

```
38667 #include <search.h>
38668 ...
38669 struct myque element1;
38670 ...
38671 remque (&element1);
```

38672 **APPLICATION USAGE**

38673 The historical implementations of these functions described the arguments as being of type
38674 **struct qelem *** rather than as being of type **void *** as defined here. In those implementations,
38675 **struct qelem** was commonly defined in **<search.h>** as:

```
38676 struct qelem {
38677     struct qelem  *q_forw;
38678     struct qelem  *q_back;
38679 };
```

38680 Applications using these functions, however, were never able to use this structure directly since
38681 it provided no room for the actual data contained in the elements. Most applications defined
38682 structures that contained the two pointers as the initial elements and also provided space for, or
38683 pointers to, the object's data. Applications that used these functions to update more than one
38684 type of table also had the problem of specifying two or more different structures with the same
38685 name, if they literally used **struct qelem** as specified.

38686 As described here, the implementations were actually expecting a structure type where the first
38687 two members were forward and backward pointers to structures. With C compilers that didn't
38688 provide function prototypes, applications used structures as specified in the DESCRIPTION
38689 above and the compiler did what the application expected.

38690 If this method had been carried forward with an ISO C standard compiler and the historical
38691 function prototype, most applications would have to be modified to cast pointers to the
38692 structures actually used to be pointers to **struct qelem** to avoid compilation warnings. By
38693 specifying **void *** as the argument type, applications do not need to change (unless they
38694 specifically referenced **struct qelem** and depended on it being defined in **<search.h>**).

38707 **NAME**

38708 ioctl — control a STREAMS device (**STREAMS**)

38709 **SYNOPSIS**

38710 OB XSR
```
#include <stropts.h>

int ioctl(int fildes, int request, ... /* arg */);
```

38712 **DESCRIPTION**

38713 The *ioctl*( ) function shall perform a variety of control functions on STREAMS devices. For non-
38714 STREAMS devices, the functions performed by this call are unspecified. The *request* argument
38715 and an optional third argument (with varying type) shall be passed to and interpreted by the
38716 appropriate part of the STREAM associated with *fildes*.

38717 The *fildes* argument is an open file descriptor that refers to a device.

38718 The *request* argument selects the control function to be performed and shall depend on the
38719 STREAMS device being addressed.

38720 The *arg* argument represents additional information that is needed by this specific STREAMS
38721 device to perform the requested function. The type of *arg* depends upon the particular control
38722 request, but it shall be either an integer or a pointer to a device-specific data structure.

38723 The *ioctl*( ) commands applicable to STREAMS, their arguments, and error conditions that apply
38724 to each individual command are described below.

38725 The following *ioctl*( ) commands, with error values indicated, are applicable to all STREAMS
38726 files:

38727 I_PUSH Pushes the module whose name is pointed to by *arg* onto the top of the current
38728 STREAM, just below the STREAM head. It then calls the *open*( ) function of the
38729 newly-pushed module.

38730 The *ioctl*( ) function with the I_PUSH command shall fail if:

38731 [EINVAL] Invalid module name.

38732 [ENXIO] Open function of new module failed.

38733 [ENXIO] Hangup received on *fildes*.

38734 I_POP Removes the module just below the STREAM head of the STREAM pointed to
38735 by *fildes*. The *arg* argument should be 0 in an I_POP request.

38736 The *ioctl*( ) function with the I_POP command shall fail if:

38737 [EINVAL] No module present in the STREAM.

38738 [ENXIO] Hangup received on *fildes*.

38739 I_LOOK Retrieves the name of the module just below the STREAM head of the
38740 STREAM pointed to by *fildes*, and places it in a character string pointed to by
38741 *arg*. The buffer pointed to by *arg* should be at least FMNAMESZ+1 bytes long,
38742 where FMNAMESZ is defined in **<stropts.h>**.

38743 The *ioctl*( ) function with the I_LOOK command shall fail if:

38744 [EINVAL] No module present in the STREAM.

38745 I_FLUSH Flushes read and/or write queues, depending on the value of *arg*. Valid *arg*
38746 values are:

38747 FLUSHR Flush all read queues.

38748 FLUSHW Flush all write queues.

38749 FLUSHRW Flush all read and all write queues.

38750 The *ioctl*( ) function with the I_FLUSH command shall fail if:

38751 [EINVAL] Invalid *arg* value.

38752 [EAGAIN] or [ENOSR]
38753 Unable to allocate buffers for flush message.

38754 [ENXIO] Hangup received on *fildes*.

38755 I_FLUSHBAND Flushes a particular band of messages. The *arg* argument points to a **bandinfo**
38756 structure. The *bi_flag* member may be one of FLUSHR, FLUSHW, or
38757 FLUSHRW as described above. The *bi_pri* member determines the priority
38758 band to be flushed.

38759 I_SETSIG Requests that the STREAMS implementation send the SIGPOLL signal to the
38760 calling process when a particular event has occurred on the STREAM
38761 associated with *fildes*. I_SETSIG supports an asynchronous processing
38762 capability in STREAMS. The value of *arg* is a bitmask that specifies the events
38763 for which the process should be signaled. It is the bitwise-inclusive OR of any
38764 combination of the following constants:

38765 S_RDNORM A normal (priority band set to 0) message has arrived at the
38766 head of a STREAM head read queue. A signal shall be
38767 generated even if the message is of zero length.

38768 S_RDBAND A message with a non-zero priority band has arrived at the
38769 head of a STREAM head read queue. A signal shall be
38770 generated even if the message is of zero length.

38771 S_INPUT A message, other than a high-priority message, has arrived
38772 at the head of a STREAM head read queue. A signal shall be
38773 generated even if the message is of zero length.

38774 S_HIPRI A high-priority message is present on a STREAM head read
38775 queue. A signal shall be generated even if the message is of
38776 zero length.

38777 S_OUTPUT The write queue for normal data (priority band 0) just below
38778 the STREAM head is no longer full. This notifies the process
38779 that there is room on the queue for sending (or writing)
38780 normal data downstream.

38781 S_WRNORM Equivalent to S_OUTPUT.

38782 S_WRBAND The write queue for a non-zero priority band just below the
38783 STREAM head is no longer full. This notifies the process
38784 that there is room on the queue for sending (or writing)
38785 priority data downstream.

38786 S_MSG A STREAMS signal message that contains the SIGPOLL
38787 signal has reached the front of the STREAM head read
38788 queue.

S_ERROR Notification of an error condition has reached the STREAM head.

S_HANGUP Notification of a hangup has reached the STREAM head.

S_BANDURG When used in conjunction with S_RDBAND, SIGURG is generated instead of SIGPOLL when a priority message reaches the front of the STREAM head read queue.

If *arg* is 0, the calling process shall be unregistered and shall not receive further SIGPOLL signals for the stream associated with *fildes*.

Processes that wish to receive SIGPOLL signals shall ensure that they explicitly register to receive them using I_SETSIG. If several processes register to receive this signal for the same event on the same STREAM, each process shall be signaled when the event occurs.

The *ioctl*( ) function with the I_SETSIG command shall fail if:

[EINVAL] The value of *arg* is invalid.

[EINVAL] The value of *arg* is 0 and the calling process is not registered to receive the SIGPOLL signal.

[EAGAIN] There were insufficient resources to store the signal request.

I_GETSIG Returns the events for which the calling process is currently registered to be sent a SIGPOLL signal. The events are returned as a bitmask in an **int** pointed to by *arg*, where the events are those specified in the description of I_SETSIG above.

The *ioctl*( ) function with the I_GETSIG command shall fail if:

[EINVAL] Process is not registered to receive the SIGPOLL signal.

I_FIND Compares the names of all modules currently present in the STREAM to the name pointed to by *arg*, and returns 1 if the named module is present in the STREAM, or returns 0 if the named module is not present.

The *ioctl*( ) function with the I_FIND command shall fail if:

[EINVAL] *arg* does not contain a valid module name.

I_PEEK Retrieves the information in the first message on the STREAM head read queue without taking the message off the queue. It is analogous to *getmsg*( ) except that this command does not remove the message from the queue. The *arg* argument points to a **strpeek** structure.

The application shall ensure that the *maxlen* member in the **ctlbuf** and **databuf** **strbuf** structures is set to the number of bytes of control information and/or data information, respectively, to retrieve. The *flags* member may be marked RS_HIPRI or 0, as described by *getmsg*( ). If the process sets *flags* to RS_HIPRI, for example, I_PEEK shall only look for a high-priority message on the STREAM head read queue.

I_PEEK returns 1 if a message was retrieved, and returns 0 if no message was found on the STREAM head read queue, or if the RS_HIPRI flag was set in *flags* and a high-priority message was not present on the STREAM head read queue. It does not wait for a message to arrive. On return, **ctlbuf** specifies information in the control buffer, **databuf** specifies information in the data

buffer, and *flags* contains the value RS_HIPRI or 0.

I_SRDOPT Sets the read mode using the value of the argument *arg*. Read modes are described in *read*( ). Valid *arg* flags are:

RNORM Byte-stream mode, the default.

RMSGD Message-discard mode.

RMSGN Message-nondiscard mode.

The bitwise-inclusive OR of RMSGD and RMSGN shall return [EINVAL]. The bitwise-inclusive OR of RNORM and either RMSGD or RMSGN shall result in the other flag overriding RNORM which is the default.

In addition, treatment of control messages by the STREAM head may be changed by setting any of the following flags in *arg*:

RPROTNORM Fail *read*( ) with [EBADMSG] if a message containing a control part is at the front of the STREAM head read queue.

RPROTDAT Deliver the control part of a message as data when a process issues a *read*( ).

RPROTDIS Discard the control part of a message, delivering any data portion, when a process issues a *read*( ).

The *ioctl*( ) function with the I_SRDOPT command shall fail if:

[EINVAL] The *arg* argument is not valid.

I_GRDOPT Returns the current read mode setting, as described above, in an **int** pointed to by the argument *arg*. Read modes are described in *read*( ).

I_NREAD Counts the number of data bytes in the data part of the first message on the STREAM head read queue and places this value in the **int** pointed to by *arg*. The return value for the command shall be the number of messages on the STREAM head read queue. For example, if 0 is returned in *arg*, but the *ioctl*( ) return value is greater than 0, this indicates that a zero-length message is next on the queue.

I_FDINSERT Creates a message from specified buffer(s), adds information about another STREAM, and sends the message downstream. The message contains a control part and an optional data part. The data and control parts to be sent are distinguished by placement in separate buffers, as described below. The *arg* argument points to a **strfdinsert** structure.

The application shall ensure that the *len* member in the **ctlbuf strbuf** structure is set to the size of a **t_uscalar_t** plus the number of bytes of control information to be sent with the message. The *fildes* member specifies the file descriptor of the other STREAM, and the *offset* member, which must be suitably aligned for use as a **t_uscalar_t**, specifies the offset from the start of the control buffer where I_FDINSERT shall store a **t_uscalar_t** whose interpretation is specific to the STREAM end. The application shall ensure that the *len* member in the **databuf strbuf** structure is set to the number of bytes of data information to be sent with the message, or to 0 if no data part is to be sent.

The *flags* member specifies the type of message to be created. A normal message is created if *flags* is set to 0, and a high-priority message is created if

flags is set to RS_HIPRI. For non-priority messages, I_FDINSERT shall block if the STREAM write queue is full due to internal flow control conditions. For priority messages, I_FDINSERT does not block on this condition. For non-priority messages, I_FDINSERT does not block when the write queue is full and O_NONBLOCK is set. Instead, it fails and sets *errno* to [EAGAIN].

I_FDINSERT also blocks, unless prevented by lack of internal resources, waiting for the availability of message blocks in the STREAM, regardless of priority or whether O_NONBLOCK has been specified. No partial message is sent.

The *ioctl*( ) function with the I_FDINSERT command shall fail if:

[EAGAIN] A non-priority message is specified, the O_NONBLOCK flag is set, and the STREAM write queue is full due to internal flow control conditions.

[EAGAIN] or [ENOSR]
Buffers cannot be allocated for the message that is to be created.

[EINVAL] One of the following:

- The *fildes* member of the **strfdinsert** structure is not a valid, open STREAM file descriptor.
- The size of a **t_uscalar_t** plus *offset* is greater than the *len* member for the buffer specified through **ctlbuf**.
- The *offset* member does not specify a properly-aligned location in the data buffer.
- An undefined value is stored in *flags*.

[ENXIO] Hangup received on the STREAM identified by either the *fildes* argument or the *fildes* member of the **strfdinsert** structure.

[ERANGE] The *len* member for the buffer specified through **databuf** does not fall within the range specified by the maximum and minimum packet sizes of the topmost STREAM module; or the *len* member for the buffer specified through **databuf** is larger than the maximum configured size of the data part of a message; or the *len* member for the buffer specified through **ctlbuf** is larger than the maximum configured size of the control part of a message.

I_STR Constructs an internal STREAMS *ioctl*( ) message from the data pointed to by *arg*, and sends that message downstream.

This mechanism is provided to send *ioctl*( ) requests to downstream modules and drivers. It allows information to be sent with *ioctl*( ), and returns to the process any information sent upstream by the downstream recipient. I_STR shall block until the system responds with either a positive or negative acknowledgement message, or until the request times out after some period of time. If the request times out, it shall fail with *errno* set to [ETIME].

At most, one I_STR can be active on a STREAM. Further I_STR calls shall block until the active I_STR completes at the STREAM head. The default

timeout interval for these requests is 15 seconds. The O_NONBLOCK flag has no effect on this call.

To send requests downstream, the application shall ensure that *arg* points to a **strioctl** structure.

The *ic_cmd* member is the internal *ioctl*( ) command intended for a downstream module or driver and *ic_timout* is the number of seconds (−1=infinite, 0=use implementation-defined timeout interval, >0=as specified) an I_STR request shall wait for acknowledgement before timing out. *ic_len* is the number of bytes in the data argument, and *ic_dp* is a pointer to the data argument. The *ic_len* member has two uses: on input, it contains the length of the data argument passed in, and on return from the command, it contains the number of bytes being returned to the process (the buffer pointed to by *ic_dp* should be large enough to contain the maximum amount of data that any module or the driver in the STREAM can return).

The STREAM head shall convert the information pointed to by the **strioctl** structure to an internal *ioctl*( ) command message and send it downstream.

The *ioctl*( ) function with the I_STR command shall fail if:

[EAGAIN] or [ENOSR]
: Unable to allocate buffers for the *ioctl*( ) message.

[EINVAL]
: The *ic_len* member is less than 0 or larger than the maximum configured size of the data part of a message, or *ic_timout* is less than −1.

[ENXIO]
: Hangup received on *fildes*.

[ETIME]
: A downstream *ioctl*( ) timed out before acknowledgement was received.

An I_STR can also fail while waiting for an acknowledgement if a message indicating an error or a hangup is received at the STREAM head. In addition, an error code can be returned in the positive or negative acknowledgement message, in the event the *ioctl*( ) command sent downstream fails. For these cases, I_STR shall fail with *errno* set to the value in the message.

I_SWROPT
: Sets the write mode using the value of the argument *arg*. Valid bit settings for *arg* are:

  SNDZERO
  : Send a zero-length message downstream when a *write*( ) of 0 bytes occurs. To not send a zero-length message when a *write*( ) of 0 bytes occurs, the application shall ensure that this bit is not set in *arg* (for example, *arg* would be set to 0).

  The *ioctl*( ) function with the I_SWROPT command shall fail if:

  [EINVAL]
  : *arg* is not the above value.

I_GWROPT
: Returns the current write mode setting, as described above, in the **int** that is pointed to by the argument *arg*.

I_SENDFD
: Creates a new reference to the open file description associated with the file descriptor *arg*, and writes a message on the STREAMS-based pipe *fildes* containing this reference, together with the user ID and group ID of the calling process.

The *ioctl*( ) function with the I_SENDFD command shall fail if:

[EAGAIN] The sending STREAM is unable to allocate a message block to contain the file pointer; or the read queue of the receiving STREAM head is full and cannot accept the message sent by I_SENDFD.

[EBADF] The *arg* argument is not a valid, open file descriptor.

[EINVAL] The *fildes* argument is not connected to a STREAM pipe.

[ENXIO] Hangup received on *fildes*.

The *ioctl*( ) function with the I_SENDFD command may fail if:

[EINVAL] The *arg* argument is equal to the *fildes* argument.

I_RECVFD Retrieves the reference to an open file description from a message written to a STREAMS-based pipe using the I_SENDFD command, and allocates a new file descriptor in the calling process that refers to this open file description. The *arg* argument is a pointer to a **strrecvfd** data structure as defined in **<stropts.h>**.

The *fd* member is a file descriptor. The *uid* and *gid* members are the effective user ID and effective group ID, respectively, of the sending process.

If O_NONBLOCK is not set, I_RECVFD shall block until a message is present at the STREAM head. If O_NONBLOCK is set, I_RECVFD shall fail with *errno* set to [EAGAIN] if no message is present at the STREAM head.

If the message at the STREAM head is a message sent by an I_SENDFD, a new file descriptor shall be allocated for the open file descriptor referenced in the message. The new file descriptor is placed in the *fd* member of the **strrecvfd** structure pointed to by *arg*.

The *ioctl*( ) function with the I_RECVFD command shall fail if:

[EAGAIN] A message is not present at the STREAM head read queue and the O_NONBLOCK flag is set.

[EBADMSG] The message at the STREAM head read queue is not a message containing a passed file descriptor.

[EMFILE] All file descriptors available to the process are currently open.

[ENXIO] Hangup received on *fildes*.

I_LIST Allows the process to list all the module names on the STREAM, up to and including the topmost driver name. If *arg* is a null pointer, the return value shall be the number of modules, including the driver, that are on the STREAM pointed to by *fildes*. This lets the process allocate enough space for the module names. Otherwise, it should point to a **str_list** structure.

The *sl_nmods* member indicates the number of entries the process has allocated in the array. Upon return, the *sl_modlist* member of the **str_list** structure shall contain the list of module names, and the number of entries that have been filled into the *sl_modlist* array is found in the *sl_nmods* member (the number includes the number of modules including the driver). The return value from *ioctl*( ) shall be 0. The entries are filled in starting at the top of the

39008 STREAM and continuing downstream until either the end of the STREAM is
39009 reached, or the number of requested modules (*sl_nmods*) is satisfied.

39010 The *ioctl*( ) function with the I_LIST command shall fail if:

39011 [EINVAL] The *sl_nmods* member is less than 1.

39012 [EAGAIN] or [ENOSR]
39013 Unable to allocate buffers.

39014 I_ATMARK Allows the process to see if the message at the head of the STREAM head read
39015 queue is marked by some module downstream. The *arg* argument determines
39016 how the checking is done when there may be multiple marked messages on
39017 the STREAM head read queue. It may take on the following values:

39018 ANYMARK Check if the message is marked.

39019 LASTMARK Check if the message is the last one marked on the queue.

39020 The bitwise-inclusive OR of the flags ANYMARK and LASTMARK is
39021 permitted.

39022 The return value shall be 1 if the mark condition is satisfied; otherwise, the
39023 value shall be 0.

39024 The *ioctl*( ) function with the I_ATMARK command shall fail if:

39025 [EINVAL] Invalid *arg* value.

39026 I_CKBAND Checks if the message of a given priority band exists on the STREAM head
39027 read queue. This shall return 1 if a message of the given priority exists, 0 if no
39028 such message exists, or –1 on error. *arg* should be of type **int**.

39029 The *ioctl*( ) function with the I_CKBAND command shall fail if:

39030 [EINVAL] Invalid *arg* value.

39031 I_GETBAND Returns the priority band of the first message on the STREAM head read
39032 queue in the integer referenced by *arg*.

39033 The *ioctl*( ) function with the I_GETBAND command shall fail if:

39034 [ENODATA] No message on the STREAM head read queue.

39035 I_CANPUT Checks if a certain band is writable. *arg* is set to the priority band in question.
39036 The return value shall be 0 if the band is flow-controlled, 1 if the band is
39037 writable, or –1 on error.

39038 The *ioctl*( ) function with the I_CANPUT command shall fail if:

39039 [EINVAL] Invalid *arg* value.

39040 I_SETCLTIME This request allows the process to set the time the STREAM head shall delay
39041 when a STREAM is closing and there is data on the write queues. Before
39042 closing each module or driver, if there is data on its write queue, the STREAM
39043 head shall delay for the specified amount of time to allow the data to drain. If,
39044 after the delay, data is still present, it shall be flushed. The *arg* argument is a
39045 pointer to an integer specifying the number of milliseconds to delay, rounded
39046 up to the nearest valid value. If I_SETCLTIME is not performed on a STREAM,
39047 an implementation-defined default timeout interval is used.

The *ioctl*( ) function with the I_SETCLTIME command shall fail if:

[EINVAL] Invalid *arg* value.

I_GETCLTIME Returns the close time delay in the integer pointed to by *arg*.

Multiplexed STREAMS Configurations

The following commands are used for connecting and disconnecting multiplexed STREAMS configurations. These commands use an implementation-defined default timeout interval.

I_LINK Connects two STREAMs, where *fildes* is the file descriptor of the STREAM connected to the multiplexing driver, and *arg* is the file descriptor of the STREAM connected to another driver. The STREAM designated by *arg* is connected below the multiplexing driver. I_LINK requires the multiplexing driver to send an acknowledgement message to the STREAM head regarding the connection. This call shall return a multiplexer ID number (an identifier used to disconnect the multiplexer; see I_UNLINK) on success, and −1 on failure.

The *ioctl*( ) function with the I_LINK command shall fail if:

[ENXIO] Hangup received on *fildes*.

[ETIME] Timeout before acknowledgement message was received at STREAM head.

[EAGAIN] or [ENOSR]
Unable to allocate STREAMS storage to perform the I_LINK.

[EBADF] The *arg* argument is not a valid, open file descriptor.

[EINVAL] The *fildes* argument does not support multiplexing; or *arg* is not a STREAM or is already connected downstream from a multiplexer; or the specified I_LINK operation would connect the STREAM head in more than one place in the multiplexed STREAM.

An I_LINK can also fail while waiting for the multiplexing driver to acknowledge the request, if a message indicating an error or a hangup is received at the STREAM head of *fildes*. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_LINK fails with *errno* set to the value in the message.

I_UNLINK Disconnects the two STREAMs specified by *fildes* and *arg*. *fildes* is the file descriptor of the STREAM connected to the multiplexing driver. The *arg* argument is the multiplexer ID number that was returned by the I_LINK *ioctl*( ) command when a STREAM was connected downstream from the multiplexing driver. If *arg* is MUXID_ALL, then all STREAMs that were connected to *fildes* shall be disconnected. As in I_LINK, this command requires acknowledgement.

The *ioctl*( ) function with the I_UNLINK command shall fail if:

[ENXIO] Hangup received on *fildes*.

[ETIME] Timeout before acknowledgement message was received at STREAM head.

[EAGAIN] or [ENOSR]
Unable to allocate buffers for the acknowledgement message.

[EINVAL] Invalid multiplexer ID number.

An I_UNLINK can also fail while waiting for the multiplexing driver to acknowledge the request if a message indicating an error or a hangup is received at the STREAM head of *fildes*. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_UNLINK shall fail with *errno* set to the value in the message.

I_PLINK Creates a *persistent connection* between two STREAMs, where *fildes* is the file descriptor of the STREAM connected to the multiplexing driver, and *arg* is the file descriptor of the STREAM connected to another driver. This call shall create a persistent connection which can exist even if the file descriptor *fildes* associated with the upper STREAM to the multiplexing driver is closed. The STREAM designated by *arg* gets connected via a persistent connection below the multiplexing driver. I_PLINK requires the multiplexing driver to send an acknowledgement message to the STREAM head. This call shall return a multiplexer ID number (an identifier that may be used to disconnect the multiplexer; see I_PUNLINK) on success, and –1 on failure.

The *ioctl*( ) function with the I_PLINK command shall fail if:

[ENXIO] Hangup received on *fildes*.

[ETIME] Timeout before acknowledgement message was received at STREAM head.

[EAGAIN] or [ENOSR]
Unable to allocate STREAMS storage to perform the I_PLINK.

[EBADF] The *arg* argument is not a valid, open file descriptor.

[EINVAL] The *fildes* argument does not support multiplexing; or *arg* is not a STREAM or is already connected downstream from a multiplexer; or the specified I_PLINK operation would connect the STREAM head in more than one place in the multiplexed STREAM.

An I_PLINK can also fail while waiting for the multiplexing driver to acknowledge the request, if a message indicating an error or a hangup is received at the STREAM head of *fildes*. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_PLINK shall fail with *errno* set to the value in the message.

I_PUNLINK Disconnects the two STREAMs specified by *fildes* and *arg* from a persistent connection. The *fildes* argument is the file descriptor of the STREAM connected to the multiplexing driver. The *arg* argument is the multiplexer ID number that was returned by the I_PLINK *ioctl*( ) command when a STREAM was connected downstream from the multiplexing driver. If *arg* is MUXID_ALL, then all STREAMs which are persistent connections to *fildes* shall be disconnected. As in I_PLINK, this command requires the multiplexing

39135 driver to acknowledge the request.

39136 The *ioctl*( ) function with the I_PUNLINK command shall fail if:

39137 [ENXIO] Hangup received on *fildes*.

39138 [ETIME] Timeout before acknowledgement message was received at
39139 STREAM head.

39140 [EAGAIN] or [ENOSR]
39141 Unable to allocate buffers for the acknowledgement
39142 message.

39143 [EINVAL] Invalid multiplexer ID number.

39144 An I_PUNLINK can also fail while waiting for the multiplexing driver to
39145 acknowledge the request if a message indicating an error or a hangup is
39146 received at the STREAM head of *fildes*. In addition, an error code can be
39147 returned in the positive or negative acknowledgement message. For these
39148 cases, I_PUNLINK shall fail with *errno* set to the value in the message.

39149 **RETURN VALUE**

39150 Upon successful completion, *ioctl*( ) shall return a value other than −1 that depends upon the
39151 STREAMS device control function. Otherwise, it shall return −1 and set *errno* to indicate the
39152 error.

39153 **ERRORS**

39154 Under the following general conditions, *ioctl*( ) shall fail if:

39155 [EBADF] The *fildes* argument is not a valid open file descriptor.

39156 [EINTR] A signal was caught during the *ioctl*( ) operation.

39157 [EINVAL] The STREAM or multiplexer referenced by *fildes* is linked (directly or
39158 indirectly) downstream from a multiplexer.

39159 If an underlying device driver detects an error, then *ioctl*( ) shall fail if:

39160 [EINVAL] The *request* or *arg* argument is not valid for this device.

39161 [EIO] Some physical I/O error has occurred.

39162 [ENOTTY] The file associated with the *fildes* argument is not a STREAMS device that
39163 accepts control functions.

39164 [ENXIO] The *request* and *arg* arguments are valid for this device driver, but the service
39165 requested cannot be performed on this particular sub-device.

39166 [ENODEV] The *fildes* argument refers to a valid STREAMS device, but the corresponding
39167 device driver does not support the *ioctl*( ) function.

39168 If a STREAM is connected downstream from a multiplexer, any *ioctl*( ) command except
39169 I_UNLINK and I_PUNLINK shall set *errno* to [EINVAL].

EXAMPLES

None.

APPLICATION USAGE

The implementation-defined timeout interval for STREAMS has historically been 15 seconds.

RATIONALE

None.

FUTURE DIRECTIONS

The *ioctl*( ) function may be removed in a future version.

XBD **<stropts.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The Open Group Corrigendum U028/4 is applied, correcting text in the I_FDINSERT [EINVAL] case to refer to *ctlbuf*.

This function is marked as part of the XSI STREAMS Option Group.

The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #155 is applied, adding a ``may fail'' [EINVAL] error condition for the I_SENDFD command.

SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

The *ioctl*( ) function is marked obsolescent.

NAME

isalnum, isalnum_l ‡'test for an alphanumeric character

SYNOPSIS

```
#include <ctype.h>

int isalnum(int c);
CX int isalnum_l(int c, locale_t locale);
```

DESCRIPTION

CX For *isalnum*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

CX The *isalnum*( ) and *isalnum_l*( ) functions shall test whether *c* is a character of class **alpha** or CX **digit** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is an **int**, the value of which the application shall ensure is representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

CX The behavior is undefined if the *locale* argument to *isalnum_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

CX The *isalnum*( ) and *isalnum_l*( ) functions shall return non-zero if *c* is an alphanumeric character; otherwise, they shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

39237 **Issue 7**

39238 The *isalnum_l*( ) function is added from The Open Group Technical Standard, 2006, Extended
39239 API Set Part 4.

39240 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0274 [302], XSH/TC1-2008/0275 [283],
39241 and XSH/TC1-2008/0276 [283] are applied.

NAME

isalpha, isalpha_l ‡'test for an alphabetic character

SYNOPSIS

```
#include <ctype.h>

int isalpha(int c);
CX int isalpha_l(int c, locale_t locale);
```

DESCRIPTION

CX For *isalpha*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

CX The *isalpha*( ) and *isalpha_l*( ) functions shall test whether *c* is a character of class **alpha** in the CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is an **int**, the value of which the application shall ensure is representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

CX The behavior is undefined if the *locale* argument to *isalpha_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

CX The *isalpha*( ) and *isalpha_l*( ) functions shall return non-zero if *c* is an alphabetic character; otherwise, they shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

The *isalpha_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0277 [302], XSH/TC1-2008/0278 [283], and XSH/TC1-2008/0279 [283] are applied.

NAME

isascii ‡'test for a 7-bit US-ASCII character

SYNOPSIS

OB XSI

```
#include <ctype.h>

int isascii(int c);
```

DESCRIPTION

The *isascii*( ) function shall test whether *c* is a 7-bit US-ASCII character code.

The *isascii*( ) function is defined on all integer values.

RETURN VALUE

The *isascii*( ) function shall return non-zero if *c* is a 7-bit US-ASCII character code between 0 and octal 0177 inclusive; otherwise, it shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *isascii*( ) function cannot be used portably in a localized application.

RATIONALE

None.

FUTURE DIRECTIONS

The *isascii*( ) function may be removed in a future version.

SEE ALSO

XBD **<ctype.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 7

The *isascii*( ) function is marked obsolescent.

NAME

isastream — test a file descriptor (**STREAMS**)

SYNOPSIS

OB XSR
```
#include <stropts.h>

int isastream(int fildes);
```

DESCRIPTION

The *isastream*( ) function shall test whether *fildes*, an open file descriptor, is associated with a STREAMS-based file.

RETURN VALUE

Upon successful completion, *isastream*( ) shall return 1 if *fildes* refers to a STREAMS-based file and 0 if not. Otherwise, *isastream*( ) shall return –1 and set *errno* to indicate the error.

ERRORS

The *isastream*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid open file descriptor.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *isastream*( ) function may be removed in a future version.

SEE ALSO

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 7

The *isastream*( ) function is marked obsolescent.

39345 **NAME**

39346 isatty ‡’test for a terminal device

39347 **SYNOPSIS**

39348 `#include <unistd.h>`

39349 `int isatty(int fildes);`

39350 **DESCRIPTION**

39351 The *isatty*( ) function shall test whether *fildes*, an open file descriptor, is associated with a
39352 terminal device.

39353 **RETURN VALUE**

39354 The *isatty*( ) function shall return 1 if *fildes* is associated with a terminal; otherwise, it shall return
39355 0 and may set *errno* to indicate the error.

39356 **ERRORS**

39357 The *isatty*( ) function may fail if:

39358 [EBADF] The *fildes* argument is not a valid open file descriptor.

39359 [ENOTTY] The file associated with the *fildes* argument is not a terminal.

39360 **EXAMPLES**

39361 None.

39362 **APPLICATION USAGE**

39363 The *isatty*( ) function does not necessarily indicate that a human being is available for interaction
39364 via *fildes*. It is quite possible that non-terminal devices are connected to the communications
39365 line.

39366 **RATIONALE**

39367 None.

39368 **FUTURE DIRECTIONS**

39369 None.

39370 **SEE ALSO**

39371 XBD **<unistd.h>**

39372 **CHANGE HISTORY**

39373 First released in Issue 1. Derived from Issue 1 of the SVID.

39374 **Issue 6**

39375 The following new requirements on POSIX implementations derive from alignment with the
39376 Single UNIX Specification:

39377 The optional setting of *errno* to indicate an error is added.

39378 The [EBADF] and [ENOTTY] optional error conditions are added.

39379 **Issue 7**

39380 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

NAME

isblank, isblank_l ‡'test for a blank character

SYNOPSIS

```
#include <ctype.h>

int isblank(int c);
CX int isblank_l(int c, locale_t locale);
```

DESCRIPTION

CX For *isblank*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

CX The *isblank*( ) and *isblank_l*( ) functions shall test whether *c* is a character of class **blank** in the CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is a type **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

CX The behavior is undefined if the *locale* argument to *isblank_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

CX The *isblank*( ) and *isblank_l*( ) functions shall return non-zero if *c* is a <blank>; otherwise, they shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Chapter 7 (on page 135), **<ctype.h>**, **<locale.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

Issue 7

The *isblank_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

39423 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0280 [302], XSH/TC1-2008/0281 [283],
39424 and XSH/TC1-2008/0282 [283] are applied.

NAME

iscntrl, iscntrl_l — test for a control character

SYNOPSIS

```
#include <ctype.h>

int iscntrl(int c);
CX int iscntrl_l(int c, locale_t locale);
```

DESCRIPTION

CX For *iscntrl*(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

CX The *iscntrl*() and *iscntrl_l*() functions shall test whether *c* is a character of class **cntrl** in the CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is a type **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

CX The behavior is undefined if the *locale* argument to *iscntrl_l*() is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

CX The *iscntrl*() and *iscntrl_l*() functions shall return non-zero if *c* is a control character; otherwise, they shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

The *iscntrl_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0283 [302], XSH/TC1-2008/0284 [283], and XSH/TC1-2008/0285 [283] are applied.

39471 **NAME**

39472 isdigit, isdigit_l ‡'test for a decimal digit

39473 **SYNOPSIS**

39474
```
#include <ctype.h>
```

39475
```
int isdigit(int c);
```

39476 CX
```
int isdigit_l(int c, locale_t locale);
```

39477 **DESCRIPTION**

39478 CX For *isdigit*(): The functionality described on this reference page is aligned with the ISO C
39479 standard. Any conflict between the requirements described here and the ISO C standard is
39480 unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

39481 CX The *isdigit*() and *isdigit_l*() functions shall test whether *c* is a character of class **digit** in the
39482 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page
39483 135).

39484 The *c* argument is an **int**, the value of which the application shall ensure is a character
39485 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
39486 any other value, the behavior is undefined.

39487 CX The behavior is undefined if the *locale* argument to *isdigit_l*() is the special locale object
39488 LC_GLOBAL_LOCALE or is not a valid locale object handle.

39489 **RETURN VALUE**

39490 CX The *isdigit*() and *isdigit_l*() functions shall return non-zero if *c* is a decimal digit; otherwise,
39491 they shall return 0.

39492 **ERRORS**

39493 No errors are defined.

39494 **EXAMPLES**

39495 None.

39496 **APPLICATION USAGE**

39497 To ensure applications portability, especially across natural languages, only these functions and
39498 the functions in the reference pages listed in the SEE ALSO section should be used for character
39499 classification.

The *isdigit_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0286 [302], XSH/TC1-2008/0287 [283], and XSH/TC1-2008/0288 [283] are applied.

NAME

isfinite ‡'test for finite value

SYNOPSIS

```
#include <math.h>

int isfinite(real-floating x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *isfinite*( ) macro shall determine whether its argument has a finite value (zero, subnormal, or normal, and not infinite or NaN). First, an argument represented in a format wider than its semantic type is converted to its semantic type. Then determination is based on the type of the argument.

RETURN VALUE

The *isfinite*( ) macro shall return a non-zero value if and only if its argument has a finite value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

39547 **NAME**

39548 isgraph, isgraph_l ‡'test for a visible character

39549 **SYNOPSIS**

39550 `#include <ctype.h>`

39551 `int isgraph(int c);`

39552 CX `int isgraph_l(int c, locale_t locale);`

39553 **DESCRIPTION**

39554 CX For *isgraph*( ): The functionality described on this reference page is aligned with the ISO C
39555 standard. Any conflict between the requirements described here and the ISO C standard is
39556 unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

39557 CX The *isgraph*( ) and *isgraph_l*( ) functions shall test whether *c* is a character of class **graph** in the
39558 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page
39559 135).

39560 The *c* argument is an **int**, the value of which the application shall ensure is a character
39561 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
39562 any other value, the behavior is undefined.

39563 CX The behavior is undefined if the *locale* argument to *isgraph_l*( ) is the special locale object
39564 LC_GLOBAL_LOCALE or is not a valid locale object handle.

39565 **RETURN VALUE**

39566 CX The *isgraph*( ) and *isgraph_l*( ) functions shall return non-zero if *c* is a character with a visible
39567 representation; otherwise, they shall return 0.

39568 **ERRORS**

39569 No errors are defined.

39570 **EXAMPLES**

39571 None.

39572 **APPLICATION USAGE**

39573 To ensure applications portability, especially across natural languages, only these functions and
39574 the functions in the reference pages listed in the SEE ALSO section should be used for character
39575 classification.

39587 The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

The *isgraph_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0289 [302], XSH/TC1-2008/0290 [283], and XSH/TC1-2008/0291 [283] are applied.

NAME

isgreater — test if x greater than y

SYNOPSIS

```
#include <math.h>

int isgreater(real-floating x, real-floating y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *isgreater*( ) macro shall determine whether its first argument is greater than its second argument. The value of *isgreater*(*x*, *y*) shall be equal to (*x*) > (*y*); however, unlike (*x*) > (*y*), *isgreater*(*x*, *y*) shall not raise the invalid floating-point exception when *x* and *y* are unordered.

RETURN VALUE

Upon successful completion, the *isgreater*( ) macro shall return the value of (*x*) > (*y*).

If *x* or *y* is NaN, 0 shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The relational and equality operators support the usual mathematical relationships between numeric values. For any ordered pair of numeric values, exactly one of the relationships (less, greater, and equal) is true. Relational operators may raise the invalid floating-point exception when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the unordered relationship is true. This macro is a quiet (non-floating-point exception raising) version of a relational operator. It facilitates writing efficient code that accounts for NaNs without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating** indicates that the argument shall be an expression of **real-floating** type.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

isgreaterequal( ), *isless*( ), *islessequal*( ), *islessgreater*( ), *isunordered*( )

XBD **<math.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

isgreaterequal — test if x is greater than or equal to y

SYNOPSIS

```
#include <math.h>

int isgreaterequal(real-floating x, real-floating y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *isgreaterequal*( ) macro shall determine whether its first argument is greater than or equal to its second argument. The value of *isgreaterequal*(x, y) shall be equal to $(x) \geq (y)$; however, unlike $(x) \geq (y)$, *isgreaterequal*(x, y) shall not raise the invalid floating-point exception when x and y are unordered.

RETURN VALUE

Upon successful completion, the *isgreaterequal*( ) macro shall return the value of $(x) \geq (y)$.

If x or y is NaN, 0 shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The relational and equality operators support the usual mathematical relationships between numeric values. For any ordered pair of numeric values, exactly one of the relationships (less, greater, and equal) is true. Relational operators may raise the invalid floating-point exception when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the unordered relationship is true. This macro is a quiet (non-floating-point exception raising) version of a relational operator. It facilitates writing efficient code that accounts for NaNs without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating** indicates that the argument shall be an expression of **real-floating** type.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

isinf ‡'test for infinity

SYNOPSIS

```
#include <math.h>

int isinf(real-floating x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *isinf*( ) macro shall determine whether its argument value is an infinity (positive or negative). First, an argument represented in a format wider than its semantic type is converted to its semantic type. Then determination is based on the type of the argument.

RETURN VALUE

The *isinf*( ) macro shall return a non-zero value if and only if its argument has an infinite value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

XBD **<math.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

isless ‡'test if x is less than y

SYNOPSIS

```
#include <math.h>

int isless(real-floating x, real-floating y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *isless*( ) macro shall determine whether its first argument is less than its second argument. The value of *isless*(*x*, *y*) shall be equal to (*x*) < (*y*); however, unlike (*x*) < (*y*), *isless*(*x*, *y*) shall not raise the invalid floating-point exception when *x* and *y* are unordered.

RETURN VALUE

Upon successful completion, the *isless*( ) macro shall return the value of (*x*) < (*y*).

If *x* or *y* is NaN, 0 shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The relational and equality operators support the usual mathematical relationships between numeric values. For any ordered pair of numeric values, exactly one of the relationships (less, greater, and equal) is true. Relational operators may raise the invalid floating-point exception when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the unordered relationship is true. This macro is a quiet (non-floating-point exception raising) version of a relational operator. It facilitates writing efficient code that accounts for NaNs without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating** indicates that the argument shall be an expression of **real-floating** type.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<math.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

islessequal ‡'test if x is less than or equal to y

SYNOPSIS

```
#include <math.h>

int islessequal(real-floating x, real-floating y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *islessequal*( ) macro shall determine whether its first argument is less than or equal to its second argument. The value of *islessequal*(*x*, *y*) shall be equal to (*x*) <= (*y*); however, unlike (*x*) <= (*y*), *islessequal*(*x*, *y*) shall not raise the invalid floating-point exception when *x* and *y* are unordered.

RETURN VALUE

Upon successful completion, the *islessequal*( ) macro shall return the value of (*x*) <= (*y*).

If *x* or *y* is NaN, 0 shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The relational and equality operators support the usual mathematical relationships between numeric values. For any ordered pair of numeric values, exactly one of the relationships (less, greater, and equal) is true. Relational operators may raise the invalid floating-point exception when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the unordered relationship is true. This macro is a quiet (non-floating-point exception raising) version of a relational operator. NAME

islessgreater — test if x is less than or greater than y

SYNOPSIS

```
#include <math.h>

int islessgreater(real-floating x, real-floating y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *islessgreater*( ) macro shall determine whether its first argument is less than or greater than its second argument. The *islessgreater*(*x*, *y*) macro is similar to (*x*) < (*y*) || (*x*) > (*y*); however, *islessgreater*(*x*, *y*) shall not raise the invalid floating-point exception when *x* and *y* are unordered (nor shall it evaluate *x* and *y* twice).

RETURN VALUE

Upon successful completion, the *islessgreater*( ) macro shall return the value of (*x*) < (*y*) || (*x*) > (*y*).

If *x* or *y* is NaN, 0 shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The relational and equality operators support the usual mathematical relationships between numeric values. For any ordered pair of numeric values, exactly one of the relationships (less, greater, and equal) is true. Relational operators may raise the invalid floating-point exception when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the unordered relationship is true. NAME

islower, islower_l — test for a lowercase letter

SYNOPSIS

```
#include <ctype.h>

int islower(int c);
CX int islower_l(int c, locale_t locale);
```

DESCRIPTION

CX For *islower*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

CX The *islower*( ) and *islower_l*( ) functions shall test whether *c* is a character of class **lower** in the CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

CX The behavior is undefined if the *locale* argument to *islower_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

CX The *islower*( ) and *islower_l*( ) functions shall return non-zero if *c* is a lowercase letter; otherwise, they shall return 0.

ERRORS

No errors are defined.

EXAMPLES

Testing for a Lowercase Letter

Two examples follow, the first using *islower*( ), the second using multiple concurrent locales and *islower_l*( ).

The examples test whether the value is a lowercase letter, based on the current locale, then use it as part of a key value.

```
/* Example 1 -- using islower() */
#include <ctype.h>
#include <stdlib.h>
#include <locale.h>
...
char *keystr;
int elementlen, len;
unsigned char c;
...
setlocale(LC_ALL, "");
...
len = 0;
while (len < elementlen) {
    c = (unsigned char) (rand() % 256);
...
```

```
            if (islower(c))
                keystr[len++] = c;
            }
        ...
        /* Example 2 -- using islower_l() */
        #include <ctype.h>
        #include <stdlib.h>
        #include <locale.h>
        ...
        char *keystr;
        int elementlen, len;
        unsigned char c;
        ...
        locale_t loc = newlocale (LC_ALL_MASK, "", (locale_t) 0);
        ...
        len = 0;
        while (len < elementlen) {
            c = (unsigned char) (rand() % 256);
        ...
            if (islower_l(c, loc))
                keystr[len++] = c;
            }
        ...
```

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements and an example is added.

Issue 7

The *islower_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

39898 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0292 [302], XSH/TC1-2008/0293 [283],
39899 XSH/TC1-2008/0294 [283], XSH/TC1-2008/0295 [302], and XSH/TC1-2008/0296 [304] are
39900 applied.

NAME

isnan ‡'test for a NaN

SYNOPSIS

```
#include <math.h>

int isnan(real-floating x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *isnan*( ) macro shall determine whether its argument value is a NaN. First, an argument represented in a format wider than its semantic type is converted to its semantic type. Then determination is based on the type of the argument.

RETURN VALUE

The *isnan*( ) macro shall return a non-zero value if and only if its argument has a NaN value.

ERRORS

NAME

isprint, isprint_l ‡'test for a printable character

SYNOPSIS

```
#include <ctype.h>

int isprint(int c);
CX int isprint_l(int c, locale_t locale);
```

DESCRIPTION

CX For *isprint*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

CX The *isprint*( ) and *isprint_l*( ) functions shall test whether *c* is a character of class **print** in the CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

CX The behavior is undefined if the *locale* argument to *isprint_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

CX The *isprint*( ) and *isprint_l*( ) functions shall return non-zero if *c* is a printable character; otherwise, they shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

Issue 7

The *isupper_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0306 [302], XSH/TC1-2008/0307 [283], and XSH/TC1-2008/0308 [283] are applied.

40188 **NAME**

40189 iswalnum, iswalnum_l ‡'test for an alphanumeric wide-character code

40190 **SYNOPSIS**

40191 `#include <wctype.h>`

40192 `int iswalnum(wint_t wc);`

40193 CX `int iswalnum_l(wint_t wc, locale_t locale);`

40194 **DESCRIPTION**

40195 CX For *iswalnum*( ): The functionality described on this reference page is aligned with the ISO C
40196 standard. Any conflict between the requirements described here and the ISO C standard is
40197 unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

40198 CX The *iswalnum*( ) and *iswalnum_l*( ) functions shall test whether *wc* is a wide-character code
40199 CX representing a character of class **alpha** or **digit** in the current locale, or in the locale represented
40200 by *locale*, respectively; see XBD Chapter 7 (on page 135).

40201 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
40202 code corresponding to a valid character in the locale used by the function, or equal to the value
40203 of the macro WEOF. If the argument has any other value, the behavior is undefined.

40204 CX The behavior is undefined if the *locale* argument to *iswalnum_l*( ) is the special locale object
40205 LC_GLOBAL_LOCALE or is not a valid locale object handle.

40206 **RETURN VALUE**

40207 CX The *iswalnum*( ) and *iswalnum_l*( ) functions shall return non-zero if *wc* is an alphanumeric
40208 wide-character code; otherwise, they shall return 0.

40209 **ERRORS**

40210 No errors are defined.

40211 **EXAMPLES**

40212 None.

40213 **APPLICATION USAGE**

40214 To ensure applications portability, especially across natural languages, only these functions and
40215 the functions in the reference pages listed in the SEE ALSO section should be used for character
40216 classification.

40217 **RATIONALE**

40218 None.

40219 **FUTURE DIRECTIONS**

40220 None.

40221 **SEE ALSO**

40225 **CHANGE HISTORY**

40226 First released as a World-wide Portability Interface in Issue 4.

40227 **Issue 5**

40228 The following change has been made in this version for alignment with
40229 ISO/IEC 9899: 1990/Amendment 1: 1995 (E):

The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

The *iswalnum_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0309 [302], XSH/TC1-2008/0310 [283], and XSH/TC1-2008/0311 [283] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0180 [685] is applied.

NAME

iswalpha, iswalpha_l ‡'test for an alphabetic wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswalpha(wint_t wc);
CX int iswalpha_l(wint_t wc, locale_t locale);
```

DESCRIPTION

CX For *iswalpha*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

CX The *iswalpha*( ) and *iswalpha_l*( ) functions shall test whether *wc* is a wide-character code CX representing a character of class **alpha** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the locale used by the function, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

CX The behavior is undefined if the *locale* argument to *iswalpha_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

CX The *iswalpha*( ) and *iswalpha_l*( ) functions shall return non-zero if *wc* is an alphabetic wide-character code; otherwise, they shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4.

Issue 5

The following change has been made in this version for alignment with ISO/IEC 9899: 1990/Amendment 1: 1995 (E):

The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

The *iswalpha_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0312 [302], XSH/TC1-2008/0313 [283], and XSH/TC1-2008/0314 [283] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0181 [685] is applied.

40292 **NAME**

40293 iswblank, iswblank_l ‡'test for a blank wide-character code

40294 **SYNOPSIS**

40295 `#include <wctype.h>`

40296 `int iswblank(wint_t wc);`

40297 CX `int iswblank_l(wint_t wc, locale_t locale);`

40298 **DESCRIPTION**

40299 CX For *iswblank*( ): The functionality described on this reference page is aligned with the ISO C
40300 standard. Any conflict between the requirements described here and the ISO C standard is
40301 unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

40302 CX The *iswblank*( ) and *iswblank*( ) functions shall test whether *wc* is a wide-character code
40303 CX representing a character of class **blank** in the current locale, or in the locale represented by
40304 *locale*, respectively; see XBD Chapter 7 (on page 135).

40305 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
40306 code corresponding to a valid character in the locale used by the function, or equal to the value
40307 of the macro WEOF. If the argument has any other value, the behavior is undefined.

40308 CX The behavior is undefined if the *locale* argument to *iswblank_l*( ) is the special locale object
40309 LC_GLOBAL_LOCALE or is not a valid locale object handle.

40310 **RETURN VALUE**

40311 CX The *iswblank*( ) and *iswblank_l*( ) functions shall return non-zero if *wc* is a blank wide-character
40312 code; otherwise, they shall return 0.

40313 **ERRORS**

40314 No errors are defined.

40315 **EXAMPLES**

40316 None.

40317 **APPLICATION USAGE**

40318 To ensure applications portability, especially across natural languages, only these functions and
40319 the functions in the reference pages listed in the SEE ALSO section should be used for character
40320 classification.

40321 **RATIONALE**

40322 None.

40323 **FUTURE DIRECTIONS**

40324 None.

40325 **SEE ALSO**

40328 XBD Chapter 7 (on page 135), **<locale.h>**, **<wctype.h>**

40329 **CHANGE HISTORY**

40330 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

40331 **Issue 7**

40332 The *iswblank_l*( ) function is added from The Open Group Technical Standard, 2006, Extended
40333 API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0315 [302], XSH/TC1-2008/0316 [283], and XSH/TC1-2008/0317 [283] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0182 [685] is applied.

NAME

iswcntrl, iswcntrl_l — test for a control wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswcntrl(wint_t wc);
int iswcntrl_l(wint_t wc, locale_t locale);
```

DESCRIPTION

For *iswcntrl*(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *iswcntrl*( ) and *iswcntrl_l*( ) functions shall test whether *wc* is a wide-character code representing a character of class **cntrl** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the locale used by the function, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

The behavior is undefined if the *locale* argument to *iswcntrl_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

The *iswcntrl*( ) and *iswcntrl_l*( ) functions shall return non-zero if *wc* is a control wide-character code; otherwise, they shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

CHANGE HISTORY

First released in Issue 4.

Issue 5

The following change has been made in this version for alignment with ISO/IEC 9899: 1990/Amendment 1: 1995 (E):

The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

The *iswcntrl_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0318 [302], XSH/TC1-2008/0319 [283], and XSH/TC1-2008/0320 [283] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0183 [685] is applied.

NAME

iswctype, iswctype_l ‡'test character for a specified class

SYNOPSIS

```
#include <wctype.h>

int iswctype(wint_t wc, wctype_t charclass);
int iswctype_l(wint_t wc, wctype_t charclass,
    locale_t locale);
```

DESCRIPTION

For *iswctype*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *iswctype*( ) and *iswctype_l*( ) functions shall determine whether the wide-character code *wc* has the character class *charclass*, returning true or false. The *iswctype*( ) and *iswctype_l*( ) functions are defined on WEOF and wide-character codes corresponding to the valid character encodings in the current locale, or in the locale represented by *locale*, respectively. If the *wc* argument is not in the domain of the function, the result is undefined. If the value of *charclass* is invalid (that is, not obtained by a call to *wctype*( ) or *charclass* is invalidated by a subsequent call to *setlocale*( ) that has affected category *LC_CTYPE*) the result is unspecified.

The behavior is undefined if the *locale* argument to *iswctype_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

The *iswctype*( ) and *iswctype_l*( ) functions shall return non-zero (true) if and only if *wc* has the property described by *charclass*. If *charclass* is (**wctype_t**)0, these functions shall return 0.

ERRORS

No errors are defined.

EXAMPLES

Testing for a Valid Character

```
#include <wctype.h>
...
int yes_or_no;
wint_t wc;
wctype_t valid_class;
...
if ((valid_class=wctype("vowel")) == (wctype_t)0)
    /* Invalid character class. */
yes_or_no=iswctype(wc,valid_class);
```

APPLICATION USAGE

The twelve strings "alnum", "alpha", "blank", "cntrl", "digit", "graph", "lower", "print", "punct", "space", "upper", and "xdigit" are reserved for the standard character classes. In the table below, the functions in the left column are equivalent to the functions in the right column.

```
iswalnum(wc)            iswctype(wc, wctype("alnum"))
iswalnum_l(wc, locale)  iswctype_l(wc, wctype("alnum"), locale)
iswalpha(wc)            iswctype(wc, wctype("alpha"))
iswalpha_l(wc, locale)  iswctype_l(wc, wctype("alpha"), locale)
```

```
iswblank(wc)             iswctype(wc, wctype("blank"))
iswblank_l(wc, locale)   iswctype_l(wc, wctype("blank"), locale)
iswcntrl(wc)             iswctype(wc, wctype("cntrl"))
iswcntrl_l(wc, locale)   iswctype_l(wc, wctype("cntrl"), locale)
iswdigit(wc)             iswctype(wc, wctype("digit"))
iswdigit_l(wc, locale)   iswctype_l(wc, wctype("digit"), locale)
iswgraph(wc)             iswctype(wc, wctype("graph"))
iswgraph_l(wc, locale)   iswctype_l(wc, wctype("graph"), locale)
iswlower(wc)             iswctype(wc, wctype("lower"))
iswlower_l(wc, locale)   iswctype_l(wc, wctype("lower"), locale)
iswprint(wc)             iswctype(wc, wctype("print"))
iswprint_l(wc, locale)   iswctype_l(wc, wctype("print"), locale)
iswpunct(wc)             iswctype(wc, wctype("punct"))
iswpunct_l(wc, locale)   iswctype_l(wc, wctype("punct"), locale)
iswspace(wc)             iswctype(wc, wctype("space"))
iswspace_l(wc, locale)   iswctype_l(wc, wctype("space"), locale)
iswupper(wc)             iswctype(wc, wctype("upper"))
iswupper_l(wc, locale)   iswctype_l(wc, wctype("upper"), locale)
iswxdigit(wc)            iswctype(wc, wctype("xdigit"))
iswxdigit_l(wc, locale) iswctype_l(wc, wctype("xdigit"), locale)
```

RATIONALE

XBD **<locale.h>**, **<wctype.h>**

CHANGE HISTORY

First released as World-wide Portability Interfaces in Issue 4.

Issue 5

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

> The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The behavior of *charclass* = (**wctype_t**)0 is now described.

An example is added.

A new function, *iswblank*( ), is added to the list in the APPLICATION USAGE.

Issue 7

The *iswctype_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0321 [283] and XSH/TC1-2008/0322 [283] are applied.

40478 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0184 [799] and XSH/TC2-2008/0185
40479 [799] are applied.

NAME

iswdigit, iswdigit_l ‡'test for a decimal digit wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswdigit(wint_t wc);
int iswdigit_l(wint_t wc, locale_t locale);
```

DESCRIPTION

For *iswdigit*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *iswdigit*( ) and *iswdigit_l*( ) functions shall test whether *wc* is a wide-character code representing a character of class **digit** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the locale used by the function, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

The behavior is undefined if the *locale* argument to *iswdigit_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

The *iswdigit*( ) and *iswdigit_l*( ) functions shall return non-zero if *wc* is a decimal digit wide-character code; otherwise, they shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

The *iswdigit_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0323 [302], XSH/TC1-2008/0324 [283], and XSH/TC1-2008/0325 [283] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0186 [685] is applied.

NAME

iswgraph, iswgraph_l ‡'test for a visible wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswgraph(wint_t wc);
CX int iswgraph_l(wint_t wc, locale_t locale);
```

DESCRIPTION

CX For *iswgraph*(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

CX The *iswgraph*() and *iswgraph_l*() functions shall test whether *wc* is a wide-character code CX representing a character of class **graph** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the locale used by the function, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

CX The behavior is undefined if the *locale* argument to *iswgraph_l*() is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

CX The *iswgraph*() and *iswgraph_l*() functions shall return non-zero if *wc* is a wide-character code with a visible representation; otherwise, they shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

SEE ALSO

iswalnum(), *iswalpha*(), *iswcntrl*(), *iswctype*(), *iswdigit*(), *iswgraph*(), *iswlower*(), *iswpunct*(), *iswspace*(), *iswupper*(), *iswxdigit*(), *setlocale*(), *uselocale*()

XBD Chapter 7 (on page 135), **<locale.h>**, **<wctype.h>**

CHANGE HISTORY

First released in Issue 4.

Issue 5

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

The *iswprint_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0332 [302], XSH/TC1-2008/0333 [283], and XSH/TC1-2008/0334 [283] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0189 [685] is applied.

NAME

iswpunct, iswpunct_l ‡'test for a punctuation wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswpunct(wint_t wc);
CX int iswpunct_l(wint_t wc, locale_t locale);
```

DESCRIPTION

CX For *iswpunct*(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

CX The *iswpunct*() and *iswpunct_l*() functions shall test whether *wc* is a wide-character code CX representing a character of class **punct** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the locale used by the function, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

CX The behavior is undefined if the *locale* argument to *iswpunct_l*() is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

CX The *iswpunct*() and *iswpunct_l*() functions shall return non-zero if *wc* is a punctuation wide-character code; otherwise, they shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

NAME

iswspace, iswspace_l ‡'test for a white-space wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswspace(wint_t wc);
int iswspace_l(wint_t wc, locale_t locale);
```

DESCRIPTION

For *iswspace*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *iswspace*( ) and *iswspace_l*( ) functions shall test whether *wc* is a wide-character code representing a character of class **space** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the locale used by the function, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

The behavior is undefined if the *locale* argument to *iswspace_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

The *iswspace*( ) and *iswspace_l*( ) functions shall return non-zero if *wc* is a white-space wide-character code; otherwise, they shall return 0.

ERRORS

No errors are defined.

NAME

isxdigit, isxdigit_l ‡'test for a hexadecimal digit

SYNOPSIS

```
#include <ctype.h>

int isxdigit(int c);
CX int isxdigit_l(int c, locale_t locale);
```

DESCRIPTION

CX For *isxdigit*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

CX The *isxdigit*( ) and *isxdigit_l*( ) functions shall test whether *c* is a character of class **xdigit** in the CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

CX The behavior is undefined if the *locale* argument to *isxdigit_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

CX The *isxdigit*( ) and *isxdigit_l*( ) functions shall return non-zero if *c* is a hexadecimal digit; otherwise, they shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

The *isxdigit_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0347 [302], XSH/TC1-2008/0348 [283], and XSH/TC1-2008/0349 [283] are applied.

40942 **NAME**

40943 j0, j1, jn ‡'Bessel functions of the first kind

40944 **SYNOPSIS**

40945 XSI
```
#include <math.h>

double j0(double x);
double j1(double x);
double jn(int n, double x);
```

40949 **DESCRIPTION**

40950 The *j0*( ), *j1*( ), and *jn*( ) functions shall compute Bessel functions of *x* of the first kind of orders 0,
40951 1, and *n*, respectively.

40952 An application wishing to check for error situations should set *errno* to zero and call
40953 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
40954 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
40955 zero, an error has occurred.

40956 **RETURN VALUE**

40957 Upon successful completion, these functions shall return the relevant Bessel value of *x* of the
40958 first kind.

40959 If the *x* argument is too large in magnitude, or the correct result would cause underflow, 0 shall
40960 be returned and a range error may occur.

40961 MXX If *x* is NaN, a NaN shall be returned.

40962 **ERRORS**

40963 These functions may fail if:

40964 Range Error The value of *x* was too large in magnitude, or an underflow occurred.

40965 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
40966 then *errno* shall be set to [ERANGE]. If the integer expression
40967 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
40968 floating-point exception shall be raised.

40969 No other errors shall occur.

40970 **EXAMPLES**

40971 None.

40972 **APPLICATION USAGE**

40973 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
40974 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

40975 **RATIONALE**

40976 None.

40977 **FUTURE DIRECTIONS**

40978 None.

40979 **SEE ALSO**

40980 *feclearexcept*( ), *fetestexcept*( ), *isnan*( ), *y0*( )

40981 XBD Section 4.20 (on page 117), **<math.h>**

40982 **CHANGE HISTORY**

40983 First released in Issue 1. Derived from Issue 1 of the SVID.

40984 **Issue 5**

40985 The DESCRIPTION is updated to indicate how an application should check for an error. This
40986 text was previously published in the APPLICATION USAGE section.

40987 **Issue 6**

40988 The may fail [EDOM] error is removed for the case for NaN.

40989 The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling
40990 with the ISO/IEC 9899: 1999 standard.

40991 **Issue 7**

40992 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0350 [68] is applied.

40993 **NAME**

40994 jrand48 ‡’generate a uniformly distributed pseudo-random long signed integer

40995 **SYNOPSIS**

40996 XSI
```
#include <stdlib.h>

long jrand48(unsigned short xsubi[3]);
```

40997

40998 **DESCRIPTION**

40999 Refer to *drand48( )*.

41000 **NAME**

41001 kill — send a signal to a process or a group of processes

41002 **SYNOPSIS**

41003 CX
```
#include <signal.h>

int kill(pid_t pid, int sig);
```

41004

41005 **DESCRIPTION**

41006 The *kill*( ) function shall send a signal to a process or a group of processes specified by *pid*. The
41007 signal to be sent is specified by *sig* and is either one from the list given in **<signal.h>** or 0. If *sig* is
41008 0 (the null signal), error checking is performed but no signal is actually sent. The null signal can
41009 be used to check the validity of *pid*.

41010 For a process to have permission to send a signal to a process designated by *pid*, unless the
41011 sending process has appropriate privileges, the real or effective user ID of the sending process
41012 shall match the real or saved set-user-ID of the receiving process.

41013 If *pid* is greater than 0, *sig* shall be sent to the process whose process ID is equal to *pid*.

41014 If *pid* is 0, *sig* shall be sent to all processes (excluding an unspecified set of system processes)
41015 whose process group ID is equal to the process group ID of the sender, and for which the process
41016 has permission to send a signal.

41017 If *pid* is –1, *sig* shall be sent to all processes (excluding an unspecified set of system processes) for
41018 which the process has permission to send that signal.

41019 If *pid* is negative, but not –1, *sig* shall be sent to all processes (excluding an unspecified set of
41020 system processes) whose process group ID is equal to the absolute value of *pid*, and for which
41021 the process has permission to send a signal.

41022 If the value of *pid* causes *sig* to be generated for the sending process, and if *sig* is not blocked for
41023 the calling thread and if no other thread has *sig* unblocked or is waiting in a *sigwait*( ) function
41024 for *sig*, either *sig* or at least one pending unblocked signal shall be delivered to the sending
41025 thread before *kill*( ) returns.

41026 The user ID tests described above shall not be applied when sending SIGCONT to a process that
41027 is a member of the same session as the sending process.

41028 An implementation that provides extended security controls may impose further
41029 implementation-defined restrictions on the sending of signals, including the null signal. In
41030 particular, the system may deny the existence of some or all of the processes specified by *pid*.

41031 The *kill*( ) function is successful if the process has permission to send *sig* to any of the processes
41032 specified by *pid*. If *kill*( ) fails, no signal shall be sent.

41033 **RETURN VALUE**

41034 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
41035 indicate the error.

41036 **ERRORS**

41037 The *kill*( ) function shall fail if:

41038 [EINVAL] The value of the *sig* argument is an invalid or unsupported signal number.

41039 [EPERM] The process does not have permission to send the signal to any receiving
41040 process.

[ESRCH] No process or process group can be found corresponding to that specified by *pid*.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The semantics for permission checking for *kill*( ) differed between System V and most other implementations, such as Version 7 or 4.3 BSD. The semantics chosen for this volume of POSIX.1-2017 agree with System V. Specifically, a set-user-ID process cannot protect itself against signals (or at least not against SIGKILL) unless it changes its real user ID. This choice allows the user who starts an application to send it signals even if it changes its effective user ID. The other semantics give more power to an application that wants to protect itself from the user who ran it.

Some implementations provide semantic extensions to the *kill*( ) function when the absolute value of *pid* is greater than some maximum, or otherwise special, value. Negative values are a flag to *kill*( ). Since most implementations return [ESRCH] in this case, this behavior is not included in this volume of POSIX.1-2017, although a conforming implementation could provide such an extension.

The unspecified processes to which a signal cannot be sent may include the scheduler or *init*.

There was initially strong sentiment to specify that, if *pid* specifies that a signal be sent to the calling process and that signal is not blocked, that signal would be delivered before *kill*( ) returns. This would permit a process to call *kill*( ) and be guaranteed that the call never return. However, historical implementations that provide only the *signal*( ) function make only the weaker guarantee in this volume of POSIX.1-2017, because they only deliver one signal each time a process enters the kernel. Modifications to such implementations to support the *sigaction*( ) function generally require entry to the kernel following return from a signal-catching function, in order to restore the signal mask. Such modifications have the effect of satisfying the stronger requirement, at least when *sigaction*( ) is used, but not necessarily when *signal*( ) is used. The standard developers considered making the stronger requirement except when *signal*( ) is used, but felt this would be unnecessarily complex. Implementors are encouraged to meet the stronger requirement whenever possible. In practice, the weaker requirement is the same, except in the rare case when two signals arrive during a very short window. This reasoning also applies to a similar requirement for *sigprocmask*( ).

In 4.2 BSD, the SIGCONT signal can be sent to any descendant process regardless of user-ID security checks. This allows a job control shell to continue a job even if processes in the job have altered their user IDs (as in the *su* command). In keeping with the addition of the concept of sessions, similar functionality is provided by allowing the SIGCONT signal to be sent to any process in the same session regardless of user ID security checks. This is less restrictive than BSD in the sense that ancestor processes (in the same session) can now be the recipient. It is more restrictive than BSD in the sense that descendant processes that form new sessions are now subject to the user ID checks. A similar relaxation of security is not necessary for the other job control signals since those signals are typically sent by the terminal driver in recognition of special characters being typed; the terminal driver bypasses all security checks.

In secure implementations, a process may be restricted from sending a signal to a process having a different security label. In order to prevent the existence or nonexistence of a process from being used as a covert channel, such processes should appear nonexistent to the sender; that is, [ESRCH] should be returned, rather than [EPERM], if *pid* refers only to such processes.

Historical implementations varied on the result of a *kill*( ) with *pid* indicating a zombie process. Some indicated success on such a call (subject to permission checking), while others gave an error of [ESRCH]. Since the definition of process lifetime in this volume of POSIX.1-2017 covers zombie processes, the [ESRCH] error as described is inappropriate in this case and implementations that give this error do not conform. This means that an application cannot have a parent process check for termination of a particular child by sending it the null signal with *kill*( ), but must instead use *waitpid*( ) or *waitid*( ).

There is some belief that the name *kill*( ) is misleading, since the function is not always intended to cause process termination. However, the name is common to all historical implementations, and any change would be in conflict with the goal of minimal changes to existing application code.

FUTURE DIRECTIONS

None.

XBD **<signal.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the second paragraph is reworded to indicate that the saved set-user-ID of the calling process is checked in place of its effective user ID. This is a FIPS requirement.
- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The behavior when *pid* is –1 is now specified. It was previously explicitly unspecified in the POSIX.1-1988 standard.

The normative text is updated to avoid use of the term ``must'' for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/51 is applied, correcting the RATIONALE section.

Issue 7

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0194 [765] is applied.

NAME

killpg — send a signal to a process group

SYNOPSIS

XSI
```
#include <signal.h>

int killpg(pid_t pgrp, int sig);
```

DESCRIPTION

The *killpg*( ) function shall send the signal specified by *sig* to the process group specified by *pgrp*.

If *pgrp* is greater than 1, *killpg*(*pgrp*, *sig*) shall be equivalent to *kill*(–*pgrp*, *sig*). If *pgrp* is less than or equal to 1, the behavior of *killpg*( ) is undefined.

RETURN VALUE

Refer to *kill*( ).

ERRORS

Refer to *kill*( ).

EXAMPLES

Sending a Signal to All Other Members of a Process Group

The following example shows how the calling process could send a signal to all other members of its process group. To prevent itself from receiving the signal it first makes itself immune to the signal by ignoring it.

```
#include <signal.h>
#include <unistd.h>
...
    if (signal(SIGUSR1, SIG_IGN) == SIG_ERR)
        /* Handle error */;

    if (killpg(getpgrp(), SIGUSR1) == -1)
        /* Handle error */;"
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/52 is applied, adding the example to the EXAMPLES section.

NAME

l64a ‡'convert a 32-bit integer to a radix-64 ASCII string

SYNOPSIS

XSI

```
#include <stdlib.h>

char *l64a(long value);
```

DESCRIPTION

Refer to *a64l( )*.

41174 **NAME**

41175 labs, llabs — return a long integer absolute value

41176 **SYNOPSIS**

41177 ```
#include <stdlib.h>
```

41178 ```
long labs(long i);
```

41179 ```
long long llabs(long long i);
```

41180 **DESCRIPTION**

41181 CX The functionality described on this reference page is aligned with the ISO C standard. Any
41182 conflict between the requirements described here and the ISO C standard is unintentional. This
41183 volume of POSIX.1-2017 defers to the ISO C standard.

41184 The *labs*( ) function shall compute the absolute value of the **long** integer operand *i*. The *llabs*( )
41185 function shall compute the absolute value of the **long long** integer operand *i*. If the result
41186 cannot be represented, the behavior is undefined.

41187 **RETURN VALUE**

41188 The *labs*( ) function shall return the absolute value of the **long** integer operand.

41189 The *llabs*( ) function shall return the absolute value of the **long long** integer operand.

41190 **ERRORS**

41191 No errors are defined.

41192 **EXAMPLES**

41193 None.

41194 **APPLICATION USAGE**

41195 None.

41196 **RATIONALE**

41197 None.

41198 **FUTURE DIRECTIONS**

41199 None.

41201 *abs*( )

41202 XBD **<stdlib.h>**

41203 **CHANGE HISTORY**

41204 First released in Issue 4. Derived from the ISO C standard.

41205 **Issue 6**

41206 The *llabs*( ) function is added for alignment with the ISO/IEC 9899: 1999 standard.

41207 **Issue 7**

41208 SD5-XSH-ERN-152 is applied, correcting the RETURN VALUE section.

  
```

41209 **NAME**

41210 lchown — change the owner and group of a symbolic link

41211 **SYNOPSIS**

41212 `#include <unistd.h>`

41213 `int lchown(const char *path, uid_t owner, gid_t group);`

41214 **DESCRIPTION**

41215 The *lchown*( ) function shall be equivalent to *chown*( ), except in the case where the named file is a
41216 symbolic link. In this case, *lchown*( ) shall change the ownership of the symbolic link file itself,
41217 while *chown*( ) changes the ownership of the file or directory to which the symbolic link refers.

41218 **RETURN VALUE**

41219 Upon successful completion, *lchown*( ) shall return 0. Otherwise, it shall return –1 and set *errno* to
41220 indicate an error.

41221 **ERRORS**

41222 The *lchown*( ) function shall fail if:

41223 [EACCES] Search permission is denied on a component of the path prefix of *path*.

41224 [EINVAL] The owner or group ID is not a value supported by the implementation.

41225 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
41226 argument.

41227 [ENAMETOOLONG]
41228 The length of a component of a pathname is longer than {NAME_MAX}.

41229 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

41230 [ENOTDIR] A component of the path prefix names an existing file that is neither a
41231 directory nor a symbolic link to a directory, or the *path* argument contains at
41232 least one non-<slash> character and ends with one or more trailing <slash>
41233 characters and the last pathname component names an existing file that is
41234 neither a directory nor a symbolic link to a directory.

41235 [EPERM] The effective user ID does not match the owner of the file and the process does
41236 not have appropriate privileges.

41237 [EROFS] The file resides on a read-only file system.

41238 The *lchown*( ) function may fail if:

41239 [EIO] An I/O error occurred while reading or writing to the file system.

41240 [EINTR] A signal was caught during execution of the function.

41241 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
41242 resolution of the *path* argument.

41243 [ENAMETOOLONG]
41244 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
41245 symbolic link produced an intermediate result with a length that exceeds
41246 {PATH_MAX}.

EXAMPLES

Changing the Current Owner of a File

The following example shows how to change the ownership of the symbolic link named **/modules/pass1** to the user ID associated with ``jones'' and the group ID associated with ``cnd''.

The numeric value for the user ID is obtained by using the *getpwnam*( ) function. The numeric value for the group ID is obtained by using the *getgrnam*( ) function.

```
#include <sys/types.h>
#include <unistd.h>
#include <pwd.h>
#include <grp.h>

struct passwd *pwd;
struct group  *grp;
char          *path = "/modules/pass1";
...
pwd = getpwnam("jones");
grp = getgrnam("cnd");
lchown(path, pwd->pw_uid, grp->gr_gid);
```

APPLICATION USAGE

On implementations which support symbolic links as directory entries rather than files, *lchown*( ) may fail.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

The Open Group Base Resolution bwg2001-013 is applied, adding wording to the APPLICATION USAGE.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *lchown*( ) function is moved from the XSI option to the Base.

The [EOPNOTSUPP] error is removed.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

41289 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0351 [324] is applied.

41290 **NAME**

41291 lcong48 ‡'seed a uniformly distributed pseudo-random signed long integer generator

41292 **SYNOPSIS**

41293 XSI
```
#include <stdlib.h>

void lcong48(unsigned short param[7]);
```

41294

41295 **DESCRIPTION**

41296 Refer to *drand48*( ).

NAME

ldexp, ldexpf, ldexpl ‡'load exponent of a floating-point number

SYNOPSIS

```
#include <math.h>

double ldexp(double x, int exp);
float ldexpf(float x, int exp);
long double ldexpl(long double x, int exp);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall compute the quantity $x * 2^{exp}$.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return *x* multiplied by 2, raised to the power *exp*.

If these functions would cause overflow, a range error shall occur and *ldexp*( ), *ldexpf*( ), and *ldexpl*( ) shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (according to the sign of *x*), respectively.

MXX If the correct value would cause underflow, and is not representable, a range error may occur, and *ldexp*( ), *ldexpf*( ), and *ldexpl*( ) shall return 0.0, or (if IEC 60559 Floating-Point is not supported) an implementation-defined value no greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0 or ±Inf, *x* shall be returned.

If *exp* is 0, *x* shall be returned.

MXX If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions shall fail if:

Range Error The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Range Error The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow

floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.20 (on page 117), **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *ldexpf*( ) and *ldexpl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0352 [68] and XSH/TC1-2008/0353 [68] are applied.

NAME

ldiv, lldiv — compute quotient and remainder of a long division

SYNOPSIS

```
#include <stdlib.h>

ldiv_t ldiv(long numer, long denom);
lldiv_t lldiv(long long numer, long long denom);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall compute the quotient and remainder of the division of the numerator *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the **long** integer (for the *ldiv*( ) function) or **long long** integer (for the *lldiv*( ) function) of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be represented, the behavior is undefined; otherwise, *quot* * *denom*+*rem* shall equal *numer*.

RETURN VALUE

The *ldiv*( ) function shall return a structure of type **ldiv_t**, comprising both the quotient and the remainder. The structure shall include the following members, in any order:

```
long   quot;    /* Quotient */
long   rem;     /* Remainder */
```

The *lldiv*( ) function shall return a structure of type **lldiv_t**, comprising both the quotient and the remainder. The structure shall include the following members, in any order:

```
long long   quot;    /* Quotient */
long long   rem;     /* Remainder */
```

ERRORS

No errors are defined.

EXAMPLES

Issue 6

The *lldiv*( ) function is added for alignment with the ISO/IEC 9899: 1999 standard.

NAME

lfind — find entry in a linear search table

SYNOPSIS

XSI

```
#include <search.h>

void *lfind(const void *key, const void *base, size_t *nelp,
    size_t width, int (*compar)(const void *, const void *));
```

DESCRIPTION

Refer to *lsearch( )*.

NAME

lgamma, lgammaf, lgammal, signgam ‡'log gamma function

SYNOPSIS

```
#include <math.h>

double lgamma(double x);
float lgammaf(float x);
long double lgammal(long double x);
XSI extern int signgam;
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall compute $\log_e|\Gamma(x)|$ where $\Gamma(x)$ is defined as $\int_0^\infty e^{-t}t^{x-1}dt$. The argument x need not be a non-positive integer ($\Gamma(x)$ is defined over the reals, except the non-positive integers).

XSI If x is NaN, –Inf, or a negative integer, the value of *signgam* is unspecified.

CX These functions need not be thread-safe.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the logarithmic gamma of x.

If x is a non-positive integer, a pole error shall occur and *lgamma*( ), *lgammaf*( ), and *lgammal*( ) shall return +HUGE_VAL, +HUGE_VALF, and +HUGE_VALL, respectively.

If the correct value would cause overflow, a range error shall occur and *lgamma*( ), *lgammaf*( ), and *lgammal*( ) shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (having the same sign as the correct value), respectively.

MX If x is NaN, a NaN shall be returned.

If x is 1 or 2, +0 shall be returned.

If x is ±Inf, +Inf shall be returned.

ERRORS

These functions shall fail if:

Pole Error — The x argument is a negative integer or zero.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised.

Range Error — The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression

41458 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
41459 floating-point exception shall be raised.

41460 **EXAMPLES**

41461 None.

41462 **APPLICATION USAGE**

41463 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
41464 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

41465 **RATIONALE**

41466 None.

41467 **FUTURE DIRECTIONS**

41468 None.

41469 **SEE ALSO**

41470 *exp*( ), *feclearexcept*( ), *fetestexcept*( ), *isnan*( )

41471 XBD Section 4.20 (on page 117), **<math.h>**

41472 **CHANGE HISTORY**

41473 First released in Issue 3.

41474 **Issue 5**

41475 The DESCRIPTION is updated to indicate how an application should check for an error. This
41476 text was previously published in the APPLICATION USAGE section.

41477 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

41478 **Issue 6**

41479 The *lgamma*( ) function is no longer marked as an extension.

41480 The *lgammaf*( ) and *lgammal*( ) functions are added for alignment with the ISO/IEC 9899: 1999
41481 standard.

41482 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
41483 revised to align with the ISO/IEC 9899: 1999 standard.

41484 IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are
41485 marked.

41486 Functionality relating to the XSI option is marked.

41487 **Issue 7**

41488 Austin Group Interpretation 1003.1-2001 #156 is applied.

41489 The DESCRIPTION is clarified regarding the value of *signgam* when *x* is Nan, –Inf, or a negative
41490 integer.

41491 **NAME**

41492 link, linkat ‡'link one file to another file

41493 **SYNOPSIS**

41494 ```
#include <unistd.h>
```

41495 ```
int link(const char *path1, const char *path2);
```

41496 OH ```
#include <fcntl.h>
```

41497 ```
int linkat(int fd1, const char *path1, int fd2,
```

41498 ```
    const char *path2, int flag);
```

41499 **DESCRIPTION**

41500 The *link*( ) function shall create a new link (directory entry) for the existing file, *path1*.

41501 The *path1* argument points to a pathname naming an existing file. The *path2* argument points to
41502 a pathname naming the new directory entry to be created. The *link*( ) function shall atomically
41503 create a new link for the existing file and the link count of the file shall be incremented by one.

41504 If *path1* names a directory, *link*( ) shall fail unless the process has appropriate privileges and the
41505 implementation supports using *link*( ) on directories.

41506 If *path1* names a symbolic link, it is implementation-defined whether *link*( ) follows the symbolic
41507 link, or creates a new link to the symbolic link itself.

41508 Upon successful completion, *link*( ) shall mark for update the last file status change timestamp of
41509 the file. Also, the last data modification and last file status change timestamps of the directory
41510 that contains the new entry shall be marked for update.

41511 If *link*( ) fails, no link shall be created and the link count of the file shall remain unchanged.

41512 The implementation may require that the calling process has permission to access the existing
41513 file.

41514 The *linkat*( ) function shall be equivalent to the *link*( ) function except that symbolic links shall be
41515 handled as specified by the value of *flag* (see below) and except in the case where either *path1* or
41516 *path2* or both are relative paths. In this case a relative path *path1* is interpreted relative to the
41517 directory associated with the file descriptor *fd1* instead of the current working directory and
41518 similarly for *path2* and the file descriptor *fd2*. If the access mode of the open file description
41519 associated with the file descriptor is not O_SEARCH, the function shall check whether directory
41520 searches are permitted using the current permissions of the directory underlying the file
41521 descriptor. If the access mode is O_SEARCH, the function shall not perform the check.

41522 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined
41523 in **<fcntl.h>**:

41524 AT_SYMLINK_FOLLOW
41525 If *path1* names a symbolic link, a new link for the target of the symbolic link is created.

41526 If *linkat*( ) is passed the special value AT_FDCWD in the *fd1* or *fd2* parameter, the current
41527 working directory shall be used for the respective *path* argument. If both *fd1* and *fd2* have value
41528 AT_FDCWD, the behavior shall be identical to a call to *link*( ), except that symbolic links shall be
41529 handled as specified by the value of *flag*.

41530 If the AT_SYMLINK_FOLLOW flag is clear in the *flag* argument and the *path1* argument names a
41531 symbolic link, a new link is created for the symbolic link *path1* and not its target.

  
```

41532 **RETURN VALUE**

41533 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
41534 return −1 and set *errno* to indicate the error.

41535 **ERRORS**

41536 These functions shall fail if:

41537 [EACCES] A component of either path prefix denies search permission, or the requested
41538 link requires writing in a directory that denies write permission, or the calling
41539 process does not have permission to access the existing file and this is required
41540 by the implementation.

41541 [EEXIST] The *path2* argument resolves to an existing directory entry or refers to a
41542 symbolic link.

41543 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path1* or
41544 *path2* argument.

41545 [EMLINK] The number of links to the file named by *path1* would exceed {LINK_MAX}.

41546 [ENAMETOOLONG]
41547 The length of a component of a pathname is longer than {NAME_MAX}.

41548 [ENOENT] A component of either path prefix does not exist; the file named by *path1* does
41549 not exist; or *path1* or *path2* points to an empty string.

41550 [ENOENT] or [ENOTDIR]
41551 The *path1* argument names an existing non-directory file, and the *path2*
41552 argument contains at least one non-<slash> character and ends with one or
41553 more trailing <slash> characters. If *path2* without the trailing <slash>
41554 characters would name an existing file, an [ENOENT] error shall not occur.

41555 [ENOSPC] The directory to contain the link cannot be extended.

41556 [ENOTDIR] A component of either path prefix names an existing file that is neither a
41557 directory nor a symbolic link to a directory, or the *path1* argument contains at
41558 least one non-<slash> character and ends with one or more trailing <slash>
41559 characters and the last pathname component names an existing file that is
41560 neither a directory nor a symbolic link to a directory, or the *path1* argument
41561 names an existing non-directory file and the *path2* argument names a
41562 nonexistent file, contains at least one non-<slash> character, and ends with
41563 one or more trailing <slash> characters.

41564 [EPERM] The file named by *path1* is a directory and either the calling process does not
41565 have appropriate privileges or the implementation prohibits using *link*( ) on
41566 directories.

41567 [EROFS] The requested link requires writing in a directory on a read-only file system.

41568 [EXDEV] The link named by *path2* and the file named by *path1* are on different file
41569 systems and the implementation does not support links between file systems.

41570 OB XSR [EXDEV] *path1* refers to a named STREAM.

41571 The *linkat*( ) function shall fail if:

41572 [EACCES] The access mode of the open file description associated with *fd1* or *fd2* is not
41573 O_SEARCH and the permissions of the directory underlying *fd1* or *fd2*,
41574 respectively, do not permit directory searches.

[EBADF] The *path1* or *path2* argument does not specify an absolute path and the *fd1* or *fd2* argument, respectively, is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

[ENOTDIR] The *path1* or *path2* argument is not an absolute path and *fd1* or *fd2*, respectively, is a file descriptor associated with a non-directory file.

These functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path1* or *path2* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

The *linkat*( ) function may fail if:

[EINVAL] The value of the *flag* argument is not valid.

EXAMPLES

Creating a Link to a File

The following example shows how to create a link to a file named **/home/cnd/mod1** by creating a new directory entry named **/modules/pass1**.

```
#include <unistd.h>

char *path1 = "/home/cnd/mod1";
char *path2 = "/modules/pass1";
int   status;
...
status = link (path1, path2);
```

Creating a Link to a File Within a Program

In the following program example, the *link*( ) function links the **/etc/passwd** file (defined as **PASSWDFILE**) to a file named **/etc/opasswd** (defined as **SAVEFILE**), which is used to save the current password file. Then, after removing the current password file (defined as **PASSWDFILE**), the new password file is saved as the current password file using the *link*( ) function again.

```
#include <unistd.h>

#define LOCKFILE "/etc/ptmp"
#define PASSWDFILE "/etc/passwd"
#define SAVEFILE "/etc/opasswd"
...
/* Save current password file */
link (PASSWDFILE, SAVEFILE);

/* Remove current password file. */
unlink (PASSWDFILE);

/* Save new password file as current password file. */
link (LOCKFILE,PASSWDFILE);
```

APPLICATION USAGE

Some implementations do allow links between file systems.

If *path1* refers to a symbolic link, application developers should use *linkat*( ) with appropriate flags to select whether or not the symbolic link should be resolved.

RATIONALE

Linking to a directory is restricted to the superuser in most historical implementations because this capability may produce loops in the file hierarchy or otherwise corrupt the file system. This volume of POSIX.1-2017 continues that philosophy by prohibiting *link*( ) and *unlink*( ) from doing this. Other functions could do it if the implementor designed such an extension.

Some historical implementations allow linking of files on different file systems. Wording was added to explicitly allow this optional behavior.

The exception for cross-file system links is intended to apply only to links that are programmatically indistinguishable from ``hard'' links.

The purpose of the *linkat*( ) function is to link files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *link*( ), resulting in unspecified behavior. By opening a file descriptor for the directory of both the existing file and the target location and using the *linkat*( ) function it can be guaranteed that the both filenames are in the desired directories.

The AT_SYMLINK_FOLLOW flag allows for implementing both common behaviors of the *link*( ) function. The POSIX specification requires that if *path1* is a symbolic link, a new link for the target of the symbolic link is created. Many systems by default or as an alternative provide a mechanism to avoid the implicit symbolic link lookup and create a new link for the symbolic link itself.

Earlier versions of this standard specified only the *link*( ) function, and required it to behave like *linkat*( ) with the AT_SYMLINK_FOLLOW flag. However, historical practice from SVR4 and Linux kernels had *link*( ) behaving like *linkat*( ) with no flags, and many systems that attempted to provide a conforming *link*( ) function did so in a way that was rarely used, and when it was used did not conform to the standard (e.g., by not being atomic, or by dereferencing the symbolic link incorrectly). Since applications could not rely on *link*( ) following links in practice, the *linkat*( ) function was added taking a flag to specify the desired behavior for the application.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

An explanation is added of the action when *path2* refers to a symbolic link.

The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

SD5-XSH-ERN-93 is applied, adding RATIONALE.

The *linkat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to XSI STREAMS is marked obsolescent.

Changes are made related to support for finegrained timestamps.

The [EOPNOTSUPP] error is removed.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0354 [326], XSH/TC1-2008/0355 [461], XSH/TC1-2008/0356 [326], XSH/TC1-2008/0357 [324], XSH/TC1-2008/0358 [147,429], XSH/TC1-2008/0359 [277], XSH/TC1-2008/0360 [278], and XSH/TC1-2008/0361 [278] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0195 [873], XSH/TC2-2008/0196 [591], XSH/TC2-2008/0197 [817], XSH/TC2-2008/0198 [822], and XSH/TC2-2008/0199 [817] are applied.

41676 **NAME**

41677 lio_listio — list directed I/O

41678 **SYNOPSIS**

41679 ```
#include <aio.h>
```

41680 ```
int lio_listio(int mode, struct aiocb *restrict const list[restrict],
```

41681 ```
    int nent, struct sigevent *restrict sig);
```

41682 **DESCRIPTION**

41683 The *lio_listio*( ) function shall initiate a list of I/O requests with a single function call.

41684 The *mode* argument takes one of the values LIO_WAIT or LIO_NOWAIT declared in **<aio.h>** and
41685 determines whether the function returns when the I/O operations have been completed, or as
41686 soon as the operations have been queued. If the *mode* argument is LIO_WAIT, the function shall
41687 wait until all I/O is complete and the *sig* argument shall be ignored.

41688 If the *mode* argument is LIO_NOWAIT, the function shall return immediately, and asynchronous
41689 notification shall occur, according to the *sig* argument, when all the I/O operations complete. If
41690 *sig* is NULL, then no asynchronous notification shall occur. If *sig* is not NULL, asynchronous
41691 notification occurs as specified in Section 2.4.1 (on page 488) when all the requests in *list* have
41692 completed.

41693 The I/O requests enumerated by *list* are submitted in an unspecified order.

41694 The *list* argument is an array of pointers to **aiocb** structures. The array contains *nent* elements.
41695 The array may contain NULL elements, which shall be ignored.

41696 If the buffer pointed to by *list* or the **aiocb** structures pointed to by the elements of the array *list*
41697 become illegal addresses before all asynchronous I/O completed and, if necessary, the
41698 notification is sent, then the behavior is undefined. If the buffers pointed to by the *aio_buf*
41699 member of the **aiocb** structure pointed to by the elements of the array *list* become illegal
41700 addresses prior to the asynchronous I/O associated with that **aiocb** structure being completed,
41701 the behavior is undefined.

41702 The *aio_lio_opcode* field of each **aiocb** structure specifies the operation to be performed. The
41703 supported operations are LIO_READ, LIO_WRITE, and LIO_NOP; these symbols are defined in
41704 **<aio.h>**. The LIO_NOP operation causes the list entry to be ignored. If the *aio_lio_opcode*
41705 element is equal to LIO_READ, then an I/O operation is submitted as if by a call to *aio_read*( )
41706 with the *aiocbp* equal to the address of the **aiocb** structure. If the *aio_lio_opcode* element is equal to
41707 LIO_WRITE, then an I/O operation is submitted as if by a call to *aio_write*( ) with the *aiocbp*
41708 equal to the address of the **aiocb** structure.

41709 The *aio_fildes* member specifies the file descriptor on which the operation is to be performed.

41710 The *aio_buf* member specifies the address of the buffer to or from which the data is transferred.

41711 The *aio_nbytes* member specifies the number of bytes of data to be transferred.

41712 The members of the **aiocb** structure further describe the I/O operation to be performed, in a
41713 manner identical to that of the corresponding **aiocb** structure when used by the *aio_read*( ) and
41714 *aio_write*( ) functions.

41715 The *nent* argument specifies how many elements are members of the list; that is, the length of the
41716 array.

41717 The behavior of this function is altered according to the definitions of synchronized I/O data
41718 integrity completion and synchronized I/O file integrity completion if synchronized I/O is
41719 enabled on the file associated with *aio_fildes*.

  
```

For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with *aiocbp* ~~*aio*~~*_fildes*.

If *sig* ~~*sigev*~~*_notify* is SIGEV_THREAD and *sig* ~~*sigev*~~*_notify_attributes* is a non-null pointer and the block pointed to by this pointer becomes an illegal address prior to all asynchronous I/O being completed, then the behavior is undefined.

RETURN VALUE

If the *mode* argument has the value LIO_NOWAIT, the *lio_listio*( ) function shall return the value zero if the I/O operations are successfully queued; otherwise, the function shall return the value −1 and set *errno* to indicate the error.

If the *mode* argument has the value LIO_WAIT, the *lio_listio*( ) function shall return the value zero when all the indicated I/O has completed successfully. Otherwise, *lio_listio*( ) shall return a value of −1 and set *errno* to indicate the error.

In either case, the return value only indicates the success or failure of the *lio_listio*( ) call itself, not the status of the individual I/O requests. In some cases one or more of the I/O requests contained in the list may fail. Failure of an individual request does not prevent completion of any other individual request. To determine the outcome of each I/O request, the application shall examine the error status associated with each **aiocb** control block. The error statuses so returned are identical to those returned as the result of an *aio_read*( ) or *aio_write*( ) function.

ERRORS

The *lio_listio*( ) function shall fail if:

[EAGAIN] The resources necessary to queue all the I/O requests were not available. The application may check the error status for each **aiocb** to determine the individual request(s) that failed.

[EAGAIN] The number of entries indicated by *nent* would cause the system-wide limit {AIO_MAX} to be exceeded.

[EINVAL] The *mode* argument is not a proper value, or the value of *nent* was greater than {AIO_LISTIO_MAX}.

[EINTR] A signal was delivered while waiting for all I/O requests to complete during an LIO_WAIT operation. Note that, since each I/O operation invoked by *lio_listio*( ) may possibly provoke a signal when it completes, this error return may be caused by the completion of one (or more) of the very I/O operations being awaited. Outstanding I/O requests are not canceled, and the application shall examine each list element to determine whether the request was initiated, canceled, or completed.

[EIO] One or more of the individual I/O operations failed. The application may check the error status for each **aiocb** structure to determine the individual request(s) that failed.

In addition to the errors returned by the *lio_listio*( ) function, if the *lio_listio*( ) function succeeds or fails with errors of [EAGAIN], [EINTR], or [EIO], then some of the I/O specified by the list may have been initiated. If the *lio_listio*( ) function fails with an error code other than [EAGAIN], [EINTR], or [EIO], no operations from the list shall have been initiated. The I/O operation indicated by each list element can encounter errors specific to the individual read or write function being performed. In this event, the error status for each **aiocb** control block contains the associated error code. The error codes that can be set are the same as would be set by a *read*( ) or *write*( ) function, with the following additional error codes possible:

41765 [EAGAIN] The requested I/O operation was not queued due to resource limitations.

41766 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit
41767 *aio_cancel*( ) request.

41768 [EFBIG] The *aiocbp* ~~*aio*~~*_lio_opcode* is LIO_WRITE, the file is a regular file,
41769 *aiocbp* ~~*aio*~~*_nbytes* is greater than 0, and the *aiocbp* ~~*aio*~~*_offset* is greater than or
41770 equal to the offset maximum in the open file description associated with
41771 *aiocbp* ~~*aio*~~*_fildes*.

41772 [EINPROGRESS] The requested I/O is in progress.

41773 [EOVERFLOW] The *aiocbp* ~~*aio*~~*_lio_opcode* is LIO_READ, the file is a regular file,
41774 *aiocbp* ~~*aio*~~*_nbytes* is greater than 0, and the *aiocbp* ~~*aio*~~*_offset* is before the
41775 end-of-file and is greater than or equal to the offset maximum in the open file
41776 description associated with *aiocbp* ~~*aio*~~*_fildes*.

41777 **EXAMPLES**

41778 None.

41779 **APPLICATION USAGE**

41780 None.

41781 **RATIONALE**

41782 Although it may appear that there are inconsistencies in the specified circumstances for error
41783 codes, the [EIO] error condition applies when any circumstance relating to an individual
41784 operation makes that operation fail. This might be due to a badly formulated request (for
41785 example, the *aio_lio_opcode* field is invalid, and *aio_error*( ) returns [EINVAL]) or might arise from
41786 application behavior (for example, the file descriptor is closed before the operation is initiated,
41787 and *aio_error*( ) returns [EBADF]).

41788 The limitation on the set of error codes returned when operations from the list shall have been
41789 initiated enables applications to know when operations have been started and whether
41790 *aio_error*( ) is valid for a specific operation.

41791 **FUTURE DIRECTIONS**

41792 None.

41793 **SEE ALSO**

41794 *aio_read*( ), *aio_write*( ), *aio_error*( ), *aio_return*( ), *aio_cancel*( ), *close*( ), *exec*, *exit*( ), *fork*( ), *lseek*( ),

41796 XBD **<aio.h>**

41797 **CHANGE HISTORY**

41798 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

41799 Large File Summit extensions are added.

41800 **Issue 6**

41801 The [ENOSYS] error condition has been removed as stubs need not be provided if an
41802 implementation does not support the Asynchronous Input and Output option.

41803 The *lio_listio*( ) function is marked as part of the Asynchronous Input and Output option.

41804 The following new requirements on POSIX implementations derive from alignment with the
41805 Single UNIX Specification:

In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs past the offset maximum established in the open file description associated with *aiocbp* ~~*aio*~~*_fildes*. This change is to support large files.

The [EBIG] and [EOVERFLOW] error conditions are defined. This change is to support large files.

The normative text is updated to avoid use of the term ``must'' for application requirements.

The **restrict** keyword is added to the *lio_listio*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 6

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/53 is applied, adding new text for symmetry with the *aio_read*( ) and *aio_write*( ) functions to the DESCRIPTION.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/54 is applied, adding text to the DESCRIPTION making it explicit that the user is required to keep the structure pointed to by *sig* ~~*sig*~~*ev_notify_attributes* valid until the last asynchronous operation finished and the notification has been sent.

Issue 7

The *lio_listio*( ) function is moved from the Asynchronous Input and Output option to the Base.

41823 **NAME**

41824 listen ‡'listen for socket connections and limit the queue of incoming connections

41825 **SYNOPSIS**

41826 `#include <sys/socket.h>`

41827 `int listen(int socket, int backlog);`

41828 **DESCRIPTION**

41829 The *listen*( ) function shall mark a connection-mode socket, specified by the *socket* argument, as
41830 accepting connections.

41831 The *backlog* argument provides a hint to the implementation which the implementation shall use
41832 to limit the number of outstanding connections in the socket's listen queue. Implementations
41833 may impose a limit on *backlog* and silently reduce the specified value. Normally, a larger *backlog*
41834 argument value shall result in a larger or equal length of the listen queue. Implementations shall
41835 support values of *backlog* up to SOMAXCONN, defined in **<sys/socket.h>**.

41836 The implementation may include incomplete connections in its listen queue. The limits on the
41837 number of incomplete connections and completed connections queued may be different.

41838 The implementation may have an upper limit on the length of the listen queue—either global or
41839 per accepting socket. If *backlog* exceeds this limit, the length of the listen queue is set to the limit.

41840 If *listen*( ) is called with a *backlog* argument value that is less than 0, the function behaves as if it
41841 had been called with a *backlog* argument value of 0.

41842 A *backlog* argument of 0 may allow the socket to accept connections, in which case the length of
41843 the listen queue may be set to an implementation-defined minimum value.

41844 The socket in use may require the process to have appropriate privileges to use the *listen*( )
41845 function.

41846 **RETURN VALUE**

41847 Upon successful completions, *listen*( ) shall return 0; otherwise, –1 shall be returned and *errno* set
41848 to indicate the error.

41849 **ERRORS**

41850 The *listen*( ) function shall fail if:

41851 [EBADF] The *socket* argument is not a valid file descriptor.

41852 [EDESTADDRREQ]
41853 The socket is not bound to a local address, and the protocol does not support
41854 listening on an unbound socket.

41855 [EINVAL] The *socket* is already connected.

41856 [ENOTSOCK] The *socket* argument does not refer to a socket.

41857 [EOPNOTSUPP] The socket protocol does not support *listen*( ).

41858 The *listen*( ) function may fail if:

41859 [EACCES] The calling process does not have appropriate privileges.

41860 [EINVAL] The *socket* has been shut down.

41861 [ENOBUFS] Insufficient resources are available in the system to complete the call.

NAME

llrint, llrintf, llrintl — round to the nearest integer value using current rounding direction

SYNOPSIS

```
#include <math.h>

long long llrint(double x);
long long llrintf(float x);
long long llrintl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall round their argument to the nearest integer value, rounding according to the current rounding direction.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the rounded integer value.

MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

If *x* is –Inf, a domain error shall occur and an unspecified value is returned.

If the correct value is positive and too large to represent as a **long long**, an unspecified value shall be returned. MX On systems that support the IEC 60559 Floating-Point option, a domain error shall occur; CX otherwise, a domain error may occur.

If the correct value is negative and too large to represent as a **long long**, an unspecified value shall be returned. MX On systems that support the IEC 60559 Floating-Point option, a domain error shall occur; CX otherwise, a domain error may occur.

ERRORS

These functions shall fail if:

MX Domain Error — The *x* argument is NaN or ±Inf, or the correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Domain Error — The correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions provide floating-to-integer conversions. They round according to the current rounding direction. If the rounded value is outside the range of the return type, the numeric result is unspecified and the invalid floating-point exception is raised. When they raise no other floating-point exception and the result differs from the argument, they raise the inexact floating-point exception.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

Issue 7

ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #53 is applied.

NAME

llround, llroundf, llroundl — round to nearest integer value

SYNOPSIS

```
#include <math.h>

long long llround(double x);
long long llroundf(float x);
long long llroundl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall round their argument to the nearest integer value, rounding halfway cases away from zero, regardless of the current rounding direction.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the rounded integer value.

MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

If *x* is –Inf, a domain error shall occur and an unspecified value is returned.

If the correct value is positive and too large to represent as a **long long**, an unspecified value shall be returned. MX On systems that support the IEC 60559 Floating-Point option, a domain error shall occur; CX otherwise, a domain error may occur.

If the correct value is negative and too large to represent as a **long long**, an unspecified value shall be returned. MX On systems that support the IEC 60559 Floating-Point option, a domain error shall occur; CX otherwise, a domain error may occur.

ERRORS

These functions shall fail if:

MX Domain Error — The *x* argument is NaN or ±Inf, or the correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Domain Error — The correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions differ from the *llrint*( ) functions in that the default rounding direction for the *llround*( ) functions round halfway cases away from zero and need not raise the inexact floating-point exception for non-integer arguments that round to within the range of the return type.

FUTURE DIRECTIONS

None.

NAME

localeconv — return locale-specific information

SYNOPSIS

```
#include <locale.h>

struct lconv *localeconv(void);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *localeconv*( ) function shall set the components of an object with the type **struct lconv** with the values appropriate for the formatting of numeric quantities (monetary and otherwise) according to the rules of the current locale.

The members of the structure with type **char *** are pointers to strings, any of which (except **decimal_point**) can point to `""`, to indicate that the value is not available in the current locale or is of zero length. The members with type **char** are non-negative numbers, any of which can be {CHAR_MAX} to indicate that the value is not available in the current locale.

The members include the following:

char *decimal_point
: The radix character used to format non-monetary quantities.

char *thousands_sep
: The character used to separate groups of digits before the decimal-point character in formatted non-monetary quantities.

char *grouping
: A string whose elements taken as one-byte integer values indicate the size of each group of digits in formatted non-monetary quantities.

char *int_curr_symbol
: The international currency symbol applicable to the current locale. The first three characters contain the alphabetic international currency symbol in accordance with those specified in the ISO 4217: 2001 standard. The fourth character (immediately preceding the null byte) is the character used to separate the international currency symbol from the monetary quantity.

char *currency_symbol
: The local currency symbol applicable to the current locale.

char *mon_decimal_point
: The radix character used to format monetary quantities.

char *mon_thousands_sep
: The separator for groups of digits before the decimal-point in formatted monetary quantities.

char *mon_grouping
: A string whose elements taken as one-byte integer values indicate the size of each group of digits in formatted monetary quantities.

char *positive_sign
: The string used to indicate a non-negative valued formatted monetary quantity.

char *negative_sign
The string used to indicate a negative valued formatted monetary quantity.

char int_frac_digits
The number of fractional digits (those after the decimal-point) to be displayed in an internationally formatted monetary quantity.

char frac_digits
The number of fractional digits (those after the decimal-point) to be displayed in a formatted monetary quantity.

char p_cs_precedes
Set to 1 if the **currency_symbol** precedes the value for a non-negative formatted monetary quantity. Set to 0 if the symbol succeeds the value.

char p_sep_by_space
Set to a value indicating the separation of the **currency_symbol**, the sign string, and the value for a non-negative formatted monetary quantity.

char n_cs_precedes
Set to 1 if the **currency_symbol** precedes the value for a negative formatted monetary quantity. Set to 0 if the symbol succeeds the value.

char n_sep_by_space
Set to a value indicating the separation of the **currency_symbol**, the sign string, and the value for a negative formatted monetary quantity.

char p_sign_posn
Set to a value indicating the positioning of the **positive_sign** for a non-negative formatted monetary quantity.

char n_sign_posn
Set to a value indicating the positioning of the **negative_sign** for a negative formatted monetary quantity.

char int_p_cs_precedes
Set to 1 or 0 if the **int_curr_symbol** respectively precedes or succeeds the value for a non-negative internationally formatted monetary quantity.

char int_n_cs_precedes
Set to 1 or 0 if the **int_curr_symbol** respectively precedes or succeeds the value for a negative internationally formatted monetary quantity.

char int_p_sep_by_space
Set to a value indicating the separation of the **int_curr_symbol**, the sign string, and the value for a non-negative internationally formatted monetary quantity.

char int_n_sep_by_space
Set to a value indicating the separation of the **int_curr_symbol**, the sign string, and the value for a negative internationally formatted monetary quantity.

char int_p_sign_posn
Set to a value indicating the positioning of the **positive_sign** for a non-negative internationally formatted monetary quantity.

char int_n_sign_posn
Set to a value indicating the positioning of the **negative_sign** for a negative internationally formatted monetary quantity.

The elements of **grouping** and **mon_grouping** are interpreted according to the following:

{CHAR_MAX} No further grouping is to be performed.

0 The previous element is to be repeatedly used for the remainder of the digits.

other The integer value is the number of digits that comprise the current group. The next element is examined to determine the size of the next group of digits before the current group.

The values of **p_sep_by_space**, **n_sep_by_space**, **int_p_sep_by_space**, and **int_n_sep_by_space** are interpreted according to the following:

0 No space separates the currency symbol and value.

1 If the currency symbol and sign string are adjacent, a space separates them from the value; otherwise, a space separates the currency symbol from the value.

2 If the currency symbol and sign string are adjacent, a space separates them; otherwise, a space separates the sign string from the value.

For **int_p_sep_by_space** and **int_n_sep_by_space**, the fourth character of **int_curr_symbol** is used instead of a space.

The values of **p_sign_posn**, **n_sign_posn**, **int_p_sign_posn**, and **int_n_sign_posn** are interpreted according to the following:

0 Parentheses surround the quantity and **currency_symbol** or **int_curr_symbol**.

1 The sign string precedes the quantity and **currency_symbol** or **int_curr_symbol**.

2 The sign string succeeds the quantity and **currency_symbol** or **int_curr_symbol**.

3 The sign string immediately precedes the **currency_symbol** or **int_curr_symbol**.

4 The sign string immediately succeeds the **currency_symbol** or **int_curr_symbol**.

The implementation shall behave as if no function in this volume of POSIX.1-2017 calls *localeconv*( ).

CX The *localeconv*( ) function need not be thread-safe.

RETURN VALUE

The *localeconv*( ) function shall return a pointer to the filled-in object. The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *localeconv*( ). In addition, the returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by subsequent calls to *setlocale*( ) with the categories LC_ALL, LC_MONETARY, or LC_NUMERIC, or by calls to *uselocale*( ) which change the categories LC_MONETARY or LC_NUMERIC. The returned pointer, pointers within the structure, the structure, and the storage areas might also be invalidated if the calling thread is terminated.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The following table illustrates the rules which may be used by four countries to format monetary quantities.

Country	Positive Format	Negative Format	International Format
Italy	€.1.230	–€.1.230	EUR.1.230
Netherlands	€ 1.234,56	€ –1.234,56	EUR 1.234,56
Norway	kr1.234,56	kr1.234,56–	NOK 1.234,56
Switzerland	SFrs.1,234.56	SFrs.1,234.56C	CHF 1,234.56

For these four countries, the respective values for the monetary members of the structure returned by *localeconv*( ) are:

	Italy	Netherlands	Norway	Switzerland
int_curr_symbol	"EUR."	"EUR "	"NOK "	"CHF "
currency_symbol	"€."	"€"	"kr"	"SFrs."
mon_decimal_point	""	","	","	"."
mon_thousands_sep	"."	"."	"."	","
mon_grouping	"\3"	"\3"	"\3"	"\3"
positive_sign	""	""	""	""
negative_sign	"-"	"-"	"-"	"C"
int_frac_digits	0	2	2	2
frac_digits	0	2	2	2
p_cs_precedes	1	1	1	1
p_sep_by_space	0	1	0	0
n_cs_precedes	1	1	1	1
n_sep_by_space	0	1	0	0
p_sign_posn	1	1	1	1
n_sign_posn	1	4	2	2
int_p_cs_precedes	1	1	1	1
int_n_cs_precedes	1	1	1	1
int_p_sep_by_space	0	0	0	0
int_n_sep_by_space	0	0	0	0
int_p_sign_posn	1	1	1	1
int_n_sign_posn	1	4	4	2

RATIONALE

None.

FUTURE DIRECTIONS

None.

42180 **CHANGE HISTORY**

42181 First released in Issue 4. Derived from the ANSI C standard.

42182 **Issue 6**

42183 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

42184 The RETURN VALUE section is rewritten to avoid use of the term ``must''.

42185 This reference page is updated for alignment with the ISO/IEC 9899: 1999 standard.

42186 ISO/IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.

42187 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/31 is applied, removing references to
42188 **int_curr_symbol** and updating the descriptions of **p_sep_by_space** and **n_sep_by_space**. These
42189 changes are for alignment with the ISO C standard.

42190 **Issue 7**

42191 Austin Group Interpretation 1003.1-2001 #156 is applied.

42192 The definitions of **int_curr_symbol** and **currency_symbol** are updated.

42193 The examples in the APPLICATION USAGE section are updated.

42194 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0362 [75] is applied.

42195 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0200 [656] is applied.

NAME

localtime, localtime_r — convert a time value to a broken-down local time

SYNOPSIS

```
#include <time.h>

struct tm *localtime(const time_t *timer);
CX struct tm *localtime_r(const time_t *restrict timer,
        struct tm *restrict result);
```

DESCRIPTION

CX For *localtime*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *localtime*( ) function shall convert the time in seconds since the Epoch pointed to by *timer* into a broken-down time, expressed as a local time. The function corrects for the timezone and any seasonal time adjustments. CX Local timezone information is used as though *localtime*( ) calls *tzset*( ).

The relationship between a time in seconds since the Epoch used as an argument to *localtime*( ) and the **tm** structure (defined in the **<time.h>** header) is that the result shall be as specified in the expression given in the definition of seconds since the Epoch (see XBD Section 4.16, on page 113) corrected for timezone and any seasonal time adjustments, where the names in the structure and in the expression correspond.

The same relationship shall apply for *localtime_r*( ).

The *localtime*( ) function need not be thread-safe.

The *asctime*( ), *ctime*( ), *gmtime*( ), and *localtime*( ) functions shall return values in one of two static objects: a broken-down time structure and an array of type **char**. Execution of any of the functions may overwrite the information returned in either of these objects by any of the other functions.

The *localtime_r*( ) function shall convert the time in seconds since the Epoch pointed to by *timer* into a broken-down time stored in the structure to which *result* points. The *localtime_r*( ) function shall also return a pointer to that same structure.

Unlike *localtime*( ), the *localtime_r*( ) function is not required to set *tzname*. If *localtime_r*( ) sets *tzname*, it shall also set *daylight* and *timezone*. If *localtime_r*( ) does not set *tzname*, it shall not set *daylight* and shall not set *timezone*.

RETURN VALUE

Upon successful completion, the *localtime*( ) function shall return a pointer to the broken-down time structure. CX If an error is detected, *localtime*( ) shall return a null pointer and set *errno* to indicate the error.

Upon successful completion, *localtime_r*( ) shall return a pointer to the structure pointed to by the argument *result*. If an error is detected, *localtime_r*( ) shall return a null pointer and set *errno* to indicate the error.

ERRORS

CX The *localtime*( ) and *localtime_r*( ) functions shall fail if:

CX [EOVERFLOW] The result cannot be represented.

EXAMPLES

Getting the Local Date and Time

The following example uses the *time*( ) function to calculate the time elapsed, in seconds, since January 1, 1970 0:00 UTC (the Epoch), *localtime*( ) to convert that value to a broken-down time, and *asctime*( ) to convert the broken-down time values into a printable string.

```
#include <stdio.h>
#include <time.h>

int main(void)
{
    time_t result;

    result = time(NULL);
    printf("%s%ju secs since the Epoch\n",
        asctime(localtime(&result)),
            (uintmax_t)result);
    return(0);
}
```

This example writes the current time to *stdout* in a form like this:

```
Wed Jun 26 10:32:15 1996
835810335 secs since the Epoch
```

Getting the Modification Time for a File

The following example prints the last data modification timestamp in the local timezone for a given file.

```
#include <stdio.h>
#include <time.h>
#include <sys/stat.h>

int
print_file_time(const char *pathname)
{
    struct stat statbuf;
    struct tm *tm;
    char timestr[BUFSIZ];

    if(stat(pathname, &statbuf) == -1)
        return -1;
    if((tm = localtime(&statbuf.st_mtime)) == NULL)
        return -1;
    if(strftime(timestr, sizeof(timestr), "%Y-%m-%d %H:%M:%S", tm) == 0)
        return -1;
    printf("%s: %s.%09ld\n", pathname, timestr, statbuf.st_mtim.tv_nsec);
    return 0;
}
```

Timing an Event

The following example gets the current time, converts it to a string using *localtime*( ) and *asctime*( ), and prints it to standard output using *fputs*( ). It then prints the number of minutes to an event being timed.

```
#include <time.h>
#include <stdio.h>
...
time_t now;
int minutes_to_event;
...
time(&now);
printf("The time is ");
fputs(asctime(localtime(&now)), stdout);
printf("There are still %d minutes to the event.\n",
    minutes_to_event);
...
```

APPLICATION USAGE

The *localtime_r*( ) function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

asctime( ), *clock*( ), *ctime*( ), *difftime*( ), *getdate*( ), *gmtime*( ), *mktime*( ), *strftime*( ), *strptime*( ), *time*( ), *tzset*( ), *utime*( )

XBD Section 4.16 (on page 113), **<time.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that the *localtime*( ) function need not be reentrant is added to the DESCRIPTION.

The *localtime_r*( ) function is included for alignment with the POSIX Threads Extension.

Issue 6

The *localtime_r*( ) function is marked as part of the Thread-Safe Functions option.

Extensions beyond the ISO C standard are marked.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *localtime_r*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Examples are added.

IEEE Std 1003.1-2001/Cor 1-2002, itemm XSH/TC1/D6/32 is applied, adding the [EOVERFLOW] error.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/55 is applied, updating the error handling for *localtime_r*( ).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/56 is applied, adding a requirement that if *localtime_r*( ) does not set the *tzname* variable, it shall not set the *daylight* or *timezone* variables. On systems supporting XSI, the *daylight*, *timezone*, and *tzname* variables should all be set to provide information for the same timezone. This updates the description of *localtime_r*( ) to mention *daylight* and *timezone* as well as *tzname*. The SEE ALSO section is updated.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

The *localtime_r*( ) function is moved from the Thread-Safe Functions option to the Base.

Changes are made to the EXAMPLES section related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0363 [291] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0201 [664] is applied.

NAME

lockf — record locking on files

SYNOPSIS

XSI
```
#include <unistd.h>

int lockf(int fildes, int function, off_t size);
```

DESCRIPTION

The *lockf*( ) function shall lock sections of a file with advisory-mode locks. Calls to *lockf*( ) from threads in other processes which attempt to lock the locked file section shall either return an error value or block until the section becomes unlocked. All the locks for a process are removed when the process terminates. Record locking with *lockf*( ) shall be supported for regular files and may be supported for other files.

The *fildes* argument is an open file descriptor. To establish a lock with this function, the file descriptor shall be opened with write-only permission (O_WRONLY) or with read/write permission (O_RDWR).

The *function* argument is a control value which specifies the action to be taken. The permissible values for *function* are defined in **<unistd.h>** as follows:

Function	Description
F_ULOCK	Unlock locked sections.
F_LOCK	Lock a section for exclusive use.
F_TLOCK	Test and lock a section for exclusive use.
F_TEST	Test a section for locks by other processes.

F_TEST shall detect if a lock by another process is present on the specified section.

F_LOCK and F_TLOCK shall both lock a section of a file if the section is available.

F_ULOCK shall remove locks from a section of the file.

The *size* argument is the number of contiguous bytes to be locked or unlocked. The section to be locked or unlocked starts at the current offset in the file and extends forward for a positive size or backward for a negative size (the preceding bytes up to but not including the current offset). If *size* is 0, the section from the current offset through the largest possible file offset shall be locked (that is, from the current offset through the present or any future end-of-file). An area need not be allocated to the file to be locked because locks may exist past the end-of-file.

The sections locked with F_LOCK or F_TLOCK may, in whole or in part, contain or be contained by a previously locked section for the same process. When this occurs, or if adjacent locked sections would occur, the sections shall be combined into a single locked section. If the request would cause the number of locks to exceed a system-imposed limit, the request shall fail.

F_LOCK and F_TLOCK requests differ only by the action taken if the section is not available. F_LOCK shall block the calling thread until the section is available. F_TLOCK shall cause the function to fail if the section is already locked by another process.

File locks shall be released on first close by the locking process of any file descriptor for the file.

F_ULOCK requests may release (wholly or in part) one or more locked sections controlled by the process. Locked sections shall be unlocked starting at the current file offset through *size* bytes or to the end-of-file if *size* is (**off_t**)0. When all of a locked section is not released (that is, when the beginning or end of the area to be unlocked falls within a locked section), the remaining portions of that section shall remain locked by the process. Releasing the center portion of a locked section shall cause the remaining locked beginning and end portions to become two separate

locked sections. If the request would cause the number of locks in the system to exceed a system-imposed limit, the request shall fail.

A potential for deadlock occurs if the threads of a process controlling a locked section are blocked by accessing a locked section of another process. If the system detects that deadlock would occur, *lockf*( ) shall fail with an [EDEADLK] error.

The interaction between *fcntl*( ) and *lockf*( ) locks is unspecified.

Blocking on a section shall be interrupted by any signal.

An F_ULOCK request in which *size* is non-zero and the offset of the last byte of the requested section is the maximum value for an object of type **off_t**, when the process has an existing lock in which *size* is 0 and which includes the last byte of the requested section, shall be treated as a request to unlock from the start of the requested section with a size equal to 0. Otherwise, an F_ULOCK request shall attempt to unlock only the requested section.

Attempting to lock a section of a file that is associated with a buffered stream produces unspecified results.

RETURN VALUE

Upon successful completion, *lockf*( ) shall return 0. Otherwise, it shall return −1, set *errno* to indicate an error, and existing locks shall not be changed.

ERRORS

The *lockf*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid open file descriptor; or *function* is F_LOCK or F_TLOCK and *fildes* is not a valid file descriptor open for writing.

[EACCES] or [EAGAIN]
The *function* argument is F_TLOCK or F_TEST and the section is already locked by another process.

[EDEADLK] The *function* argument is F_LOCK and a deadlock is detected.

[EINTR] A signal was caught during execution of the function.

[EINVAL] The *function* argument is not one of F_LOCK, F_TLOCK, F_TEST, or F_ULOCK; or *size* plus the current file offset is less than 0.

[EOVERFLOW] The offset of the first, or if *size* is not 0 then the last, byte in the requested section cannot be represented correctly in an object of type **off_t**.

The *lockf*( ) function may fail if:

[EAGAIN] The *function* argument is F_LOCK or F_TLOCK and the file is mapped with *mmap*( ).

[EDEADLK] or [ENOLCK]
The *function* argument is F_LOCK, F_TLOCK, or F_ULOCK, and the request would cause the number of locks to exceed a system-imposed limit.

[EOPNOTSUPP] or [EINVAL]
The implementation does not support the locking of files of the type indicated by the *fildes* argument.

EXAMPLES

Locking a Portion of a File

In the following example, a file named **/home/cnd/mod1** is being modified. Other processes that use locking are prevented from changing it during this process. Only the first 10 000 bytes are locked, and the lock call fails if another process has any part of this area locked already.

```
#include <fcntl.h>
#include <unistd.h>

int fildes;
int status;
...
fildes = open("/home/cnd/mod1", O_RDWR);
status = lockf(fildes, F_TLOCK, (off_t)10000);
```

APPLICATION USAGE

Record-locking should not be used in combination with the *fopen*( ), *fread*( ), *fwrite*( ), and other *stdio* functions. Instead, the more primitive, non-buffered functions (such as *open*( )) should be used. Unexpected results may occur in processes that do buffering in the user address space. The process may later read/write data which is/was locked. The *stdio* functions are the most common source of unexpected buffering.

The *alarm*( ) function may be used to provide a timeout facility in applications requiring it.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<unistd.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Large File Summit extensions are added. In particular, the description of [EINVAL] is clarified and moved from optional to mandatory status.

A note is added to the DESCRIPTION indicating the effects of attempting to lock a section of a file that is associated with a buffered stream.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #054 is applied, updating the DESCRIPTION.

42455 **NAME**

42456 log, logf, logl ‡'natural logarithm function

42457 **SYNOPSIS**

42458
```
#include <math.h>
```

42459
```
double log(double x);
```
42460
```
float logf(float x);
```
42461
```
long double logl(long double x);
```

42462 **DESCRIPTION**

42463 CX The functionality described on this reference page is aligned with the ISO C standard. Any
42464 conflict between the requirements described here and the ISO C standard is unintentional. This
42465 volume of POSIX.1-2017 defers to the ISO C standard.

42466 These functions shall compute the natural logarithm of their argument x, $\log_e(x)$.

42467 An application wishing to check for error situations should set *errno* to zero and call
42468 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
42469 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
42470 zero, an error has occurred.

42471 **RETURN VALUE**

42472 Upon successful completion, these functions shall return the natural logarithm of x.

42473 If x is ±0, a pole error shall occur and *log*( ), *logf*( ), and *logl*( ) shall return –HUGE_VAL,
42474 –HUGE_VALF, and –HUGE_VALL, respectively.

42475 MX For finite values of x that are less than 0, or if x is –Inf, a domain error shall occur, and either a
42476 NaN (if supported), or an implementation-defined value shall be returned.

42477 MX If x is NaN, a NaN shall be returned.

42478 If x is 1, +0 shall be returned.

42479 If x is +Inf, x shall be returned.

42480 **ERRORS**

42481 These functions shall fail if:

42482 MX Domain Error The finite value of x is negative, or x is –Inf.

42483 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
42484 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
42485 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
42486 shall be raised.

42487 Pole Error The value of x is zero.

42488 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
42489 then *errno* shall be set to [ERANGE]. If the integer expression
42490 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
42491 floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.20 (on page 117), **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

The *logf*( ) and *logl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

log10, log10f, log10l ‡ base 10 logarithm function

SYNOPSIS

```
#include <math.h>

double log10(double x);
float log10f(float x);
long double log10l(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall compute the base 10 logarithm of their argument x, $\log_{10}(x)$.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the base 10 logarithm of x.

If x is ±0, a pole error shall occur and *log10*( ), *log10f*( ), and *log10l*( ) shall return –HUGE_VAL, –HUGE_VALF, and –HUGE_VALL, respectively.

MX For finite values of x that are less than 0, or if x is –Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

MX If x is NaN, a NaN shall be returned.

If x is 1, +0 shall be returned.

If x is +Inf, +Inf shall be returned.

ERRORS

These functions shall fail if:

MX Domain Error — The finite value of x is negative, or x is –Inf.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

Pole Error — The value of x is zero.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.20 (on page 117), **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

The *log10f*( ) and *log10l*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

log1p, log1pf, log1pl ‡'compute a natural logarithm

SYNOPSIS

```
#include <math.h>

double log1p(double x);
float log1pf(float x);
long double log1pl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall compute $\log_e(1.0 + x)$.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the natural logarithm of 1.0 + *x*.

If *x* is –1, a pole error shall occur and *log1p*( ), *log1pf*( ), and *log1pl*( ) shall return –HUGE_VAL, –HUGE_VALF, and –HUGE_VALL, respectively.

MX For finite values of *x* that are less than –1, or if *x* is –Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, or +Inf, *x* shall be returned.

If *x* is subnormal, a range error may occur
MXX and *x* should be returned.

MX If *x* is not returned, *log1p*( ), *log1pf*( ), and *log1pl*( ) shall return an implementation-defined value no greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

ERRORS

These functions shall fail if:

MX Domain Error — The finite value of *x* is less than –1, or *x* is –Inf.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

Pole Error — The value of *x* is –1.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised.

These functions may fail if:

MX Range Error — The value of *x* is subnormal.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

The *log1p*( ) function is no longer marked as an extension.

The *log1pf*( ) and *log1pl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0364 [68] is applied.

42651 **NAME**

42652 log2, log2f, log2l ‡'compute base 2 logarithm functions

42653 **SYNOPSIS**

42654
```
#include <math.h>
```

42655
```
double log2(double x);
```
42656
```
float log2f(float x);
```
42657
```
long double log2l(long double x);
```

42658 **DESCRIPTION**

42659 CX The functionality described on this reference page is aligned with the ISO C standard. Any
42660 conflict between the requirements described here and the ISO C standard is unintentional. This
42661 volume of POSIX.1-2017 defers to the ISO C standard.

42662 These functions shall compute the base 2 logarithm of their argument x, $\log_2(x)$.

42663 An application wishing to check for error situations should set *errno* to zero and call
42664 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
42665 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
42666 zero, an error has occurred.

42667 **RETURN VALUE**

42668 Upon successful completion, these functions shall return the base 2 logarithm of x.

42669 If x is ±0, a pole error shall occur and *log2*( ), *log2f*( ), and *log2l*( ) shall return –HUGE_VAL,
42670 –HUGE_VALF, and –HUGE_VALL, respectively.

42671 MX For finite values of x that are less than 0, or if x is –Inf, a domain error shall occur, and either a
42672 NaN (if supported), or an implementation-defined value shall be returned.

42673 MX If x is NaN, a NaN shall be returned.

42674 If x is 1, +0 shall be returned.

42675 If x is +Inf, x shall be returned.

42676 **ERRORS**

42677 These functions shall fail if:

42678 MX Domain Error The finite value of x is less than zero, or x is –Inf.

42679 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
42680 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
42681 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
42682 shall be raised.

42683 Pole Error The value of x is zero.

42684 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
42685 then *errno* shall be set to [ERANGE]. If the integer expression
42686 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
42687 floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

feclearexcept( ), *fetestexcept( )*, *log( )*

XBD Section 4.20 (on page 117), **<math.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

42702 **NAME**

42703 logb, logbf, logbl ‡'radix-independent exponent

42704 **SYNOPSIS**

42705
```
#include <math.h>
```

42706
```
double logb(double x);
```
42707
```
float logbf(float x);
```
42708
```
long double logbl(long double x);
```

42709 **DESCRIPTION**

42710 CX The functionality described on this reference page is aligned with the ISO C standard. Any
42711 conflict between the requirements described here and the ISO C standard is unintentional. This
42712 volume of POSIX.1-2017 defers to the ISO C standard.

42713 These functions shall compute the exponent of x, which is the integral part of $\log_r |x|$, as a
42714 signed floating-point value, for non-zero x, where r is the radix of the machine's floating-point
42715 arithmetic, which is the value of FLT_RADIX defined in the **<float.h>** header.

42716 If x is subnormal it is treated as though it were normalized; thus for finite positive x:

42717
```
1 <= x * FLT_RADIX^-logb(x) < FLT_RADIX
```

42718 An application wishing to check for error situations should set *errno* to zero and call
42719 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
42720 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
42721 zero, an error has occurred.

42722 **RETURN VALUE**

42723 Upon successful completion, these functions shall return the exponent of x.

42724 If x is ±0, *logb*(), *logbf*(), and *logbl*() shall return –HUGE_VAL, –HUGE_VALF, and
42725 –HUGE_VALL, respectively.

42726 MX On systems that support the IEC 60559 Floating-Point option, a pole error shall occur;
42727 CX otherwise, a pole error may occur.

42728 MX If x is NaN, a NaN shall be returned.

42729 MX If x is ±Inf, +Inf shall be returned.

42730 **ERRORS**

42731 These functions shall fail if:

42732 MX Pole Error The value of x is ±0.

42733 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
42734 then *errno* shall be set to [ERANGE]. If the integer expression
42735 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
42736 floating-point exception shall be raised.

42737 These functions may fail if:

42738 Pole Error The value of x is 0.

42739 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
42740 then *errno* shall be set to [ERANGE]. If the integer expression
42741 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
42742 floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

42774 **DESCRIPTION**

42775 Refer to *log*( ).

NAME

longjmp ‡'non-local goto

SYNOPSIS

```
#include <setjmp.h>

void longjmp(jmp_buf env, int val);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *longjmp*( ) function shall restore the environment saved by the most recent invocation of *setjmp*( ) in the same process, with the corresponding **jmp_buf** argument. If the most recent invocation of *setjmp*( ) with the corresponding **jmp_buf** occurred in another thread, or if there is no such invocation, or if the function containing the invocation of *setjmp*( ) has terminated execution in the interim, or if the invocation of *setjmp*( ) was within the scope of an identifier with variably modified type and execution has left that scope in the interim, the behavior is undefined. CX It is unspecified whether *longjmp*( ) restores the signal mask, leaves the signal mask unchanged, or restores it to its value at the time *setjmp*( ) was called.

All accessible objects have values, and all other components of the abstract machine have state (for example, floating-point status flags and open files), as of the time *longjmp*( ) was called, except that the values of objects of automatic storage duration are unspecified if they meet all the following conditions:

- They are local to the function containing the corresponding *setjmp*( ) invocation.
- They do not have volatile-qualified type.
- They are changed between the *setjmp*( ) invocation and *longjmp*( ) call.

CX Although *longjmp*( ) is an async-signal-safe function, if it is invoked from a signal handler which interrupted a non-async-signal-safe function or equivalent (such as the processing equivalent to *exit*( ) performed after a return from the initial call to *main*( )), the behavior of any subsequent call to a non-async-signal-safe function or equivalent is undefined.

The effect of a call to *longjmp*( ) where initialization of the **jmp_buf** structure was not performed in the calling thread is undefined.

RETURN VALUE

After *longjmp*( ) is completed, program execution continues as if the corresponding invocation of *setjmp*( ) had just returned the value specified by *val*. The *longjmp*( ) function shall not cause *setjmp*( ) to return 0; if *val* is 0, *setjmp*( ) shall return 1.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Applications whose behavior depends on the value of the signal mask should not use *longjmp*( ) and *setjmp*( ), since their effect on the signal mask is unspecified, but should instead use the *siglongjmp*( ) and *sigsetjmp*( ) functions (which can save and restore the signal mask under application control).

It is recommended that applications do not call *longjmp*( ) or *siglongjmp*( ) from signal handlers. To avoid undefined behavior when calling these functions from a signal handler, the application

needs to ensure one of the following two things:

1. After the call to *longjmp*( ) or *siglongjmp*( ) the process only calls async-signal-safe functions and does not return from the initial call to *main*( ).
2. Any signal whose handler calls *longjmp*( ) or *siglongjmp*( ) is blocked during *every* call to a non-async-signal-safe function, and no such calls are made after returning from the initial call to *main*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

> The DESCRIPTION now explicitly makes *longjmp*( )'s effect on the signal mask unspecified.

The DESCRIPTION is updated for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0365 [394] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0202 [516] is applied.

NAME

lrand48 ‡'generate uniformly distributed pseudo-random non-negative long integers

SYNOPSIS

XSI
```
#include <stdlib.h>

long lrand48(void);
```

DESCRIPTION

Refer to *drand48( )*.

NAME

lrint, lrintf, lrintl — round to nearest integer value using current rounding direction

SYNOPSIS

```
#include <math.h>

long lrint(double x);
long lrintf(float x);
long lrintl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall round their argument to the nearest integer value, rounding according to the current rounding direction.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the rounded integer value.

MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.

If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

If *x* is –Inf, a domain error shall occur and an unspecified value is returned.

If the correct value is positive and too large to represent as a **long**, an unspecified value shall be returned. MX On systems that support the IEC 60559 Floating-Point option, a domain error shall occur; CX otherwise, a domain error may occur.

If the correct value is negative and too large to represent as a **long**, an unspecified value shall be returned. MX On systems that support the IEC 60559 Floating-Point option, a domain error shall occur; CX otherwise, a domain error may occur.

ERRORS

These functions shall fail if:

MX

Domain Error — The *x* argument is NaN or ±Inf, or the correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Domain Error — The correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions provide floating-to-integer conversions. They round according to the current rounding direction. If the rounded value is outside the range of the return type, the numeric result is unspecified and the invalid floating-point exception is raised. When they raise no other floating-point exception and the result differs from the argument, they raise the inexact floating-point exception.

FUTURE DIRECTIONS

None.

SEE ALSO

feclearexcept( ), *fetestexcept( )*, *llrint( )*

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

Issue 7

ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #53 (SD5-XSH-ERN-77) is applied.

NAME

lround, lroundf, lroundl — round to nearest integer value

SYNOPSIS

```
#include <math.h>

long lround(double x);
long lroundf(float x);
long lroundl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall round their argument to the nearest integer value, rounding halfway cases away from zero, regardless of the current rounding direction.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the rounded integer value.

MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.

If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

If *x* is –Inf, a domain error shall occur and an unspecified value is returned.

If the correct value is positive and too large to represent as a **long**, an unspecified value shall be returned. MX On systems that support the IEC 60559 Floating-Point option, a domain shall occur; CX otherwise, a domain error may occur.

If the correct value is negative and too large to represent as a **long**, an unspecified value shall be returned. MX On systems that support the IEC 60559 Floating-Point option, a domain shall occur; CX otherwise, a domain error may occur.

ERRORS

These functions shall fail if:

MX

Domain Error — The *x* argument is NaN or ±Inf, or the correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Domain Error — The correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions differ from the *lrint*( ) functions in the default rounding direction, with the *lround*( ) functions rounding halfway cases away from zero and needing not to raise the inexact floating-point exception for non-integer arguments that round to within the range of the return type.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

Issue 7

ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #54 (SD5-XSH-ERN-78) is applied.

NAME

lsearch, lfind — linear search and update

SYNOPSIS

XSI

```
#include <search.h>

void *lsearch(const void *key, void *base, size_t *nelp, size_t width,
    int (*compar)(const void *, const void *));
void *lfind(const void *key, const void *base, size_t *nelp,
    size_t width, int (*compar)(const void *, const void *));
```

DESCRIPTION

The *lsearch*( ) function shall linearly search the table and return a pointer into the table for the matching entry. If the entry does not occur, it shall be added at the end of the table. The *key* argument points to the entry to be sought in the table. The *base* argument points to the first element in the table. The *width* argument is the size of an element in bytes. The *nelp* argument points to an integer containing the current number of elements in the table. The integer to which *nelp* points shall be incremented if the entry is added to the table. The *compar* argument points to a comparison function which the application shall supply (for example, *strcmp*( )). It is called with two arguments that point to the elements being compared. The application shall ensure that the function returns 0 if the elements are equal, and non-zero otherwise.

The *lfind*( ) function shall be equivalent to *lsearch*( ), except that if the entry is not found, it is not added to the table. Instead, a null pointer is returned.

RETURN VALUE

If the searched for entry is found, both *lsearch*( ) and *lfind*( ) shall return a pointer to it. Otherwise, *lfind*( ) shall return a null pointer and *lsearch*( ) shall return a pointer to the newly added element.

Both functions shall return a null pointer in case of error.

ERRORS

No errors are defined.

EXAMPLES

Storing Strings in a Table

This fragment reads in less than or equal to TABSIZE strings of length less than or equal to ELSIZE and stores them in a table, eliminating duplicates.

```
#include <stdio.h>
#include <string.h>
#include <search.h>

#define TABSIZE 50
#define ELSIZE 120

...
    char line[ELSIZE], tab[TABSIZE][ELSIZE];
    size_t nel = 0;
    ...
    while (fgets(line, ELSIZE, stdin) != NULL && nel < TABSIZE)
        (void) lsearch(line, tab, &nel,
            ELSIZE, (int (*)(const void *, const void *)) strcmp);
    ...
```

Finding a Matching Entry

The following example finds any line that reads "This is a test.".

```
#include <search.h>
#include <string.h>
...
char line[ELSIZE], tab[TABSIZE][ELSIZE];
size_t nel = 0;
char *findline;
void *entry;

findline = "This is a test.\n";

entry = lfind(findline, tab, &nel, ELSIZE, (
    int (*)(const void *, const void *)) strcmp);
```

APPLICATION USAGE

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

Undefined results can occur if there is not enough room in the table to add a new item.

RATIONALE

None.

FUTURE DIRECTIONS

None.

The normative text is updated to avoid use of the term ``must'' for application requirements.

43049 **NAME**

43050 lseek — move the read/write file offset

43051 **SYNOPSIS**

43052 `#include <unistd.h>`

43053 `off_t lseek(int fildes, off_t offset, int whence);`

43054 **DESCRIPTION**

43055 The *lseek*( ) function shall set the file offset for the open file description associated with the file
43056 descriptor *fildes*, as follows:

43057 If *whence* is SEEK_SET, the file offset shall be set to *offset* bytes.

43058 If *whence* is SEEK_CUR, the file offset shall be set to its current location plus *offset*.

43059 If *whence* is SEEK_END, the file offset shall be set to the size of the file plus *offset*.

43060 The symbolic constants SEEK_SET, SEEK_CUR, and SEEK_END are defined in **<unistd.h>**.

43061 The behavior of *lseek*( ) on devices which are incapable of seeking is implementation-defined.
43062 The value of the file offset associated with such a device is undefined.

43063 The *lseek*( ) function shall allow the file offset to be set beyond the end of the existing data in the
43064 file. If data is later written at this point, subsequent reads of data in the gap shall return bytes
43065 with the value 0 until data is actually written into the gap.

43066 The *lseek*( ) function shall not, by itself, extend the size of a file.

43067 SHM If *fildes* refers to a shared memory object, the result of the *lseek*( ) function is unspecified.

43068 TYM If *fildes* refers to a typed memory object, the result of the *lseek*( ) function is unspecified.

43069 **RETURN VALUE**

43070 Upon successful completion, the resulting offset, as measured in bytes from the beginning of the
43071 file, shall be returned. Otherwise, −1 shall be returned, *errno* shall be set to indicate the error, and
43072 the file offset shall remain unchanged.

43073 **ERRORS**

43074 The *lseek*( ) function shall fail if:

43075 [EBADF] The *fildes* argument is not an open file descriptor.

43076 [EINVAL] The *whence* argument is not a proper value, or the resulting file offset would
43077 be negative for a regular file, block special file, or directory.

43078 [EOVERFLOW] The resulting file offset would be a value which cannot be represented
43079 correctly in an object of type **off_t**.

43080 [ESPIPE] The *fildes* argument is associated with a pipe, FIFO, or socket.

43081 **EXAMPLES**

43082 None.

43083 **APPLICATION USAGE**

43084 None.

43085 **RATIONALE**

43086 The ISO C standard includes the functions *fgetpos*( ) and *fsetpos*( ), which work on very large files
43087 by use of a special positioning type.

43088 Although *lseek*( ) may position the file offset beyond the end of the file, this function does not
43089 itself extend the size of the file. While the only function in POSIX.1-2017 that may directly extend

the size of the file is *write*( ), *truncate*( ), and *ftruncate*( ), several functions originally derived from the ISO C standard, such as *fwrite*( ), *fprintf*( ), and so on, may do so (by causing calls on *write*( )).

An invalid file offset that would cause [EINVAL] to be returned may be both implementation-defined and device-dependent (for example, memory may have few invalid values). A negative file offset may be valid for some devices in some implementations.

The POSIX.1-1990 standard did not specifically prohibit *lseek*( ) from returning a negative offset. Therefore, an application was required to clear *errno* prior to the call and check *errno* upon return to determine whether a return value of (**off_t**)−1 is a negative offset or an indication of an error condition. The standard developers did not wish to require this action on the part of a conforming application, and chose to require that *errno* be set to [EINVAL] when the resulting file offset would be negative for a regular file, block special file, or directory.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

> The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
>
> The [EOVERFLOW] error condition is added. This change is to support large files.

An additional [ESPIPE] error condition is added for sockets.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *lseek*( ) results are unspecified for typed memory objects.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0366 [421] is applied.

43124 **NAME**

43125 lstat ‡ get file status

43126 **SYNOPSIS**

43127 `#include <sys/stat.h>`

43128 `int lstat(const char *restrict path, struct stat *restrict buf);`

43129 **DESCRIPTION**

43130 Refer to *fstatat*( ).

NAME

malloc ‡'a memory allocator

SYNOPSIS

```
#include <stdlib.h>

void *malloc(size_t size);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *malloc*( ) function shall allocate unused space for an object whose size in bytes is specified by *size* and whose value is unspecified.

The order and contiguity of storage allocated by successive calls to *malloc*( ) is unspecified. The pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to a pointer to any type of object and then used to access such an object in the space allocated (until the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object disjoint from any other object. The pointer returned points to the start (lowest byte address) of the allocated space. If the space cannot be allocated, a null pointer shall be returned. If the size of the space requested is 0, the behavior is implementation-defined: either a null pointer shall be returned, or the behavior shall be as if the size were some non-zero value, except that the behavior is undefined if the returned pointer is used to access an object.

RETURN VALUE

Upon successful completion with *size* not equal to 0, *malloc*( ) shall return a pointer to the allocated space. If *size* is 0, either:

CX A null pointer shall be returned and *errno* may be set to an implementation-defined value, or

A pointer to the allocated space shall be returned. The application shall ensure that the pointer is not used to access an object.

CX Otherwise, it shall return a null pointer and set *errno* to indicate the error.

ERRORS

The *malloc*( ) function shall fail if:

CX [ENOMEM] Insufficient storage space is available.

NAME

mblen ‡'get number of bytes in a character

SYNOPSIS

```
#include <stdlib.h>

int mblen(const char *s, size_t n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

If *s* is not a null pointer, *mblen*( ) shall determine the number of bytes constituting the character pointed to by *s*. Except that the shift state of *mbtowc*( ) is not affected, it shall be equivalent to:

```
mbtowc((wchar_t *)0, s, n);
```

The implementation shall behave as if no function defined in this volume of POSIX.1-2017 calls *mblen*( ).

The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a state-dependent encoding, this function shall be placed into its initial state by a call for which its character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a null pointer shall cause this function to return a non-zero value if encodings have state dependency, and 0 otherwise. If the implementation employs special bytes to change the shift state, these bytes shall not produce separate wide-character codes, but shall be grouped with an adjacent character. Changing the *LC_CTYPE* category causes the shift state of this function to be unspecified.

CX The *mblen*( ) function need not be thread-safe.

RETURN VALUE

If *s* is a null pointer, *mblen*( ) shall return a non-zero or 0 value, if character encodings, respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mblen*( ) shall either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the character (if the next *n* or fewer bytes form a valid character), or return −1 (if they do not form a CX valid character) and may set *errno* to indicate the error. In no case shall the value returned be greater than *n* or the value of the {MB_CUR_MAX} macro.

ERRORS

The *mblen*( ) function may fail if:

CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ] error cannot occur since all byte values are valid characters.

EXAMPLES

None.

APPLICATION USAGE

None.

NAME

mbrlen — get number of bytes in a character (restartable)

SYNOPSIS

```
#include <wchar.h>

size_t mbrlen(const char *restrict s, size_t n,
    mbstate_t *restrict ps);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

If *s* is not a null pointer, *mbrlen*( ) shall determine the number of bytes constituting the character pointed to by *s*. It shall be equivalent to:

```
mbstate_t internal;
mbrtowc(NULL, s, n, ps != NULL ? ps : &internal);
```

If *ps* is a null pointer, the *mbrlen*( ) function shall use its own internal **mbstate_t** object, which is initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object pointed to by *ps* shall be used to completely describe the current conversion state of the associated character sequence. The implementation shall behave as if no function defined in this volume of POSIX.1-2017 calls *mbrlen*( ).

The behavior of this function is affected by the *LC_CTYPE* category of the current locale.

CX The *mbrlen*( ) function need not be thread-safe if called with a NULL *ps* argument.

The *mbrlen*( ) function shall not change the setting of *errno* if successful.

RETURN VALUE

The *mbrlen*( ) function shall return the first of the following that applies:

0 If the next *n* or fewer bytes complete the character that corresponds to the null wide character.

positive If the next *n* or fewer bytes complete a valid character; the value returned shall be the number of bytes that complete the character.

(**size_t**)–2 If the next *n* bytes contribute to an incomplete but potentially valid character, and all *n* bytes have been processed. When *n* has at least the value of the {MB_CUR_MAX} macro, this case can only occur if *s* points at a sequence of redundant shift sequences (for implementations with state-dependent encodings).

(**size_t**)–1 If an encoding error occurs, in which case the next *n* or fewer bytes do not contribute to a complete and valid character. In this case, [EILSEQ] shall be stored in *errno* and the conversion state is undefined.

ERRORS

The *mbrlen*( ) function shall fail if:

CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ] error cannot occur since all byte values are valid characters.

The *mbrlen*( ) function may fail if:

[EINVAL] *ps* points to an object that contains an invalid conversion state.

NAME

mbrtowc — convert a character to a wide-character code (restartable)

SYNOPSIS

```
#include <wchar.h>

size_t mbrtowc(wchar_t *restrict pwc, const char *restrict s,
    size_t n, mbstate_t *restrict ps);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

If *s* is a null pointer, the *mbrtowc*( ) function shall be equivalent to the call:

```
mbrtowc(NULL, "", 1, ps)
```

In this case, the values of the arguments *pwc* and *n* are ignored.

If *s* is not a null pointer, the *mbrtowc*( ) function shall inspect at most *n* bytes beginning at the byte pointed to by *s* to determine the number of bytes needed to complete the next character (including any shift sequences). If the function determines that the next character is completed, it shall determine the value of the corresponding wide character and then, if *pwc* is not a null pointer, shall store that value in the object pointed to by *pwc*. If the corresponding wide character is the null wide character, the resulting state described shall be the initial conversion state.

If *ps* is a null pointer, the *mbrtowc*( ) function shall use its own internal **mbstate_t** object, which shall be initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object pointed to by *ps* shall be used to completely describe the current conversion state of the associated character sequence. The implementation shall behave as if no function defined in this volume of POSIX.1-2017 calls *mbrtowc*( ).

The behavior of this function is affected by the *LC_CTYPE* category of the current locale.

CX The *mbrtowc*( ) function need not be thread-safe if called with a NULL *ps* argument.

The *mbrtowc*( ) function shall not change the setting of *errno* if successful.

RETURN VALUE

The *mbrtowc*( ) function shall return the first of the following that applies:

0 If the next *n* or fewer bytes complete the character that corresponds to the null wide character (which is the value stored).

between 1 and *n* inclusive
If the next *n* or fewer bytes complete a valid character (which is the value stored); the value returned shall be the number of bytes that complete the character.

(**size_t**)–2 If the next *n* bytes contribute to an incomplete but potentially valid character, and all *n* bytes have been processed (no value is stored). When *n* has at least the value of the {MB_CUR_MAX} macro, this case can only occur if *s* points at a sequence of redundant shift sequences (for implementations with state-dependent encodings).

(**size_t**)–1 If an encoding error occurs, in which case the next *n* or fewer bytes do not contribute to a complete and valid character (no value is stored). In this case, [EILSEQ] shall be stored in *errno* and the conversion state is undefined.

ERRORS

The *mbrtowc*( ) function shall fail if:

CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ] error cannot occur since all byte values are valid characters.

The *mbrtowc*( ) function may fail if:

CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

NAME

mbsinit ‡'determine conversion object status

SYNOPSIS

```
#include <wchar.h>

int mbsinit(const mbstate_t *ps);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

If *ps* is not a null pointer, the *mbsinit*( ) function shall determine whether the object pointed to by *ps* describes an initial conversion state.

RETURN VALUE

The *mbsinit*( ) function shall return non-zero if *ps* is a null pointer, or if the pointed-to object describes an initial conversion state; otherwise, it shall return zero.

If an **mbstate_t** object is altered by any of the functions described as ``restartable'', and is then used with a different character sequence, or in the other conversion direction, or with a different *LC_CTYPE* category setting than on earlier function calls, the behavior is undefined.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The **mbstate_t** object is used to describe the current conversion state from a particular character sequence to a wide-character sequence (or *vice versa*) under the rules of a particular setting of the *LC_CTYPE* category of the current locale.

The initial conversion state corresponds, for a conversion in either direction, to the beginning of a new character sequence in the initial shift state. A zero valued **mbstate_t** object is at least one way to describe an initial conversion state. A zero valued **mbstate_t** object can be used to initiate conversion involving any character sequence, in any *LC_CTYPE* category setting.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

mbsnrtowcs, mbsrtowcs — convert a character string to a wide-character string (restartable)

SYNOPSIS

```
#include <wchar.h>

CX  size_t mbsnrtowcs(wchar_t *restrict dst, const char **restrict src,
        size_t nmc, size_t len, mbstate_t *restrict ps);
    size_t mbsrtowcs(wchar_t *restrict dst, const char **restrict src,
        size_t len, mbstate_t *restrict ps);
```

DESCRIPTION

CX For *mbsrtowcs*(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *mbsrtowcs*() function shall convert a sequence of characters, beginning in the conversion state described by the object pointed to by *ps*, from the array indirectly pointed to by *src* into a sequence of corresponding wide characters. If *dst* is not a null pointer, the converted characters shall be stored into the array pointed to by *dst*. Conversion continues up to and including a terminating null character, which shall also be stored. Conversion shall stop early in either of the following cases:

- A sequence of bytes is encountered that does not form a valid character.
- *len* codes have been stored into the array pointed to by *dst* (and *dst* is not a null pointer).

Each conversion shall take place as if by a call to the *mbrtowc*() function.

If *dst* is not a null pointer, the pointer object pointed to by *src* shall be assigned either a null pointer (if conversion stopped due to reaching a terminating null character) or the address just past the last character converted (if any). If conversion stopped due to reaching a terminating null character, and if *dst* is not a null pointer, the resulting state described shall be the initial conversion state.

If *ps* is a null pointer, the *mbsrtowcs*() function shall use its own internal **mbstate_t** object, which is initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object pointed to by *ps* shall be used to completely describe the current conversion state of the associated character sequence.

CX The *mbsnrtowcs*() function shall be equivalent to the *mbsrtowcs*() function, except that the conversion of characters indirectly pointed to by *src* is limited to at most *nmc* bytes (the size of the input buffer), and under conditions where *mbsrtowcs*() would assign the address just past the last character converted (if any) to the pointer object pointed to by *src*, *mbsnrtowcs*() shall instead assign the address just past the last byte processed (if any) to that pointer object. If the input buffer ends with an incomplete character, it is unspecified whether conversion stops at the end of the previous character (if any), or at the end of the input buffer. In the latter case, a subsequent call to *mbsnrtowcs*() with an input buffer that starts with the remainder of the incomplete character shall correctly complete the conversion of that character.

The behavior of these functions shall be affected by the *LC_CTYPE* category of the current locale.

The implementation shall behave as if no function defined in this volume of POSIX.1-2017 calls these functions.

CX The *mbsnrtowcs*() and *mbsrtowcs*() functions need not be thread-safe if called with a NULL *ps* argument.

The *mbsrtowcs*() function shall not change the setting of *errno* if successful.

RETURN VALUE

If the input conversion encounters a sequence of bytes that do not form a valid character, an encoding error occurs. In this case, these functions shall store the value of the macro [EILSEQ] in *errno* and shall return (**size_t**)–1; the conversion state is undefined. Otherwise, these functions shall return the number of characters successfully converted, not including the terminating null (if any).

ERRORS

These functions shall fail if:

CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ] error cannot occur since all byte values are valid characters.

These functions may fail if:

CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

A future version may require that when the input buffer ends with an incomplete character, conversion stops at the end of the input buffer.

NAME

mbstowcs ‡'convert a character string to a wide-character string

SYNOPSIS

```
#include <stdlib.h>

size_t mbstowcs(wchar_t *restrict pwcs, const char *restrict s,
    size_t n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *mbstowcs*( ) function shall convert a sequence of characters that begins in the initial shift state from the array pointed to by *s* into a sequence of corresponding wide-character codes and shall store not more than *n* wide-character codes into the array pointed to by *pwcs*. No characters that follow a null byte (which is converted into a wide-character code with value 0) shall be examined or converted. Each character shall be converted as if by a call to *mbtowc*( ), except that the shift state of *mbtowc*( ) is not affected.

No more than *n* elements shall be modified in the array pointed to by *pwcs*. If copying takes place between objects that overlap, the behavior is undefined.

XSI The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale. If *pwcs* is a null pointer, *mbstowcs*( ) shall return the length required to convert the entire array regardless of the value of *n*, but no values are stored.

RETURN VALUE

CX If an invalid character is encountered, *mbstowcs*( ) shall return (**size_t**)–1 and shall set *errno* to indicate the error.

XSI Otherwise, *mbstowcs*( ) shall return the number of the array elements modified (or required if *pwcs* is null), not including a terminating 0 code, if any. The array shall not be zero-terminated if the value returned is *n*.

ERRORS

The *mbstowcs*( ) function shall fail if:

CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ] error cannot occur since all byte values are valid characters.

NAME

mbtowc ‡'convert a character to a wide-character code

SYNOPSIS

```
#include <stdlib.h>

int mbtowc(wchar_t *restrict pwc, const char *restrict s, size_t n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

If *s* is not a null pointer, *mbtowc*( ) shall determine the number of bytes that constitute the character pointed to by *s*. It shall then determine the wide-character code for the value of type **wchar_t** that corresponds to that character. (The value of the wide-character code corresponding to the null byte is 0.) If the character is valid and *pwc* is not a null pointer, *mbtowc*( ) shall store the wide-character code in the object pointed to by *pwc*.

The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a state-dependent encoding, this function is placed into its initial state by a call for which its character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a null pointer shall cause this function to return a non-zero value if encodings have state dependency, and 0 otherwise. If the implementation employs special bytes to change the shift state, these bytes shall not produce separate wide-character codes, but shall be grouped with an adjacent character. Changing the *LC_CTYPE* category causes the shift state of this function to be unspecified. At most *n* bytes of the array pointed to by *s* shall be examined.

The implementation shall behave as if no function defined in this volume of POSIX.1-2017 calls *mbtowc*( ).

CX The *mbtowc*( ) function need not be thread-safe.

RETURN VALUE

If *s* is a null pointer, *mbtowc*( ) shall return a non-zero or 0 value, if character encodings, respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mbtowc*( ) shall either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the converted character (if the next *n* or fewer bytes form a valid character), or return −1 CX and shall set *errno* to indicate the error (if they do not form a valid character).

In no case shall the value returned be greater than *n* or the value of the {MB_CUR_MAX} macro.

ERRORS

The *mbtowc*( ) function shall fail if:

CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ] error cannot occur since all byte values are valid characters.

43600 **NAME**

43601 memccpy ‡'copy bytes in memory

43602 **SYNOPSIS**

43603 XSI
```
#include <string.h>

void *memccpy(void *restrict s1, const void *restrict s2,
    int c, size_t n);
```

43606 **DESCRIPTION**

43607 The *memccpy*( ) function shall copy bytes from memory area *s2* into *s1*, stopping after the first
43608 occurrence of byte *c* (converted to an **unsigned char**) is copied, or after *n* bytes are copied,
43609 whichever comes first. If copying takes place between objects that overlap, the behavior is
43610 undefined.

43611 **RETURN VALUE**

43612 The *memccpy*( ) function shall return a pointer to the byte after the copy of *c* in *s1*, or a null
43613 pointer if *c* was not found in the first *n* bytes of *s2*.

43614 **ERRORS**

43615 No errors are defined.

43616 **EXAMPLES**

43617 None.

43618 **APPLICATION USAGE**

43619 The *memccpy*( ) function does not check for the overflow of the receiving memory area.

43620 **RATIONALE**

43621 None.

43622 **FUTURE DIRECTIONS**

43623 None.

43624 **SEE ALSO**

43626 **CHANGE HISTORY**

43627 First released in Issue 1. Derived from Issue 1 of the SVID.

43628 **Issue 6**

43629 The **restrict** keyword is added to the *memccpy*( ) prototype for alignment with the
43630 ISO/IEC 9899: 1999 standard.

NAME

memchr ‡'find byte in memory

SYNOPSIS

```
#include <string.h>

void *memchr(const void *s, int c, size_t n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *memchr*( ) function shall locate the first occurrence of *c* (converted to an **unsigned char**) in the initial *n* bytes (each interpreted as **unsigned char**) pointed to by *s*.

Implementations shall behave as if they read the memory byte by byte from the beginning of the bytes pointed to by *s* and stop at the first occurrence of *c* (if it is found in the initial *n* bytes).

RETURN VALUE

The *memchr*( ) function shall return a pointer to the located byte, or a null pointer if the byte is not found.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0374 [110] is applied.

43663 **NAME**

43664 memcmp ‡ compare bytes in memory

43665 **SYNOPSIS**

43666 `#include <string.h>`

43667 `int memcmp(const void *s1, const void *s2, size_t n);`

43668 **DESCRIPTION**

43669 CX The functionality described on this reference page is aligned with the ISO C standard. Any
43670 conflict between the requirements described here and the ISO C standard is unintentional. This
43671 volume of POSIX.1-2017 defers to the ISO C standard.

43672 The *memcmp*( ) function shall compare the first *n* bytes (each interpreted as **unsigned char**) of the
43673 object pointed to by *s1* to the first *n* bytes of the object pointed to by *s2*.

43674 The sign of a non-zero return value shall be determined by the sign of the difference between the
43675 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the objects
43676 being compared.

43677 **RETURN VALUE**

43678 The *memcmp*( ) function shall return an integer greater than, equal to, or less than 0, if the object
43679 pointed to by *s1* is greater than, equal to, or less than the object pointed to by *s2*, respectively.

43680 **ERRORS**

43681 No errors are defined.

43682 **EXAMPLES**

43683 None.

43684 **APPLICATION USAGE**

43685 None.

43686 **RATIONALE**

43687 None.

43688 **FUTURE DIRECTIONS**

43689 None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

NAME

mkdir, mkdirat — make a directory

SYNOPSIS

```
#include <sys/stat.h>

int mkdir(const char *path, mode_t mode);
```

OH
```
#include <fcntl.h>

int mkdirat(int fd, const char *path, mode_t mode);
```

DESCRIPTION

The *mkdir*( ) function shall create a new directory with name *path*. The file permission bits of the new directory shall be initialized from *mode*. These file permission bits of the *mode* argument shall be modified by the process' file creation mask.

When bits in *mode* other than the file permission bits are set, the meaning of these additional bits is implementation-defined.

The directory's user ID shall be set to the process' effective user ID. The directory's group ID shall be set to the group ID of the parent directory or to the effective group ID of the process. Implementations shall provide a way to initialize the directory's group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the directory's group ID to the effective group ID of the calling process.

The newly created directory shall be an empty directory.

If *path* names a symbolic link, *mkdir*( ) shall fail and set *errno* to [EEXIST].

Upon successful completion, *mkdir*( ) shall mark for update the last data access, last data modification, and last file status change timestamps of the directory. Also, the last data modification and last file status change timestamps of the directory that contains the new entry shall be marked for update.

The *mkdirat*( ) function shall be equivalent to the *mkdir*( ) function except in the case where *path* specifies a relative path. In this case the newly created directory is created relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the access mode of the open file description associated with the file descriptor is not O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the access mode is O_SEARCH, the function shall not perform the check.

If *mkdirat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working directory shall be used and the behavior shall be identical to a call to *mkdir*( ).

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return −1 and set *errno* to indicate the error. If −1 is returned, no directory shall be created.

ERRORS

These functions shall fail if:

[EACCES] Search permission is denied on a component of the path prefix, or write permission is denied on the parent directory of the directory to be created.

[EEXIST] The named file exists.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[EMLINK] The link count of the parent directory would exceed {LINK_MAX}.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of the path prefix specified by *path* does not name an existing directory or *path* is an empty string.

[ENOSPC] The file system does not contain enough space to hold the contents of the new directory or to extend the parent directory of the new directory.

[ENOTDIR] A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory.

[EROFS] The parent directory resides on a read-only file system.

In addition, the *mkdirat*( ) function shall fail if:

[EACCES] The access mode of the open file description associated with *fd* is not O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

[ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated with a non-directory file.

These functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

Creating a Directory

The following example shows how to create a directory named **/home/cnd/mod1**, with read/write/search permissions for owner and group, and with read/search permissions for others.

```
#include <sys/types.h>
#include <sys/stat.h>

int status;
...
status = mkdir("/home/cnd/mod1", S_IRWXU | S_IRWXG | S_IROTH | S_IXOTH);
```

APPLICATION USAGE

None.

RATIONALE

The *mkdir*( ) function originated in 4.2 BSD and was added to System V in Release 3.0.

4.3 BSD detects [ENAMETOOLONG].

The POSIX.1-1990 standard required that the group ID of a newly created directory be set to the

group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown*( ) to set the group ID after the directory is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *mkdirat*( ) function is to create a directory in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to the call to *mkdir*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *mkdirat*( ) function it can be guaranteed that the newly created directory is located relative to the desired directory.

FUTURE DIRECTIONS

None.

SEE ALSO

chmod( ), *mkdtemp*( ), *mknod*( ), *umask*( )

XBD **<fcntl.h>**, **<sys/stat.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *mkdirat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0375 [461], XSH/TC1-2008/0376 [324], XSH/TC1-2008/0377 [277], XSH/TC1-2008/0378 [278], and XSH/TC1-2008/0379 [278] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0210 [873], XSH/TC2-2008/0211 [591], XSH/TC2-2008/0212 [817], XSH/TC2-2008/0213 [817], and XSH/TC2-2008/0214 [591] are applied.

NAME

mkdtemp, mkstemp — create a unique directory or file

SYNOPSIS

CX
```
#include <stdlib.h>

char *mkdtemp(char *template);
int mkstemp(char *template);
```

DESCRIPTION

The *mkdtemp*( ) function shall create a directory with a unique name derived from *template*. The application shall ensure that the string provided in *template* is a pathname ending with at least six trailing 'X' characters. The *mkdtemp*( ) function shall modify the contents of *template* by replacing six or more 'X' characters at the end of the pathname with the same number of characters from the portable filename character set. The characters shall be chosen such that the resulting pathname does not duplicate the name of an existing file at the time of the call to *mkdtemp*( ). The *mkdtemp*( ) function shall use the resulting pathname to create the new directory as if by a call to:

```
mkdir(pathname, S_IRWXU)
```

The *mkstemp*( ) function shall create a regular file with a unique name derived from *template* and return a file descriptor for the file open for reading and writing. The application shall ensure that the string provided in *template* is a pathname ending with at least six trailing 'X' characters. The *mkstemp*( ) function shall modify the contents of *template* by replacing six or more 'X' characters at the end of the pathname with the same number of characters from the portable filename character set. The characters shall be chosen such that the resulting pathname does not duplicate the name of an existing file at the time of the call to *mkstemp*( ). The *mkstemp*( ) function shall use the resulting pathname to create the file, and obtain a file descriptor for it, as if by a call to:

```
open(pathname, O_RDWR|O_CREAT|O_EXCL, S_IRUSR|S_IWUSR)
```

By behaving as if the O_EXCL flag for *open*( ) is set, the function prevents any possible race condition between testing whether the file exists and opening it for use.

RETURN VALUE

Upon successful completion, the *mkdtemp*( ) function shall return the value of *template*. Otherwise, it shall return a null pointer and shall set *errno* to indicate the error.

Upon successful completion, the *mkstemp*( ) function shall return an open file descriptor. Otherwise, it shall return –1 and shall set *errno* to indicate the error.

ERRORS

The *mkdtemp*( ) function shall fail if:

[EACCES] Search permission is denied on a component of the path prefix, or write permission is denied on the parent directory of the directory to be created.

[EINVAL] The string pointed to by *template* does not end in "XXXXXX".

[ELOOP] A loop exists in symbolic links encountered during resolution of the path of the directory to be created.

[EMLINK] The link count of the parent directory would exceed {LINK_MAX}.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

43946 [ENOENT] A component of the path prefix specified by the *template* argument does not
43947 name an existing directory.

43948 [ENOSPC] The file system does not contain enough space to hold the contents of the new
43949 directory or to extend the parent directory of the new directory.

43950 [ENOTDIR] A component of the path prefix names an existing file that is neither a
43951 directory nor a symbolic link to a directory.

43952 [EROFS] The parent directory resides on a read-only file system.

43953 The *mkdtemp*( ) function may fail if:

43954 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
43955 resolution of the path of the directory to be created.

43956 [ENAMETOOLONG]
43957 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
43958 symbolic link produced an intermediate result with a length that exceeds
43959 {PATH_MAX}.

43960 The error conditions for the *mkstemp*( ) function are defined in *open*( ).

43961 **EXAMPLES**

43962 **Generating a Pathname**

43963 The following example creates a file with a 10-character name beginning with the characters
43964 `"file"` and opens the file for reading and writing. The value returned as the value of *fd* is a file
43965 descriptor that identifies the file.

```
43966 #include <stdlib.h>
43967 ...
43968 char template[] = "/tmp/fileXXXXXX";
43969 int fd;

43970 fd = mkstemp(template);
```

43971 **APPLICATION USAGE**

43972 It is possible to run out of letters.

43973 Portable applications should pass exactly six trailing `'X'`s in the template and no more;
43974 implementations may treat any additional trailing `'X'`s as either a fixed or replaceable part of
43975 the template. To be sure of only passing six, a fixed string of at least one non-`'X'` character
43976 should precede the six `'X'`s.

43977 Since `'X'` is in the portable filename character set, some of the replacement characters can be
43978 `'X'`s, leaving part (or even all) of the template effectively unchanged.

43979 **RATIONALE**

43997 and XSH/TC1-2008/0382 [291] are applied.

43998 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0215 [567,669] is applied.

43999 **NAME**

44000 mkfifo, mkfifoat ‡'make a FIFO special file

44001 **SYNOPSIS**

44002
```
#include <sys/stat.h>
```

44003
```
int mkfifo(const char *path, mode_t mode);
```

44004 OH
```
#include <fcntl.h>
```

44005
```
int mkfifoat(int fd, const char *path, mode_t mode);
```

44006 **DESCRIPTION**

44007 The *mkfifo*( ) function shall create a new FIFO special file named by the pathname pointed to by
44008 *path*. The file permission bits of the new FIFO shall be initialized from *mode*. The file permission
44009 bits of the *mode* argument shall be modified by the process' file creation mask.

44010 When bits in *mode* other than the file permission bits are set, the effect is implementation-
44011 defined.

44012 If *path* names a symbolic link, *mkfifo*( ) shall fail and set *errno* to [EEXIST].

44013 The FIFO's user ID shall be set to the process' effective user ID. The FIFO's group ID shall be set
44014 to the group ID of the parent directory or to the effective group ID of the process.
44015 Implementations shall provide a way to initialize the FIFO's group ID to the group ID of the
44016 parent directory. Implementations may, but need not, provide an implementation-defined way
44017 to initialize the FIFO's group ID to the effective group ID of the calling process.

44018 Upon successful completion, *mkfifo*( ) shall mark for update the last data access, last data
44019 modification, and last file status change timestamps of the file. Also, the last data modification
44020 and last file status change timestamps of the directory that contains the new entry shall be
44021 marked for update.

44022 The *mkfifoat*( ) function shall be equivalent to the *mkfifo*( ) function except in the case where *path*
44023 specifies a relative path. In this case the newly created FIFO is created relative to the directory
44024 associated with the file descriptor *fd* instead of the current working directory. If the access mode
44025 of the open file description associated with the file descriptor is not O_SEARCH, the function
44026 shall check whether directory searches are permitted using the current permissions of the
44027 directory underlying the file descriptor. If the access mode is O_SEARCH, the function shall not
44028 perform the check.

44029 If *mkfifoat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working
44030 directory shall be used and the behavior shall be identical to a call to *mkfifo*( ).

44031 **RETURN VALUE**

44032 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
44033 return –1 and set *errno* to indicate the error. If –1 is returned, no FIFO shall be created.

44034 **ERRORS**

44035 These functions shall fail if:

44036 [EACCES] A component of the path prefix denies search permission, or write permission
44037 is denied on the parent directory of the FIFO to be created.

44038 [EEXIST] The named file already exists.

44039 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
44040 argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of the path prefix of *path* does not name an existing file or *path* is an empty string.

[ENOENT] or [ENOTDIR]
The *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters. If *path* without the trailing <slash> characters would name an existing file, an [ENOENT] error shall not occur.

[ENOSPC] The directory that would contain the new file cannot be extended or the file system is out of file-allocation resources.

[ENOTDIR] A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory.

[EROFS] The named file resides on a read-only file system.

The *mkfifoat*( ) function shall fail if:

[EACCES] The access mode of the open file description associated with *fd* is not O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

[ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated with a non-directory file.

These functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

Creating a FIFO File

The following example shows how to create a FIFO file named **/home/cnd/mod_done**, with read/write permissions for owner, and with read permissions for group and others.

```
#include <sys/types.h>
#include <sys/stat.h>

int status;
...
status = mkfifo("/home/cnd/mod_done", S_IWUSR | S_IRUSR |
    S_IRGRP | S_IROTH);
```

APPLICATION USAGE

None.

RATIONALE

The syntax of this function is intended to maintain compatibility with historical implementations of *mknod*( ). The latter function was included in the 1984 /usr/group standard but only for use in creating FIFO special files. The *mknod*( ) function was originally excluded from the POSIX.1-1988 standard as implementation-defined and replaced by *mkdir*( ) and *mkfifo*( ). The *mknod*( ) function is now included for alignment with the Single UNIX Specification.

The POSIX.1-1990 standard required that the group ID of a newly created FIFO be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown*( ) to set the group ID after the FIFO is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *mkfifoat*( ) function is to create a FIFO special file in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *mkfifo*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *mkfifoat*( ) function it can be guaranteed that the newly created FIFO is located relative to the desired directory.

FUTURE DIRECTIONS

None.

SEE ALSO

chmod( ), *mknod*( ), *umask*( )

XBD **<fcntl.h>**, **<sys/stat.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *mkfifoat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0383 [461], XSH/TC1-2008/0384 [146,435], XSH/TC1-2008/0385 [324], XSH/TC1-2008/0386 [278], and XSH/TC1-2008/0387 [278] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0216 [873], XSH/TC2-2008/0217 [591], XSH/TC2-2008/0218 [817], XSH/TC2-2008/0219 [822], XSH/TC2-2008/0220 [817], and XSH/TC2-2008/0221 [591] are applied.

NAME

mknod, mknodat — make directory, special file, or regular file

SYNOPSIS

XSI
```
#include <sys/stat.h>

int mknod(const char *path, mode_t mode, dev_t dev);
```

OH XSI
```
#include <fcntl.h>
```

XSI
```
int mknodat(int fd, const char *path, mode_t mode, dev_t dev);
```

DESCRIPTION

The *mknod*( ) function shall create a new file named by the pathname to which the argument *path* points.

The file type for *path* is OR'ed into the *mode* argument, and the application shall select one of the following symbolic constants:

Name	Description
S_IFIFO	FIFO-special
S_IFCHR	Character-special (non-portable)
S_IFDIR	Directory (non-portable)
S_IFBLK	Block-special (non-portable)
S_IFREG	Regular (non-portable)

The only portable use of *mknod*( ) is to create a FIFO-special file. If *mode* is not S_IFIFO or *dev* is not 0, the behavior of *mknod*( ) is unspecified.

The permissions for the new file are OR'ed into the *mode* argument, and may be selected from any combination of the following symbolic constants:

Name	Description
S_ISUID	Set user ID on execution.
S_ISGID	Set group ID on execution.
S_IRWXU	Read, write, or execute (search) by owner.
S_IRUSR	Read by owner.
S_IWUSR	Write by owner.
S_IXUSR	Execute (search) by owner.
S_IRWXG	Read, write, or execute (search) by group.
S_IRGRP	Read by group.
S_IWGRP	Write by group.
S_IXGRP	Execute (search) by group.
S_IRWXO	Read, write, or execute (search) by others.
S_IROTH	Read by others.
S_IWOTH	Write by others.
S_IXOTH	Execute (search) by others.
S_ISVTX	On directories, restricted deletion flag.

The user ID of the file shall be initialized to the effective user ID of the process. The group ID of the file shall be initialized to either the effective group ID of the process or the group ID of the parent directory. Implementations shall provide a way to initialize the file's group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the file's group ID to the effective group ID of the

calling process. The owner, group, and other permission bits of *mode* shall be modified by the file mode creation mask of the process. The *mknod*( ) function shall clear each bit whose corresponding bit in the file mode creation mask of the process is set.

If *path* names a symbolic link, *mknod*( ) shall fail and set *errno* to [EEXIST].

Upon successful completion, *mknod*( ) shall mark for update the last data access, last data modification, and last file status change timestamps of the file. Also, the last data modification and last file status change timestamps of the directory that contains the new entry shall be marked for update.

Only a process with appropriate privileges may invoke *mknod*( ) for file types other than FIFO-special.

The *mknodat*( ) function shall be equivalent to the *mknod*( ) function except in the case where *path* specifies a relative path. In this case the newly created directory, special file, or regular file is located relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the access mode of the open file description associated with the file descriptor is not O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the access mode is O_SEARCH, the function shall not perform the check.

If *mknodat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working directory shall be used and the behavior shall be identical to a call to *mknod*( ).

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return −1 and set *errno* to indicate the error. If −1 is returned, the new file shall not be created.

ERRORS

These functions shall fail if:

[EACCES] A component of the path prefix denies search permission, or write permission is denied on the parent directory.

[EEXIST] The named file exists.

[EINVAL] An invalid argument exists.

[EIO] An I/O error occurred while accessing the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of the path prefix of *path* does not name an existing file or *path* is an empty string.

[ENOENT] or [ENOTDIR]
The *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters. If *path* without the trailing <slash> characters would name an existing file, an [ENOENT] error shall not occur.

[ENOSPC] The directory that would contain the new file cannot be extended or the file system is out of file allocation resources.

[ENOTDIR] A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory.

[EPERM] The invoking process does not have appropriate privileges and the file type is not FIFO-special.

[EROFS] The directory in which the file is to be created is located on a read-only file system.

The *mknodat*( ) function shall fail if:

[EACCES] The access mode of the open file description associated with *fd* is not O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

[ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated with a non-directory file.

These functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

Creating a FIFO Special File

The following example shows how to create a FIFO special file named **/home/cnd/mod_done**, with read/write permissions for owner, and with read permissions for group and others.

```
#include <sys/types.h>
#include <sys/stat.h>

dev_t dev;
int   status;
...
status  = mknod("/home/cnd/mod_done", S_IFIFO | S_IWUSR |
    S_IRUSR | S_IRGRP | S_IROTH, dev);
```

APPLICATION USAGE

The *mkfifo*( ) function is preferred over this function for making FIFO special files.

RATIONALE

The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown*( ) to set the group ID after the file is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *mknodat*( ) function is to create directories, special files, or regular files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *mknod*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *mknodat*( ) function it can be guaranteed that the newly created directory, special file, or regular file is located relative to the desired directory.

FUTURE DIRECTIONS

None.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0222 [591], XSH/TC2-2008/0223 [817], XSH/TC2-2008/0224 [822], XSH/TC2-2008/0225 [817], and XSH/TC2-2008/0226 [591] are applied.

NAME

mkstemp — create a unique file

SYNOPSIS

CX

```
#include <stdlib.h>

int mkstemp(char *template);
```

DESCRIPTION

Refer to *mkdtemp( )*.

NAME

mktime — convert broken-down time into time since the Epoch

SYNOPSIS

```
#include <time.h>

time_t mktime(struct tm *timeptr);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *mktime*( ) function shall convert the broken-down time, expressed as local time, in the structure pointed to by *timeptr*, into a time since the Epoch value with the same encoding as that of the values returned by *time*( ). The original values of the *tm_wday* and *tm_yday* components of the structure shall be ignored, and the original values of the other components shall not be restricted to the ranges described in **<time.h>**.

CX A positive or 0 value for *tm_isdst* shall cause *mktime*( ) to presume initially that Daylight Savings Time, respectively, is or is not in effect for the specified time. A negative value for *tm_isdst* shall cause *mktime*( ) to attempt to determine whether Daylight Savings Time is in effect for the specified time.

Local timezone information shall be set as though *mktime*( ) called *tzset*( ).

The relationship between the **tm** structure (defined in the **<time.h>** header) and the time in seconds since the Epoch is that the result shall be as specified in the expression given in the definition of seconds since the Epoch (see XBD Section 4.16, on page 113) corrected for timezone and any seasonal time adjustments, where the names other than *tm_yday* in the structure and in the expression correspond, and the *tm_yday* value used in the expression is the day of the year from 0 to 365 inclusive, calculated from the other **tm** structure members specified in **<time.h>** (excluding *tm_wday*).

Upon successful completion, the values of the *tm_wday* and *tm_yday* components of the structure shall be set appropriately, and the other components shall be set to represent the specified time since the Epoch, but with their values forced to the ranges indicated in the **<time.h>** entry; the final value of *tm_mday* shall not be set until *tm_mon* and *tm_year* are determined.

RETURN VALUE

The *mktime*( ) function shall return the specified time since the Epoch encoded as a value of type **time_t**. If the time since the Epoch cannot be represented, the function shall return the value (**time_t**)–1 CX and set *errno* to indicate the error.

ERRORS

The *mktime*( ) function shall fail if:

CX [EOVERFLOW] The result cannot be represented.

EXAMPLES

What day of the week is July 4, 2001?

```
#include <stdio.h>
#include <time.h>

struct tm time_str;

char daybuf[20];

int main(void)
{
    time_str.tm_year = 2001 -1900;
    time_str.tm_mon = 7 - 1;
    time_str.tm_mday = 4;
    time_str.tm_hour = 0;
    time_str.tm_min = 0;
    time_str.tm_sec = 1;
    time_str.tm_isdst = -1;
    if (mktime(&time_str) == -1)
        (void)puts("-unknown-");
    else {
        (void)strftime(daybuf, sizeof(daybuf), "%A", &time_str);
        (void)puts(daybuf);
    }
    return 0;
}
```

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ANSI C standard.

Issue 6

Extensions beyond the ISO C standard are marked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/58 is applied, updating the RETURN VALUE and ERRORS sections to add the optional [EOVERFLOW] error as a CX extension.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/59 is applied, adding the *tzset*( ) function to the SEE ALSO section.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0393 [104] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0228 [724] is applied.

NAME

mlock, munlock — lock or unlock a range of process address space (**REALTIME**)

SYNOPSIS

MLR

```
#include <sys/mman.h>

int mlock(const void *addr, size_t len);
int munlock(const void *addr, size_t len);
```

DESCRIPTION

The *mlock*( ) function shall cause those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes to be memory-resident until unlocked or until the process exits or *exec*s another process image. The implementation may require that *addr* be a multiple of {PAGESIZE}.

The *munlock*( ) function shall unlock those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes, regardless of how many times *mlock*( ) has been called by the process for any of the pages in the specified range. The implementation may require that *addr* be a multiple of {PAGESIZE}.

If any of the pages in the range specified to a call to *munlock*( ) are also mapped into the address spaces of other processes, any locks established on those pages by another process are unaffected by the call of this process to *munlock*( ). If any of the pages in the range specified by a call to *munlock*( ) are also mapped into other portions of the address space of the calling process outside the range specified, any locks established on those pages via the other mappings are also unaffected by this call.

Upon successful return from *mlock*( ), pages in the specified range shall be locked and memory-resident. Upon successful return from *munlock*( ), pages in the specified range shall be unlocked with respect to the address space of the process. Memory residency of unlocked pages is unspecified.

Appropriate privileges are required to lock process memory with *mlock*( ).

RETURN VALUE

Upon successful completion, the *mlock*( ) and *munlock*( ) functions shall return a value of zero. Otherwise, no change is made to any locks in the address space of the process, and the function shall return a value of –1 and set *errno* to indicate the error.

ERRORS

The *mlock*( ) and *munlock*( ) functions shall fail if:

[ENOMEM] Some or all of the address range specified by the *addr* and *len* arguments does not correspond to valid mapped pages in the address space of the process.

The *mlock*( ) function shall fail if:

[EAGAIN] Some or all of the memory identified by the operation could not be locked when the call was made.

The *mlock*( ) and *munlock*( ) functions may fail if:

[EINVAL] The *addr* argument is not a multiple of {PAGESIZE}.

The *mlock*( ) function may fail if:

[ENOMEM] Locking the pages mapped by the specified range would exceed an implementation-defined limit on the amount of memory that the process may lock.

[EPERM] The calling process does not have appropriate privileges to perform the requested operation.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mlock*( ) and *munlock*( ) functions are marked as part of the Range Memory Locking option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Range Memory Locking option.

NAME

mlockall, munlockall — lock/unlock the address space of a process (**REALTIME**)

SYNOPSIS

ML
```
#include <sys/mman.h>

int mlockall(int flags);
int munlockall(void);
```

DESCRIPTION

The *mlockall*( ) function shall cause all of the pages mapped by the address space of a process to be memory-resident until unlocked or until the process exits or *exec*s another process image. The *flags* argument determines whether the pages to be locked are those currently mapped by the address space of the process, those that are mapped in the future, or both. The *flags* argument is constructed from the bitwise-inclusive OR of one or more of the following symbolic constants, defined in **<sys/mman.h>**:

MCL_CURRENT Lock all of the pages currently mapped into the address space of the process.

MCL_FUTURE Lock all of the pages that become mapped into the address space of the process in the future, when those mappings are established.

If MCL_FUTURE is specified, and the automatic locking of future mappings eventually causes the amount of locked memory to exceed the amount of available physical memory or any other implementation-defined limit, the behavior is implementation-defined. The manner in which the implementation informs the application of these situations is also implementation-defined.

The *munlockall*( ) function shall unlock all currently mapped pages of the address space of the process. Any pages that become mapped into the address space of the process after a call to *munlockall*( ) shall not be locked, unless there is an intervening call to *mlockall*( ) specifying MCL_FUTURE or a subsequent call to *mlockall*( ) specifying MCL_CURRENT. If pages mapped into the address space of the process are also mapped into the address spaces of other processes and are locked by those processes, the locks established by the other processes shall be unaffected by a call by this process to *munlockall*( ).

Upon successful return from the *mlockall*( ) function that specifies MCL_CURRENT, all currently mapped pages of the address space of the process shall be memory-resident and locked. Upon return from the *munlockall*( ) function, all currently mapped pages of the address space of the process shall be unlocked with respect to the address space of the process. The memory residency of unlocked pages is unspecified.

Appropriate privileges are required to lock process memory with *mlockall*( ).

RETURN VALUE

Upon successful completion, the *mlockall*( ) function shall return a value of zero. Otherwise, no additional memory shall be locked, and the function shall return a value of −1 and set *errno* to indicate the error. The effect of failure of *mlockall*( ) on previously existing locks in the address space is unspecified.

If it is supported by the implementation, the *munlockall*( ) function shall always return a value of zero. Otherwise, the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *mlockall*( ) function shall fail if:

[EAGAIN] Some or all of the memory identified by the operation could not be locked when the call was made.

[EINVAL] The *flags* argument is zero, or includes unimplemented flags.

The *mlockall*( ) function may fail if:

[ENOMEM] Locking all of the pages currently mapped into the address space of the process would exceed an implementation-defined limit on the amount of memory that the process may lock.

[EPERM] The calling process does not have appropriate privileges to perform the requested operation.

EXAMPLES

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mlockall*( ) and *munlockall*( ) functions are marked as part of the Process Memory Locking option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Process Memory Locking option.

NAME

mmap ‡'map pages of memory

SYNOPSIS

```
#include <sys/mman.h>

void *mmap(void *addr, size_t len, int prot, int flags,
    int fildes, off_t off);
```

DESCRIPTION

The *mmap*( ) function shall establish a mapping between an address space of a process and a memory object.

The *mmap*( ) function shall be supported for the following memory objects:

- Regular files
- SHM Shared memory objects
- TYM Typed memory objects

Support for any other type of file is unspecified.

The format of the call is as follows:

```
pa=mmap(addr, len, prot, flags, fildes, off);
```

The *mmap*( ) function shall establish a mapping between the address space of the process at an address *pa* for *len* bytes to the memory object represented by the file descriptor *fildes* at offset *off* for *len* bytes. The value of *pa* is an implementation-defined function of the parameter *addr* and the values of *flags*, further described below. A successful *mmap*( ) call shall return *pa* as its result. The address range starting at *pa* and continuing for *len* bytes shall be legitimate for the possible (not necessarily current) address space of the process. The range of bytes starting at *off* and continuing for *len* bytes shall be legitimate for the possible (not necessarily current) offsets in the memory object represented by *fildes*.

TYM If *fildes* represents a typed memory object opened with either the POSIX_TYPED_MEM_ALLOCATE flag or the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, the memory object to be mapped shall be that portion of the typed memory object allocated by the implementation as specified below. In this case, if *off* is non-zero, the behavior of *mmap*( ) is undefined. If *fildes* refers to a valid typed memory object that is not accessible from the calling process, *mmap*( ) shall fail.

The mapping established by *mmap*( ) shall replace any previous mappings for those whole pages containing any part of the address space of the process starting at *pa* and continuing for *len* bytes.

If the size of the mapped file changes after the call to *mmap*( ) as a result of some other operation on the mapped file, the effect of references to portions of the mapped region that correspond to added or removed portions of the file is unspecified.

If *len* is zero, *mmap*( ) shall fail and no mapping shall be established.

The parameter *prot* determines whether read, write, execute, or some combination of accesses are permitted to the data being mapped. The *prot* shall be either PROT_NONE or the bitwise-inclusive OR of one or more of the other flags in the following table, defined in the **<sys/mman.h>** header.

Symbolic Constant	Description
PROT_READ	Data can be read.
PROT_WRITE	Data can be written.
PROT_EXEC	Data can be executed.
PROT_NONE	Data cannot be accessed.

If an implementation cannot support the combination of access types specified by *prot*, the call to *mmap*( ) shall fail.

An implementation may permit accesses other than those specified by *prot*; however, the implementation shall not permit a write to succeed where PROT_WRITE has not been set and shall not permit any access where PROT_NONE alone has been set. The implementation shall support at least the following values of *prot*: PROT_NONE, PROT_READ, PROT_WRITE, and the bitwise-inclusive OR of PROT_READ and PROT_WRITE. The file descriptor *fildes* shall have been opened with read permission, regardless of the protection options specified. If PROT_WRITE is specified, the application shall ensure that it has opened the file descriptor *fildes* with write permission unless MAP_PRIVATE is specified in the *flags* parameter as described below.

The parameter *flags* provides other information about the handling of the mapped data. The value of *flags* is the bitwise-inclusive OR of these options, defined in **<sys/mman.h>**:

Symbolic Constant	Description
MAP_SHARED	Changes are shared.
MAP_PRIVATE	Changes are private.
MAP_FIXED	Interpret *addr* exactly.

XSI It is implementation-defined whether MAP_FIXED shall be supported. MAP_FIXED shall be supported on XSI-conformant systems.

MAP_SHARED and MAP_PRIVATE describe the disposition of write references to the memory object. If MAP_SHARED is specified, write references shall change the underlying object. If MAP_PRIVATE is specified, modifications to the mapped data by the calling process shall be visible only to the calling process and shall not change the underlying object. It is unspecified whether modifications to the underlying object done after the MAP_PRIVATE mapping is established are visible through the MAP_PRIVATE mapping. Either MAP_SHARED or MAP_PRIVATE can be specified, but not both. The mapping type is retained across *fork*( ).

The state of synchronization objects such as mutexes, semaphores, barriers, and conditional variables placed in shared memory mapped with MAP_SHARED becomes undefined when the last region in any process containing the synchronization object is unmapped.

TYM When *fildes* represents a typed memory object opened with either the POSIX_TYPED_MEM_ALLOCATE flag or the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, *mmap*( ) shall, if there are enough resources available, map *len* bytes allocated from the corresponding typed memory object which were not previously allocated to any process in any processor that may access that typed memory object. If there are not enough resources available, the function shall fail. If *fildes* represents a typed memory object opened with the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, these allocated bytes shall be contiguous within the typed memory object. If *fildes* represents a typed memory object opened with the POSIX_TYPED_MEM_ALLOCATE flag, these allocated bytes may be composed of non-contiguous fragments within the typed memory object. If *fildes* represents a typed memory object opened with neither the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag nor the POSIX_TYPED_MEM_ALLOCATE flag, *len* bytes starting at offset *off* within the typed memory object are mapped, exactly as when mapping a file or shared memory object. In this case, if two

processes map an area of typed memory using the same *off* and *len* values and using file descriptors that refer to the same memory pool (either from the same port or from a different port), both processes shall map the same region of storage.

When MAP_FIXED is set in the *flags* argument, the implementation is informed that the value of *pa* shall be *addr*, exactly. If MAP_FIXED is set, *mmap*( ) may return MAP_FAILED and set *errno* to
ML | MLR [EINVAL]. If a MAP_FIXED request is successful, then any previous mappings or memory locks for those whole pages containing any part of the address range [*pa*,*pa*+*len*) shall be removed, as if by an appropriate call to *munmap*( ), before the new mapping is established.

When MAP_FIXED is not set, the implementation uses *addr* in an implementation-defined manner to arrive at *pa*. The *pa* so chosen shall be an area of the address space that the implementation deems suitable for a mapping of *len* bytes to the file. All implementations interpret an *addr* value of 0 as granting the implementation complete freedom in selecting *pa*, subject to constraints described below. A non-zero value of *addr* is taken to be a suggestion of a process address near which the mapping should be placed. When the implementation selects a value for *pa*, it never places a mapping at address 0, nor does it replace any extant mapping.

If MAP_FIXED is specified and *addr* is non-zero, it shall have the same remainder as the *off* parameter, modulo the page size as returned by *sysconf*( ) when passed _SC_PAGESIZE or _SC_PAGE_SIZE. The implementation may require that off is a multiple of the page size. If MAP_FIXED is specified, the implementation may require that *addr* is a multiple of the page size. The system performs mapping operations over whole pages. Thus, while the parameter *len* need not meet a size or alignment constraint, the system shall include, in any mapping operation, any partial page specified by the address range starting at *pa* and continuing for *len* bytes.

The system shall always zero-fill any partial page at the end of an object. Further, the system shall never write out any modified portions of the last page of an object which are beyond its end. References within the address range starting at *pa* and continuing for *len* bytes to whole pages following the end of an object shall result in delivery of a SIGBUS signal.

An implementation may generate SIGBUS signals when a reference would cause an error in the mapped object, such as out-of-space condition.

The *mmap*( ) function shall add an extra reference to the file associated with the file descriptor *fildes* which is not removed by a subsequent *close*( ) on that file descriptor. This reference shall be removed when there are no more mappings to the file.

The last data access timestamp of the mapped file may be marked for update at any time between the *mmap*( ) call and the corresponding *munmap*( ) call. The initial read or write reference to a mapped region shall cause the file's last data access timestamp to be marked for update if it has not already been marked for update.

The last data modification and last file status change timestamps of a file that is mapped with MAP_SHARED and PROT_WRITE shall be marked for update at some point in the interval between a write reference to the mapped region and the next call to *msync*( ) with MS_ASYNC or MS_SYNC for that portion of the file by any process. If there is no such call and if the underlying file is modified as a result of a write reference, then these timestamps shall be marked for update at some time after the write reference.

There may be implementation-defined limits on the number of memory regions that can be mapped (per process or per system).

XSI If such a limit is imposed, whether the number of memory regions that can be mapped by a process is decreased by the use of *shmat*( ) is implementation-defined.

If *mmap*( ) fails for reasons other than [EBADF], [EINVAL], or [ENOTSUP], some of the mappings in the address range starting at *addr* and continuing for *len* bytes may have been unmapped.

RETURN VALUE

Upon successful completion, the *mmap*( ) function shall return the address at which the mapping was placed (*pa*); otherwise, it shall return a value of MAP_FAILED and set *errno* to indicate the error. The symbol MAP_FAILED is defined in the **<sys/mman.h>** header. No successful return from *mmap*( ) shall return the value MAP_FAILED.

ERRORS

The *mmap*( ) function shall fail if:

[EACCES] The *fildes* argument is not open for read, regardless of the protection specified, or *fildes* is not open for write and PROT_WRITE was specified for a MAP_SHARED type mapping.

ML [EAGAIN] The mapping could not be locked in memory, if required by *mlockall*( ), due to a lack of resources.

[EBADF] The *fildes* argument is not a valid open file descriptor.

[EINVAL] The value of *len* is zero.

[EINVAL] The value of *flags* is invalid (neither MAP_PRIVATE nor MAP_SHARED is set).

[EMFILE] The number of mapped regions would exceed an implementation-defined limit (per process or per system).

[ENODEV] The *fildes* argument refers to a file whose type is not supported by *mmap*( ).

[ENOMEM] MAP_FIXED was specified, and the range [*addr*,*addr*+*len*) exceeds that allowed for the address space of a process; or, if MAP_FIXED was not specified and there is insufficient room in the address space to effect the mapping.

ML [ENOMEM] The mapping could not be locked in memory, if required by *mlockall*( ), because it would require more space than the system is able to supply.

TYM [ENOMEM] Not enough unallocated memory resources remain in the typed memory object designated by *fildes* to allocate *len* bytes.

[ENOTSUP] MAP_FIXED or MAP_PRIVATE was specified in the *flags* argument and the implementation does not support this functionality.

The implementation does not support the combination of accesses requested in the *prot* argument.

[ENXIO] Addresses in the range [*off*,*off*+*len*) are invalid for the object specified by *fildes*.

[ENXIO] MAP_FIXED was specified in *flags* and the combination of *addr*, *len*, and *off* is invalid for the object specified by *fildes*.

TYM [ENXIO] The *fildes* argument refers to a typed memory object that is not accessible from the calling process.

[EOVERFLOW] The file is a regular file and the value of *off* plus *len* exceeds the offset maximum established in the open file description associated with *fildes*.

The *mmap*( ) function may fail if:

[EINVAL] The *addr* argument (if MAP_FIXED was specified) or *off* is not a multiple of the page size as returned by *sysconf*( ), or is considered invalid by the implementation.

EXAMPLES

None.

APPLICATION USAGE

Use of *mmap*( ) may reduce the amount of memory available to other memory allocation functions.

Use of MAP_FIXED may result in unspecified behavior in further use of *malloc*( ) and *shmat*( ). The use of MAP_FIXED is discouraged, as it may prevent an implementation from making the most effective use of resources. Most implementations require that *off* and *addr* are multiples of the page size as returned by *sysconf*( ).

The application must ensure correct synchronization when using *mmap*( ) in conjunction with any other file access method, such as *read*( ) and *write*( ), standard input/output, and *shmat*( ).

The *mmap*( ) function allows access to resources via address space manipulations, instead of *read*( )/*write*( ). Once a file is mapped, all a process has to do to access it is use the data at the address to which the file was mapped. So, using pseudo-code to illustrate the way in which an existing program might be changed to use *mmap*( ), the following:

```
fildes = open(...)
lseek(fildes, some_offset)
read(fildes, buf, len)
/* Use data in buf. */
```

becomes:

```
fildes = open(...)
address = mmap(0, len, PROT_READ, MAP_PRIVATE, fildes, some_offset)
/* Use data at address. */
```

RATIONALE

After considering several other alternatives, it was decided to adopt the *mmap*( ) definition found in SVR4 for mapping memory objects into process address spaces. The SVR4 definition is minimal, in that it describes only what has been built, and what appears to be necessary for a general and portable mapping facility.

Note that while *mmap*( ) was first designed for mapping files, it is actually a general-purpose mapping facility. It can be used to map any appropriate object, such as memory, files, devices, and so on, into the address space of a process.

When a mapping is established, it is possible that the implementation may need to map more than is requested into the address space of the process because of hardware requirements. An application, however, cannot count on this behavior. Implementations that do not use a paged architecture may simply allocate a common memory region and return the address of it; such implementations probably do not allocate any more than is necessary. References past the end of the requested area are unspecified.

If an application requests a mapping that overlaps existing mappings in the process, it might be desirable that an implementation detect this and inform the application. However, if the program specifies a fixed address mapping (which requires some implementation knowledge to determine a suitable address, if the function is supported at all), then the program is presumed

to be successfully managing its own address space and should be trusted when it asks to map over existing data structures. Furthermore, it is also desirable to make as few system calls as possible, and it might be considered onerous to require an *munmap*( ) before an *mmap*( ) to the same address range. This volume of POSIX.1-2017 specifies that the new mapping replaces any existing mappings (implying an automatic *munmap*( ) on the address range), following existing practice in this regard. The standard developers also considered whether there should be a way for new mappings to overlay existing mappings, but found no existing practice for this.

It is not expected that all hardware implementations are able to support all combinations of permissions at all addresses. Implementations are required to disallow write access to mappings without write permission and to disallow access to mappings without any access permission. Other than these restrictions, implementations may allow access types other than those requested by the application. For example, if the application requests only PROT_WRITE, the implementation may also allow read access. A call to *mmap*( ) fails if the implementation cannot support allowing all the access requested by the application. For example, some implementations cannot support a request for both write access and execute access simultaneously. All implementations must support requests for no access, read access, write access, and both read and write access. Strictly conforming code must only rely on the required checks. These restrictions allow for portability across a wide range of hardware.

The MAP_FIXED address treatment is likely to fail for non-page-aligned values and for certain architecture-dependent address ranges. Conforming implementations cannot count on being able to choose address values for MAP_FIXED without utilizing non-portable, implementation-defined knowledge. Nonetheless, MAP_FIXED is provided as a standard interface conforming to existing practice for utilizing such knowledge when it is available.

Similarly, in order to allow implementations that do not support virtual addresses, support for directly specifying any mapping addresses via MAP_FIXED is not required and thus a conforming application may not count on it.

The MAP_PRIVATE function can be implemented efficiently when memory protection hardware is available. When such hardware is not available, implementations can implement such ``mappings'' by simply making a real copy of the relevant data into process private memory, though this tends to behave similarly to *read*( ).

The function has been defined to allow for many different models of using shared memory. However, all uses are not equally portable across all machine architectures. In particular, the *mmap*( ) function allows the system as well as the application to specify the address at which to map a specific region of a memory object. The most portable way to use the function is always to let the system choose the address, specifying NULL as the value for the argument *addr* and not to specify MAP_FIXED.

If it is intended that a particular region of a memory object be mapped at the same address in a group of processes (on machines where this is even possible), then MAP_FIXED can be used to pass in the desired mapping address. The system can still be used to choose the desired address if the first such mapping is made without specifying MAP_FIXED, and then the resulting mapping address can be passed to subsequent processes for them to pass in via MAP_FIXED. The availability of a specific address range cannot be guaranteed, in general.

The *mmap*( ) function can be used to map a region of memory that is larger than the current size of the object. Memory access within the mapping but beyond the current end of the underlying objects may result in SIGBUS signals being sent to the process. The reason for this is that the size of the object can be manipulated by other processes and can change at any moment. The implementation should tell the application that a memory reference is outside the object where this can be detected; otherwise, written data may be lost and read data may not reflect actual

data in the object.

Note that references beyond the end of the object do not extend the object as the new end cannot be determined precisely by most virtual memory hardware. Instead, the size can be directly manipulated by *ftruncate*( ).

Process memory locking does apply to shared memory regions, and the MCL_FUTURE argument to *mlockall*( ) can be relied upon to cause new shared memory regions to be automatically locked.

Existing implementations of *mmap*( ) return the value –1 when unsuccessful. Since the casting of this value to type **void** * cannot be guaranteed by the ISO C standard to be distinct from a successful value, this volume of POSIX.1-2017 defines the symbol MAP_FAILED, which a conforming implementation does not return as the result of a successful call.

FUTURE DIRECTIONS

None.

XBD **<sys/mman.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Aligned with *mmap*( ) in the POSIX Realtime Extension as follows:

- The DESCRIPTION is extensively reworded.
- The [EAGAIN] and [ENOTSUP] mandatory error conditions are added.
- New cases of [ENOMEM] and [ENXIO] are added as mandatory error conditions.
- The value returned on failure is the value of the constant MAP_FAILED; this was previously defined as –1.

Large File Summit extensions are added.

Issue 6

The *mmap*( ) function is marked as part of the Memory Mapped Files option.

The Open Group Corrigendum U028/6 is applied, changing (**void** *)–1 to MAP_FAILED.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to describe the use of MAP_FIXED.
- The DESCRIPTION is updated to describe the addition of an extra reference to the file associated with the file descriptor passed to *mmap*( ).
- The DESCRIPTION is updated to state that there may be implementation-defined limits on the number of memory regions that can be mapped.
- The DESCRIPTION is updated to describe constraints on the alignment and size of the *off* argument.

The [EINVAL] and [EMFILE] error conditions are added.

The [EOVERFLOW] error condition is added. This change is to support large files.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

The DESCRIPTION is updated to describe the cases when MAP_PRIVATE and MAP_FIXED need not be supported.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

Semantics for typed memory objects are added to the DESCRIPTION.

New [ENOMEM] and [ENXIO] errors are added to the ERRORS section.

The *posix_typed_mem_open*( ) function is added to the SEE ALSO section.

The normative text is updated to avoid use of the term ``must'' for application requirements.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/60 is applied, updating the DESCRIPTION and ERRORS sections to add the [EINVAL] error when *len* is zero.

Issue 7

Austin Group Interpretations 1003.1-2001 #078 and #079 are applied, clarifying page alignment requirements and adding a note about the state of synchronization objects becoming undefined when a shared region is unmapped.

Functionality relating to the Memory Protection and Memory Mapped Files options is moved to the Base.

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0229 [852] is applied.

NAME

modf, modff, modfl — decompose a floating-point number

SYNOPSIS

```
#include <math.h>

double modf(double x, double *iptr);
float modff(float value, float *iptr);
long double modfl(long double value, long double *iptr);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall break the argument *x* into integral and fractional parts, each of which has the same sign as the argument. It stores the integral part as a **double** (for the *modf*( ) function), a **float** (for the *modff*( ) function), or a **long double** (for the *modfl*( ) function), in the object pointed to by *iptr*.

RETURN VALUE

Upon successful completion, these functions shall return the signed fractional part of *x*.

MX If *x* is NaN, a NaN shall be returned, and **iptr* shall be set to a NaN.

If *x* is ±Inf, ±0 shall be returned, and **iptr* shall be set to ±Inf.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *modf*( ) function computes the function result and **iptr* such that:

```
a = modf(x, iptr) ;
x == a+*iptr ;
```

allowing for the usual floating-point inaccuracies.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *modff*( ) and *modfl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/35 is applied, correcting the code example in the APPLICATION USAGE section.

NAME

mprotect — set protection of memory mapping

SYNOPSIS

```
#include <sys/mman.h>

int mprotect(void *addr, size_t len, int prot);
```

DESCRIPTION

The *mprotect*( ) function shall change the access protections to be that specified by *prot* for those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes. The parameter *prot* determines whether read, write, execute, or some combination of accesses are permitted to the data being mapped. The *prot* argument should be either PROT_NONE or the bitwise-inclusive OR of one or more of PROT_READ, PROT_WRITE, and PROT_EXEC.

If an implementation cannot support the combination of access types specified by *prot*, the call to *mprotect*( ) shall fail.

An implementation may permit accesses other than those specified by *prot*; however, no implementation shall permit a write to succeed where PROT_WRITE has not been set or shall permit any access where PROT_NONE alone has been set. Implementations shall support at least the following values of *prot*: PROT_NONE, PROT_READ, PROT_WRITE, and the bitwise-inclusive OR of PROT_READ and PROT_WRITE. If PROT_WRITE is specified, the application shall ensure that it has opened the mapped objects in the specified address range with write permission, unless MAP_PRIVATE was specified in the original mapping, regardless of whether the file descriptors used to map the objects have since been closed.

The implementation may require that *addr* be a multiple of the page size as returned by *sysconf*( ).

The behavior of this function is unspecified if the mapping was not established by a call to *mmap*( ).

When *mprotect*( ) fails for reasons other than [EINVAL], the protections on some of the pages in the range [*addr*,*addr*+*len*) may have been changed.

RETURN VALUE

Upon successful completion, *mprotect*( ) shall return 0; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *mprotect*( ) function shall fail if:

[EACCES] The *prot* argument specifies a protection that violates the access permission the process has to the underlying memory object.

[EAGAIN] The *prot* argument specifies PROT_WRITE over a MAP_PRIVATE mapping and there are insufficient memory resources to reserve for locking the private page.

[ENOMEM] Addresses in the range [*addr*,*addr*+*len*) are invalid for the address space of a process, or specify one or more pages which are not mapped.

[ENOMEM] The *prot* argument specifies PROT_WRITE on a MAP_PRIVATE mapping, and it would require more space than the system is able to supply for locking the private pages, if required.

[ENOTSUP] The implementation does not support the combination of accesses requested in the *prot* argument.

The *mprotect*( ) function may fail if:

[EINVAL] The *addr* argument is not a multiple of the page size as returned by *sysconf*( ).

EXAMPLES

None.

APPLICATION USAGE

Most implementations require that *addr* is a multiple of the page size as returned by *sysconf*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Aligned with *mprotect*( ) in the POSIX Realtime Extension as follows:

The DESCRIPTION is largely reworded.

[ENOTSUP] and a second form of [ENOMEM] are added as mandatory error conditions.

[EAGAIN] is moved from the optional to the mandatory error conditions.

Issue 6

The *mprotect*( ) function is marked as part of the Memory Protection option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of the page size as returned by *sysconf*( ).

The [EINVAL] error condition is added.

The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

SD5-XSH-ERN-22 is applied, deleting erroneous APPLICATION USAGE.

Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment requirements.

The *mprotect*( ) function is moved from the Memory Protection option to the Base.

NAME

mq_close ‡'close a message queue (**REALTIME**)

SYNOPSIS

MSG

```
#include <mqueue.h>

int mq_close(mqd_t mqdes);
```

DESCRIPTION

The *mq_close*( ) function shall remove the association between the message queue descriptor, *mqdes*, and its message queue. The results of using this message queue descriptor after successful return from this *mq_close*( ), and until the return of this message queue descriptor from a subsequent *mq_open*( ), are undefined.

If the process has successfully attached a notification request to the message queue via this *mqdes*, this attachment shall be removed, and the message queue is available for another process to attach for notification.

RETURN VALUE

Upon successful completion, the *mq_close*( ) function shall return a value of zero; otherwise, the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *mq_close*( ) function shall fail if:

[EBADF] The *mqdes* argument is not a valid message queue descriptor.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_close*( ) function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

45002 **NAME**

45003 mq_getattr ‡’get message queue attributes(**REALTIME**)

45004 **SYNOPSIS**

45005 MSG
```
#include <mqueue.h>

int mq_getattr(mqd_t mqdes, struct mq_attr *mqstat);
```
45006

45007 **DESCRIPTION**

45008 The *mq_getattr*( ) function shall obtain status information and attributes of the message queue
45009 and the open message queue description associated with the message queue descriptor.

45010 The *mqdes* argument specifies a message queue descriptor.

45011 The results shall be returned in the **mq_attr** structure referenced by the *mqstat* argument.

45012 Upon return, the following members shall have the values associated with the open message
45013 queue description as set when the message queue was opened and as modified by subsequent
45014 *mq_setattr*( ) calls: *mq_flags*.

45015 The following attributes of the message queue shall be returned as set at message queue
45016 creation: *mq_maxmsg*, *mq_msgsize*.

45017 Upon return, the following members within the **mq_attr** structure referenced by the *mqstat*
45018 argument shall be set to the current state of the message queue:

45019 *mq_curmsgs* The number of messages currently on the queue.

45020 **RETURN VALUE**

45021 Upon successful completion, the *mq_getattr*( ) function shall return zero. Otherwise, the function
45022 shall return –1 and set *errno* to indicate the error.

45023 **ERRORS**

45024 The *mq_getattr*( ) function may fail if:

45025 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

45026 **EXAMPLES**

45027 See *mq_notify*( ).

45036 XBD **<mqueue.h>**

45037 **CHANGE HISTORY**

45038 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

45039 **Issue 6**

45040 The *mq_getattr*( ) function is marked as part of the Message Passing option.

45041 The [ENOSYS] error condition has been removed as stubs need not be provided if an
45042 implementation does not support the Message Passing option.

The *mq_timedsend*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/61 is applied, updating the ERRORS section to change the [EBADF] error from mandatory to optional.

45047 **NAME**

45048 mq_notify — notify process that a message is available (**REALTIME**)

45049 **SYNOPSIS**

45050 MSG
```
#include <mqueue.h>

int mq_notify(mqd_t mqdes, const struct sigevent *notification);
```

45052 **DESCRIPTION**

45053 If the argument *notification* is not NULL, this function shall register the calling process to be
45054 notified of message arrival at an empty message queue associated with the specified message
45055 queue descriptor, *mqdes*. The notification specified by the *notification* argument shall be sent to
45056 the process when the message queue transitions from empty to non-empty. At any time, only
45057 one process may be registered for notification by a message queue. If the calling process or any
45058 other process has already registered for notification of message arrival at the specified message
45059 queue, subsequent attempts to register for that message queue shall fail.

45060 If *notification* is NULL and the process is currently registered for notification by the specified
45061 message queue, the existing registration shall be removed.

45062 When the notification is sent to the registered process, its registration shall be removed. The
45063 message queue shall then be available for registration.

45064 If a process has registered for notification of message arrival at a message queue and some
45065 thread is blocked in *mq_receive*( ) or *mq_timedreceive*( ) waiting to receive a message when a
45066 message arrives at the queue, the arriving message shall satisfy the appropriate *mq_receive*( ) or
45067 *mq_timedreceive*( ), respectively. The resulting behavior is as if the message queue remains empty,
45068 and no notification shall be sent.

45069 **RETURN VALUE**

45070 Upon successful completion, the *mq_notify*( ) function shall return a value of zero; otherwise, the
45071 function shall return a value of −1 and set *errno* to indicate the error.

45072 **ERRORS**

45073 The *mq_notify*( ) function shall fail if:

45074 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

45075 [EBUSY] A process is already registered for notification by the message queue.

45076 The *mq_notify*( ) function may fail if:

45077 [EINVAL] The *notification* argument is NULL and the process is currently not registered.

45078 **EXAMPLES**

45079 The following program registers a notification request for the message queue named in its
45080 command-line argument. Notification is performed by creating a thread. The thread executes a
45081 function which reads one message from the queue and then terminates the process.

```
45082 #include <pthread.h>
45083 #include <mqueue.h>
45084 #include <assert.h>
45085 #include <stdio.h>
45086 #include <stdlib.h>
45087 #include <unistd.h>

45088 static void                     /* Thread start function */
45089 tfunc(union sigval sv)
45090 {
```

```
45091            struct mq_attr attr;
45092            ssize_t nr;
45093            void *buf;
45094            mqd_t mqdes = *((mqd_t *) sv.sival_ptr);
45095            /* Determine maximum msg size; allocate buffer to receive msg */
45096            if (mq_getattr(mqdes, &attr) == -1) {
45097                perror("mq_getattr");
45098                exit(EXIT_FAILURE);
45099            }
45100            buf = malloc(attr.mq_msgsize);
45101            if (buf == NULL) {
45102                perror("malloc");
45103                exit(EXIT_FAILURE);
45104            }
45105            nr = mq_receive(mqdes, buf, attr.mq_msgsize, NULL);
45106            if (nr == -1) {
45107                perror("mq_receive");
45108                exit(EXIT_FAILURE);
45109            }
45110            printf("Read %ld bytes from message queue\n", (long) nr);
45111            free(buf);
45112            exit(EXIT_SUCCESS);         /* Terminate the process */
45113        }
45114        int
45115        main(int argc, char *argv[])
45116        {
45117            mqd_t mqdes;
45118            struct sigevent not;
45119            assert(argc == 2);
45120            mqdes = mq_open(argv[1], O_RDONLY);
45121            if (mqdes == (mqd_t) -1) {
45122                perror("mq_open");
45123                exit(EXIT_FAILURE);
45124            }
45125            not.sigev_notify = SIGEV_THREAD;
45126            not.sigev_notify_function = tfunc;
45127            not.sigev_notify_attributes = NULL;
45128            not.sigev_value.sival_ptr = &mqdes;   /* Arg. to thread func. */
45129            if (mq_notify(mqdes, &not) == -1) {
45130                perror("mq_notify");
45131                exit(EXIT_FAILURE);
45132            }
45133            pause();    /* Process will be terminated by thread function */
45134        }
```

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_notify*( ) function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The *mq_timedsend*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

Issue 7

SD5-XSH-ERN-38 is applied, adding the *mq_timedreceive*( ) function to the DESCRIPTION.

Austin Group Interpretation 1003.1-2001 #032 is applied, adding the [EINVAL] error.

An example is added.

45156 **NAME**

45157 mq_open ‡'open a message queue (**REALTIME**)

45158 **SYNOPSIS**

45159 MSG
```
#include <mqueue.h>

mqd_t mq_open(const char *name, int oflag, ...);
```

45161 **DESCRIPTION**

45162 The *mq_open*( ) function shall establish the connection between a process and a message queue
45163 with a message queue descriptor. It shall create an open message queue description that refers to
45164 the message queue, and a message queue descriptor that refers to that open message queue
45165 description. The message queue descriptor is used by other functions to refer to that message
45166 queue. The *name* argument points to a string naming a message queue. It is unspecified whether
45167 the name appears in the file system and is visible to other functions that take pathnames as
45168 arguments. The *name* argument conforms to the construction rules for a pathname, except that
45169 the interpretation of <slash> characters other than the leading <slash> character in *name* is
45170 implementation-defined, and that the length limits for the *name* argument are implementation-
45171 defined and need not be the same as the pathname limits {PATH_MAX} and {NAME_MAX}. If
45172 *name* begins with the <slash> character, then processes calling *mq_open*( ) with the same value of
45173 *name* shall refer to the same message queue object, as long as that name has not been removed. If
45174 *name* does not begin with the <slash> character, the effect is implementation-defined. If the *name*
45175 argument is not the name of an existing message queue and creation is not requested, *mq_open*( )
45176 shall fail and return an error.

45177 A message queue descriptor may be implemented using a file descriptor, in which case
45178 applications can open up to at least {OPEN_MAX} file and message queues.

45179 The *oflag* argument requests the desired receive and/or send access to the message queue. The
45180 requested access permission to receive messages or send messages shall be granted if the calling
45181 process would be granted read or write access, respectively, to an equivalently protected file.

45182 The value of *oflag* is the bitwise-inclusive OR of values from the following list. Applications
45183 shall specify exactly one of the first three values (access modes) below in the value of *oflag*:

45184 O_RDONLY Open the message queue for receiving messages. The process can use the
45185 returned message queue descriptor with *mq_receive*( ), but not *mq_send*( ). A
45186 message queue may be open multiple times in the same or different processes
45187 for receiving messages.

45188 O_WRONLY Open the queue for sending messages. The process can use the returned
45189 message queue descriptor with *mq_send*( ) but not *mq_receive*( ). A message
45190 queue may be open multiple times in the same or different processes for
45191 sending messages.

45192 O_RDWR Open the queue for both receiving and sending messages. The process can use
45193 any of the functions allowed for O_RDONLY and O_WRONLY. A message
45194 queue may be open multiple times in the same or different processes for
45195 sending messages.

45196 Any combination of the remaining flags may be specified in the value of *oflag*:

45197 O_CREAT Create a message queue. It requires two additional arguments: *mode*, which
45198 shall be of type **mode_t**, and *attr*, which shall be a pointer to an **mq_attr**
45199 structure. If the pathname *name* has already been used to create a message
45200 queue that still exists, then this flag shall have no effect, except as noted under
45201 O_EXCL. Otherwise, a message queue shall be created without any messages

in it. The user ID of the message queue shall be set to the effective user ID of the process. The group ID of the message queue shall be set to the effective group ID of the process; however, if the *name* argument is visible in the file system, the group ID may be set to the group ID of the containing directory. When bits in *mode* other than the file permission bits are specified, the effect is unspecified. If *attr* is NULL, the message queue shall be created with implementation-defined default message queue attributes. If *attr* is non-NULL and the calling process has appropriate privileges on *name*, the message queue *mq_maxmsg* and *mq_msgsize* attributes shall be set to the values of the corresponding members in the **mq_attr** structure referred to by *attr*. The values of the *mq_flags* and *mq_curmsgs* members of the **mq_attr** structure shall be ignored. If *attr* is non-NULL, but the calling process does not have appropriate privileges on *name*, the *mq_open*( ) function shall fail and return an error without creating the message queue.

O_EXCL — If O_EXCL and O_CREAT are set, *mq_open*( ) shall fail if the message queue *name* exists. The check for the existence of the message queue and the creation of the message queue if it does not exist shall be atomic with respect to other threads executing *mq_open*( ) naming the same *name* with O_EXCL and O_CREAT set. If O_EXCL is set and O_CREAT is not set, the result is undefined.

O_NONBLOCK — Determines whether an *mq_send*( ) or *mq_receive*( ) waits for resources or messages that are not currently available, or fails with *errno* set to [EAGAIN]; see *mq_send*( ) and *mq_receive*( ) for details.

The *mq_open*( ) function does not add or remove messages from the queue.

RETURN VALUE

Upon successful completion, the function shall return a message queue descriptor; otherwise, the function shall return (**mqd_t**)−1 and set *errno* to indicate the error.

ERRORS

The *mq_open*( ) function shall fail if:

[EACCES] The message queue exists and the permissions specified by *oflag* are denied, or the message queue does not exist and permission to create the message queue is denied.

[EEXIST] O_CREAT and O_EXCL are set and the named message queue already exists.

[EINTR] The *mq_open*( ) function was interrupted by a signal.

[EINVAL] The *mq_open*( ) function is not supported for the given name.

[EINVAL] O_CREAT was specified in *oflag*, the value of *attr* is not NULL, and either *mq_maxmsg* or *mq_msgsize* was less than or equal to zero.

[EMFILE] Too many message queue descriptors or file descriptors are currently in use by this process.

[ENFILE] Too many message queues are currently open in the system.

[ENOENT] O_CREAT is not set and the named message queue does not exist.

[ENOSPC] There is insufficient space for the creation of the new message queue.

If any of the following conditions occur, the *mq_open*( ) function may return (**mqd_t**)−1 and set *errno* to the corresponding value.

[ENAMETOOLONG]
The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems that do not support the XSI option XSI or exceeds {_XOPEN_PATH_MAX} on XSI systems, or has a pathname component that is longer than {_POSIX_NAME_MAX} on systems that do not support the XSI option XSI or longer than {_XOPEN_NAME_MAX} on XSI systems.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

A future version might require the *mq_open*( ) and *mq_unlink*( ) functions to have semantics similar to normal file system operations.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_open*( ) function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The *mq_timedreceive*( ) and *mq_timedsend*( ) functions are added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

The DESCRIPTION of O_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/62 is applied, updating the description of the permission bits in the DESCRIPTION. The change is made for consistency with the *shm_open*( ) and *sem_open*( ) functions.

Issue 7

Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and changing [ENAMETOOLONG] from a ``shall fail'' to a ``may fail'' error.

Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the user ID and group ID of the message queue.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0394 [259] is applied.

NAME

mq_receive, mq_timedreceive — receive a message from a message queue (**REALTIME**)

SYNOPSIS

MSG

```
#include <mqueue.h>

ssize_t mq_receive(mqd_t mqdes, char *msg_ptr, size_t msg_len,
    unsigned *msg_prio);

#include <mqueue.h>
#include <time.h>

ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
    size_t msg_len, unsigned *restrict msg_prio,
    const struct timespec *restrict abstime);
```

DESCRIPTION

The *mq_receive*( ) function shall receive the oldest of the highest priority message(s) from the message queue specified by *mqdes*. If the size of the buffer in bytes, specified by the *msg_len* argument, is less than the *mq_msgsize* attribute of the message queue, the function shall fail and return an error. Otherwise, the selected message shall be removed from the queue and copied to the buffer pointed to by the *msg_ptr* argument.

If the value of *msg_len* is greater than {SSIZE_MAX}, the result is implementation-defined.

If the argument *msg_prio* is not NULL, the priority of the selected message shall be stored in the location referenced by *msg_prio*.

If the specified message queue is empty and O_NONBLOCK is not set in the message queue description associated with *mqdes*, *mq_receive*( ) shall block until a message is enqueued on the message queue or until *mq_receive*( ) is interrupted by a signal. If more than one thread is waiting to receive a message when a message arrives at an empty queue and the Priority Scheduling option is supported, then the thread of highest priority that has been waiting the longest shall be selected to receive the message. Otherwise, it is unspecified which waiting thread receives the message. If the specified message queue is empty and O_NONBLOCK is set in the message queue description associated with *mqdes*, no message shall be removed from the queue, and *mq_receive*( ) shall return an error.

The *mq_timedreceive*( ) function shall receive the oldest of the highest priority messages from the message queue specified by *mqdes* as described for the *mq_receive*( ) function. However, if O_NONBLOCK was not specified when the message queue was opened via the *mq_open*( ) function, and no message exists on the queue to satisfy the receive, the wait for such a message shall be terminated when the specified timeout expires. If O_NONBLOCK is set, this function is equivalent to *mq_receive*( ).

The timeout expires when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the clock on which it is based. The *timespec* argument is defined in the **<time.h>** header.

Under no circumstance shall the operation fail with a timeout if a message can be removed from the message queue immediately. The validity of the *abstime* parameter need not be checked if a message can be removed from the message queue immediately.

RETURN VALUE

Upon successful completion, the *mq_receive*( ) and *mq_timedreceive*( ) functions shall return the length of the selected message in bytes and the message shall be removed from the queue. Otherwise, no message shall be removed from the queue, the functions shall return a value of –1, and set *errno* to indicate the error.

ERRORS

These functions shall fail if:

[EAGAIN] O_NONBLOCK was set in the message description associated with *mqdes*, and the specified message queue is empty.

[EBADF] The *mqdes* argument is not a valid message queue descriptor open for reading.

[EMSGSIZE] The specified message buffer size, *msg_len*, is less than the message size attribute of the message queue.

[EINTR] The *mq_receive*( ) or *mq_timedreceive*( ) operation was interrupted by a signal.

[EINVAL] The process or thread would have blocked, and the *abstime* parameter specified a nanoseconds field value less than zero or greater than or equal to 1 000 million.

[ETIMEDOUT] The O_NONBLOCK flag was not set when the message queue was opened, but no message arrived on the queue before the specified timeout expired.

These functions may fail if:

[EBADMSG] The implementation has detected a data corruption problem with the message.

mq_open( ), *mq_send*( ), *msgctl*( ), *msgget*( ), *msgrcv*( ), *msgsnd*( ), *time*( )

XBD **<mqueue.h>**, **<time.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_receive*( ) function is marked as part of the Message Passing option.

The Open Group Corrigendum U021/4 is applied. The DESCRIPTION is changed to refer to *msg_len* rather than *maxsize*.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

In this function it is possible for the return value to exceed the range of the type **ssize_t** (since **size_t** has a larger range of positive values than **ssize_t**). A sentence restricting the size of the **size_t** object is added to the description to resolve this conflict.

The *mq_timedreceive*( ) function is added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *mq_timedreceive*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE PASC Interpretation 1003.1 #109 is applied, correcting the return type for *mq_timedreceive*( ) from **int** to **ssize_t**.

Issue 7

The *mq_timedreceive*( ) function is moved from the Timeouts option to the Base.

Functionality relating to the Timers option is moved to the Base.

NAME

mq_send, mq_timedsend ‡'send a message to a message queue (**REALTIME**)

SYNOPSIS

MSG

```
#include <mqueue.h>

int mq_send(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
    unsigned msg_prio);

#include <mqueue.h>
#include <time.h>

int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
    unsigned msg_prio, const struct timespec *abstime);
```

DESCRIPTION

The *mq_send*( ) function shall add the message pointed to by the argument *msg_ptr* to the message queue specified by *mqdes*. The *msg_len* argument specifies the length of the message, in bytes, pointed to by *msg_ptr*. The value of *msg_len* shall be less than or equal to the *mq_msgsize* attribute of the message queue, or *mq_send*( ) shall fail.

If the specified message queue is not full, *mq_send*( ) shall behave as if the message is inserted into the message queue at the position indicated by the *msg_prio* argument. A message with a larger numeric value of *msg_prio* shall be inserted before messages with lower values of *msg_prio*. A message shall be inserted after other messages in the queue, if any, with equal *msg_prio*. The value of *msg_prio* shall be less than {MQ_PRIO_MAX}.

If the specified message queue is full and O_NONBLOCK is not set in the message queue description associated with *mqdes*, *mq_send*( ) shall block until space becomes available to enqueue the message, or until *mq_send*( ) is interrupted by a signal. If more than one thread is waiting to send when space becomes available in the message queue and the Priority Scheduling option is supported, then the thread of the highest priority that has been waiting the longest shall be unblocked to send its message. Otherwise, it is unspecified which waiting thread is unblocked. If the specified message queue is full and O_NONBLOCK is set in the message queue description associated with *mqdes*, the message shall not be queued and *mq_send*( ) shall return an error.

The *mq_timedsend*( ) function shall add a message to the message queue specified by *mqdes* in the manner defined for the *mq_send*( ) function. However, if the specified message queue is full and O_NONBLOCK is not set in the message queue description associated with *mqdes*, the wait for sufficient room in the queue shall be terminated when the specified timeout expires. If O_NONBLOCK is set in the message queue description, this function shall be equivalent to *mq_send*( ).

The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the clock on which it is based. The *timespec* argument is defined in the **<time.h>** header.

Under no circumstance shall the operation fail with a timeout if there is sufficient room in the queue to add the message immediately. The validity of the *abstime* parameter need not be checked when there is sufficient room in the queue.

RETURN VALUE

Upon successful completion, the *mq_send*( ) and *mq_timedsend*( ) functions shall return a value of zero. Otherwise, no message shall be enqueued, the functions shall return –1, and *errno* shall be set to indicate the error.

ERRORS

The *mq_send*( ) and *mq_timedsend*( ) functions shall fail if:

[EAGAIN] The O_NONBLOCK flag is set in the message queue description associated with *mqdes*, and the specified message queue is full.

[EBADF] The *mqdes* argument is not a valid message queue descriptor open for writing.

[EINTR] A signal interrupted the call to *mq_send*( ) or *mq_timedsend*( ).

[EINVAL] The value of *msg_prio* was outside the valid range.

[EINVAL] The process or thread would have blocked, and the *abstime* parameter specified a nanoseconds field value less than zero or greater than or equal to 1 000 million.

[EMSGSIZE] The specified message length, *msg_len*, exceeds the message size attribute of the message queue.

[ETIMEDOUT] The O_NONBLOCK flag was not set when the message queue was opened, but the timeout expired before the message could be added to the queue.

EXAMPLES

None.

APPLICATION USAGE

The value of the symbol {MQ_PRIO_MAX} limits the number of priority levels supported by the application. Message priorities range from 0 to {MQ_PRIO_MAX}–1.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_send*( ) function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The *mq_timedsend*( ) function is added for alignment with IEEE Std 1003.1d-1999.

Issue 7

The *mq_timedsend*( ) function is moved from the Timeouts option to the Base.

Functionality relating to the Timers option is moved to the Base.

45467 **NAME**

45468 mq_setattr ‡’set message queue attributes (**REALTIME**)

45469 **SYNOPSIS**

45470 MSG
```
#include <mqueue.h>

int mq_setattr(mqd_t mqdes, const struct mq_attr *restrict mqstat,
    struct mq_attr *restrict omqstat);
```

45473 **DESCRIPTION**

45474 The *mq_setattr*( ) function shall set attributes associated with the open message queue
45475 description referenced by the message queue descriptor specified by *mqdes*.

45476 The message queue attributes corresponding to the following members defined in the **mq_attr**
45477 structure shall be set to the specified values upon successful completion of *mq_setattr*( ):

45478 *mq_flags* The value of this member is the bitwise-logical OR of zero or more of
45479 O_NONBLOCK and any implementation-defined flags.

45480 The values of the *mq_maxmsg*, *mq_msgsize*, and *mq_curmsgs* members of the **mq_attr** structure
45481 shall be ignored by *mq_setattr*( ).

45482 If *omqstat* is non-NULL, the *mq_setattr*( ) function shall store, in the location referenced by
45483 *omqstat*, the previous message queue attributes and the current queue status. These values shall
45484 be the same as would be returned by a call to *mq_getattr*( ) at that point.

45485 **RETURN VALUE**

45486 Upon successful completion, the function shall return a value of zero and the attributes of the
45487 message queue shall have been changed as specified.

45488 Otherwise, the message queue attributes shall be unchanged, and the function shall return a
45489 value of –1 and set *errno* to indicate the error.

45490 **ERRORS**

45491 The *mq_setattr*( ) function shall fail if:

45492 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

45501 **SEE ALSO**

45502 *mq_open*( ), *mq_send*( ), *msgctl*( ), *msgget*( ), *msgrcv*( ), *msgsnd*( )

45503 XBD **<mqueue.h>**

45504 **CHANGE HISTORY**

45505 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_setattr*( ) function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The *mq_timedsend*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *mq_setattr*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

NAME

mq_timedreceive — receive a message from a message queue (**ADVANCED REALTIME**)

SYNOPSIS

MSG

```
#include <mqueue.h>
#include <time.h>

ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
    size_t msg_len, unsigned *restrict msg_prio,
    const struct timespec *restrict abstime);
```

DESCRIPTION

Refer to *mq_receive*( ).

45524 **NAME**

45525 mq_timedsend ‡′send a message to a message queue (**ADVANCED REALTIME**)

45526 **SYNOPSIS**

45527 MSG
```
#include <mqueue.h>
#include <time.h>

int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
    unsigned msg_prio, const struct timespec *abstime);
```

45531 **DESCRIPTION**

45532 Refer to *mq_send( )*.

45533 **NAME**

45534 mq_unlink — remove a message queue (**REALTIME**)

45535 **SYNOPSIS**

45536 MSG
```
#include <mqueue.h>

int mq_unlink(const char *name);
```
45537

45538 **DESCRIPTION**

45539 The *mq_unlink*( ) function shall remove the message queue named by the string name. If one or
45540 more processes have the message queue open when *mq_unlink*( ) is called, destruction of the
45541 message queue shall be postponed until all references to the message queue have been closed.
45542 However, the *mq_unlink*( ) call need not block until all references have been closed; it may return
45543 immediately.

45544 After a successful call to *mq_unlink*( ), reuse of the name shall subsequently cause *mq_open*( ) to
45545 behave as if no message queue of this name exists (that is, *mq_open*( ) will fail if O_CREAT is not
45546 set, or will create a new message queue if O_CREAT is set).

45547 **RETURN VALUE**

45548 Upon successful completion, the function shall return a value of zero. Otherwise, the named
45549 message queue shall be unchanged by this function call, and the function shall return a value of
45550 −1 and set *errno* to indicate the error.

45551 **ERRORS**

45552 The *mq_unlink*( ) function shall fail if:

45553 [EACCES] Permission is denied to unlink the named message queue.

45554 [EINTR] The call to *mq_unlink*( ) blocked waiting for all references to the named
45555 message queue to be closed and a signal interrupted the call.

45556 [ENOENT] The named message queue does not exist.

45557 The *mq_unlink*( ) function may fail if:

45558 [ENAMETOOLONG]
45559 The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems
45560 XSI that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI
45561 systems, or has a pathname component that is longer than
45562 XSI {_POSIX_NAME_MAX} on systems that do not support the XSI option or
45563 longer than {_XOPEN_NAME_MAX} on XSI systems. A call to *mq_unlink*( )
45564 with a *name* argument that contains the same message queue name as was
45565 previously used in a successful *mq_open*( ) call shall not give an
45566 [ENAMETOOLONG] error.

45567 **EXAMPLES**

45568 None.

45569 **APPLICATION USAGE**

45570 None.

45571 **RATIONALE**

45572 None.

FUTURE DIRECTIONS

A future version might require the *mq_open*( ) and *mq_unlink*( ) functions to have semantics similar to normal file system operations.

SEE ALSO

XBD **<mqueue.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_unlink*( ) function is marked as part of the Message Passing option.

The Open Group Corrigendum U021/5 is applied, clarifying that upon unsuccessful completion, the named message queue is unchanged by this function.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

Issue 7

Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a ``shall fail'' to a ``may fail'' error .

Austin Group Interpretation 1003.1-2001 #141 is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0230 [504] is applied.

45592 **NAME**

45593 mrand48 ‡'generate uniformly distributed pseudo-random signed long integers

45594 **SYNOPSIS**

45595 XSI
```
#include <stdlib.h>

```

45597 **DESCRIPTION**

45598 Refer to *drand48( )*.

NAME

msgctl — XSI message control operations

SYNOPSIS

XSI
```
#include <sys/msg.h>

int msgctl(int msqid, int cmd, struct msqid_ds *buf);
```

DESCRIPTION

The *msgctl*( ) function operates on XSI message queues (see XBD Section 3.226, on page 69). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 503).

The *msgctl*( ) function shall provide message control operations as specified by *cmd*. The following values for *cmd*, and the message control operations they specify, are:

IPC_STAT
: Place the current value of each member of the **msqid_ds** data structure associated with *msqid* into the structure pointed to by *buf*. The contents of this structure are defined in **<sys/msg.h>**.

IPC_SET
: Set the value of the following members of the **msqid_ds** data structure associated with *msqid* to the corresponding value found in the structure pointed to by *buf*:

```
msg_perm.uid
msg_perm.gid
msg_perm.mode
msg_qbytes
```

Also, the *msg_ctime* timestamp shall be set to the current time, as described in Section 2.7.1 (on page 502).

IPC_SET can only be executed by a process with appropriate privileges or that has an effective user ID equal to the value of **msg_perm.cuid** or **msg_perm.uid** in the **msqid_ds** data structure associated with *msqid*. Only a process with appropriate privileges can raise the value of **msg_qbytes**.

IPC_RMID
: Remove the message queue identifier specified by *msqid* from the system and destroy the message queue and **msqid_ds** data structure associated with it. IPC_RMD can only be executed by a process with appropriate privileges or one that has an effective user ID equal to the value of **msg_perm.cuid** or **msg_perm.uid** in the **msqid_ds** data structure associated with *msqid*.

RETURN VALUE

Upon successful completion, *msgctl*( ) shall return 0; otherwise, it shall return −1 and set *errno* to indicate the error.

ERRORS

The *msgctl*( ) function shall fail if:

[EACCES]
: The argument *cmd* is IPC_STAT and the calling process does not have read permission; see Section 2.7 (on page 501).

[EINVAL]
: The value of *msqid* is not a valid message queue identifier; or the value of *cmd* is not a valid command.

[EPERM]
: The argument *cmd* is IPC_RMID or IPC_SET and the effective user ID of the calling process is not equal to that of a process with appropriate privileges and it is not equal to the value of **msg_perm.cuid** or **msg_perm.uid** in the data

45643 structure associated with *msqid*.

45644 [EPERM] The argument *cmd* is IPC_SET, an attempt is being made to increase to the
45645 value of **msg_qbytes**, and the effective user ID of the calling process does not
45646 have appropriate privileges.

45647 **EXAMPLES**

45648 None.

45649 **APPLICATION USAGE**

45650 The POSIX Realtime Extension defines alternative interfaces for interprocess communication
45651 (IPC). Application developers who need to use IPC should design their applications so that
45652 modules using the IPC routines described in Section 2.7 (on page 501) can be easily modified to
45653 use the alternative interfaces.

45654 **RATIONALE**

45655 None.

45656 **FUTURE DIRECTIONS**

45657 None.

45658 **SEE ALSO**

45659 Section 2.7 (on page 501), Section 2.8 (on page 503), *mq_close( )*, *mq_getattr( )*, *mq_notify( )*,

45662 **CHANGE HISTORY**

45663 First released in Issue 2. Derived from Issue 2 of the SVID.

45664 **Issue 5**

45665 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE
45666 DIRECTIONS to a new APPLICATION USAGE section.

45667 **Issue 7**

45668 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0395 [345] is applied.

45669 **NAME**

45670 msgget ‡'get the XSI message queue identifier

45671 **SYNOPSIS**

45672 XSI
```
#include <sys/msg.h>
```
45673
```
int msgget(key_t key, int msgflg);
```

45674 **DESCRIPTION**

45675 The *msgget*( ) function operates on XSI message queues (see XBD Section 3.226, on page 69). It is
45676 unspecified whether this function interoperates with the realtime interprocess communication
45677 facilities defined in Section 2.8 (on page 503).

45678 The *msgget*( ) function shall return the message queue identifier associated with the argument
45679 *key*.

45680 A message queue identifier, associated message queue, and data structure (see **<sys/msg.h>**),
45681 shall be created for the argument *key* if one of the following is true:

45682 The argument *key* is equal to IPC_PRIVATE.

45683 The argument *key* does not already have a message queue identifier associated with it, and
45684 (*msgflg* & IPC_CREAT) is non-zero.

45685 Upon creation, the data structure associated with the new message queue identifier shall be
45686 initialized as follows:

45687 **msg_perm.cuid**, **msg_perm.uid**, **msg_perm.cgid**, and **msg_perm.gid** shall be set to the
45688 effective user ID and effective group ID, respectively, of the calling process.

45689 The low-order 9 bits of **msg_perm.mode** shall be set to the low-order 9 bits of *msgflg*.

45690 **msg_qnum**, **msg_lspid**, **msg_lrpid**, **msg_stime**, and **msg_rtime** shall be set to 0.

45691 **msg_ctime** shall be set to the current time, as described in Section 2.7.1 (on page 502).

45692 **msg_qbytes** shall be set to the system limit.

45693 **RETURN VALUE**

45694 Upon successful completion, *msgget*( ) shall return a non-negative integer, namely a message
45695 queue identifier. Otherwise, it shall return –1 and set *errno* to indicate the error.

45696 **ERRORS**

45697 The *msgget*( ) function shall fail if:

45698 [EACCES] A message queue identifier exists for the argument *key*, but operation
45699 permission as specified by the low-order 9 bits of *msgflg* would not be granted;
45700 see Section 2.7 (on page 501).

45701 [EEXIST] A message queue identifier exists for the argument *key* but ((*msgflg* &
45702 IPC_CREAT) && (*msgflg* & IPC_EXCL)) is non-zero.

45703 [ENOENT] A message queue identifier does not exist for the argument *key* and (*msgflg* &
45704 IPC_CREAT) is 0.

45705 [ENOSPC] A message queue identifier is to be created but the system-imposed limit on
45706 the maximum number of allowed message queue identifiers system-wide
45707 would be exceeded.

45708 **EXAMPLES**

45709 None.

45710 **APPLICATION USAGE**

45711 The POSIX Realtime Extension defines alternative interfaces for interprocess communication
45712 (IPC). Application developers who need to use IPC should design their applications so that
45713 modules using the IPC routines described in Section 2.7 (on page 501) can be easily modified to
45714 use the alternative interfaces.

45730 [344] are applied.

NAME

msgrcv — XSI message receive operation

SYNOPSIS

XSI
```
#include <sys/msg.h>

ssize_t msgrcv(int msqid, void *msgp, size_t msgsz, long msgtyp,
    int msgflg);
```

DESCRIPTION

The *msgrcv*( ) function operates on XSI message queues (see XBD Section 3.226, on page 69). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 503).

The *msgrcv*( ) function shall read a message from the queue associated with the message queue identifier specified by *msqid* and place it in the user-defined buffer pointed to by *msgp*.

The application shall ensure that the argument *msgp* points to a user-defined buffer that contains first a field of type **long** specifying the type of the message, and then a data portion that holds the data bytes of the message. The structure below is an example of what this user-defined buffer might look like:

```
struct mymsg {
    long    mtype;     /* Message type. */
    char    mtext[1];  /* Message text. */
}
```

The structure member *mtype* is the received message's type as specified by the sending process.

The structure member *mtext* is the text of the message.

The argument *msgsz* specifies the size in bytes of *mtext*. The received message shall be truncated to *msgsz* bytes if it is larger than *msgsz* and (*msgflg* & MSG_NOERROR) is non-zero. The truncated part of the message shall be lost and no indication of the truncation shall be given to the calling process.

If the value of *msgsz* is greater than {SSIZE_MAX}, the result is implementation-defined.

The argument *msgtyp* specifies the type of message requested as follows:

If *msgtyp* is 0, the first message on the queue shall be received.

If *msgtyp* is greater than 0, the first message of type *msgtyp* shall be received.

If *msgtyp* is less than 0, the first message of the lowest type that is less than or equal to the absolute value of *msgtyp* shall be received.

The argument *msgflg* specifies the action to be taken if a message of the desired type is not on the queue. These are as follows:

If (*msgflg* & IPC_NOWAIT) is non-zero, the calling thread shall return immediately with a return value of −1 and *errno* set to [ENOMSG].

If (*msgflg* & IPC_NOWAIT) is 0, the calling thread shall suspend execution until one of the following occurs:

- A message of the desired type is placed on the queue.
- The message queue identifier *msqid* is removed from the system; when this occurs, *errno* shall be set to [EIDRM] and −1 shall be returned.

45772 ‡ The calling thread receives a signal that is to be caught; in this case a message is not
45773 received and the calling thread resumes execution in the manner prescribed in
45774 *sigaction*( ).

45775 Upon successful completion, the following actions are taken with respect to the data structure
45776 associated with *msqid*:

45777 **msg_qnum** shall be decremented by 1.

45778 **msg_lrpid** shall be set to the process ID of the calling process.

45779 **msg_rtime** shall be set to the current time, as described in Section 2.7.1 (on page 502).

45780 **RETURN VALUE**

45781 Upon successful completion, *msgrcv*( ) shall return a value equal to the number of bytes actually
45782 placed into the buffer *mtext*. Otherwise, no message shall be received, *msgrcv*( ) shall return –1,
45783 and *errno* shall be set to indicate the error.

45784 **ERRORS**

45785 The *msgrcv*( ) function shall fail if:

45786 [E2BIG] The value of *mtext* is greater than *msgsz* and (*msgflg* & MSG_NOERROR) is 0.

45787 [EACCES] Operation permission is denied to the calling process; see Section 2.7 (on page
45788 501).

45789 [EIDRM] The message queue identifier *msqid* is removed from the system.

45790 [EINTR] The *msgrcv*( ) function was interrupted by a signal.

45791 [EINVAL] *msqid* is not a valid message queue identifier.

45792 [ENOMSG] The queue does not contain a message of the desired type and (*msgflg* &
45793 IPC_NOWAIT) is non-zero.

45794 **EXAMPLES**

45795 **Receiving a Message**

45796 The following example receives the first message on the queue (based on the value of the *msgtyp*
45797 argument, 0). The queue is identified by the *msqid* argument (assuming that the value has
45798 previously been set). This call specifies that an error should be reported if no message is
45799 available, but not if the message is too large. The message size is calculated directly using the
45800 *sizeof* operator.

```
45801 #include <sys/msg.h>
45802 ...
45803 int result;
45804 int msqid;
45805 struct message {
45806     long type;
45807     char text[20];
45808 } msg;
45809 long msgtyp = 0;
45810 ...
45811 result = msgrcv(msqid, (void *) &msg, sizeof(msg.text),
45812          msgtyp, MSG_NOERROR | IPC_NOWAIT);
```

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication (IPC). Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 501) can be easily modified to use the alternative interfaces.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 3.226 (on page 69), **<sys/msg.h>**

CHANGE HISTORY

First released in Issue 2. Derived from Issue 2 of the SVID.

Issue 5

The type of the return value is changed from **int** to **ssize_t**, and a warning is added to the DESCRIPTION about values of *msgsz* larger the {SSIZE_MAX}.

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to the APPLICATION USAGE section.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0398 [345] and XSH/TC1-2008/0399 [421] are applied.

45839 **NAME**

45840 msgsnd ‡'XSI message send operation

45841 **SYNOPSIS**

45842 XSI
```
#include <sys/msg.h>

int msgsnd(int msqid, const void *msgp, size_t msgsz, int msgflg);
```
45843

45844 **DESCRIPTION**

45845 The *msgsnd*( ) function operates on XSI message queues (see XBD Section 3.226, on page 69). It is
45846 unspecified whether this function interoperates with the realtime interprocess communication
45847 facilities defined in Section 2.8 (on page 503).

45848 The *msgsnd*( ) function shall send a message to the queue associated with the message queue
45849 identifier specified by *msqid*.

45850 The application shall ensure that the argument *msgp* points to a user-defined buffer that contains
45851 first a field of type **long** specifying the type of the message, and then a data portion that holds
45852 the data bytes of the message. The structure below is an example of what this user-defined
45853 buffer might look like:

45854
```
struct mymsg {
    long    mtype;       /* Message type. */
    char    mtext[1];    /* Message text. */
}
```
45857

45858 The structure member *mtype* is a non-zero positive type **long** that can be used by the receiving
45859 process for message selection.

45860 The structure member *mtext* is any text of length *msgsz* bytes. The argument *msgsz* can range
45861 from 0 to a system-imposed maximum.

45862 The argument *msgflg* specifies the action to be taken if one or more of the following is true:

45863 The number of bytes already on the queue is equal to **msg_qbytes**; see **<sys/msg.h>**.

45864 The total number of messages on all queues system-wide is equal to the system-imposed
45865 limit.

45866 These actions are as follows:

45867 If (*msgflg* & IPC_NOWAIT) is non-zero, the message shall not be sent and the calling
45868 thread shall return immediately.

45869 If (*msgflg* & IPC_NOWAIT) is 0, the calling thread shall suspend execution until one of the
45870 following occurs:

45871 ‡ĥéTcondition responsible for the suspension no longer exists, in which case the
45872 message is sent.

45873 ‡ĥéTmessage queue identifier *msqid* is removed from the system; when this occurs,
45874 *errno* shall be set to [EIDRM] and −1 shall be returned.

45875 ‡ĥéTcalling thread receives a signal that is to be caught; in this case the message is not
45876 sent and the calling thread resumes execution in the manner prescribed in *sigaction*( ).

Upon successful completion, the following actions are taken with respect to the data structure associated with *msqid*; see **<sys/msg.h>**:

msg_qnum shall be incremented by 1.

msg_lspid shall be set to the process ID of the calling process.

msg_stime shall be set to the current time, as described in Section 2.7.1 (on page 502).

RETURN VALUE

Upon successful completion, *msgsnd*( ) shall return 0; otherwise, no message shall be sent, *msgsnd*( ) shall return –1, and *errno* shall be set to indicate the error.

ERRORS

The *msgsnd*( ) function shall fail if:

[EACCES] Operation permission is denied to the calling process; see Section 2.7 (on page 501).

[EAGAIN] The message cannot be sent for one of the reasons cited above and (*msgflg* & IPC_NOWAIT) is non-zero.

[EIDRM] The message queue identifier *msqid* is removed from the system.

[EINTR] The *msgsnd*( ) function was interrupted by a signal.

[EINVAL] The value of *msqid* is not a valid message queue identifier, or the value of *mtype* is less than 1; or the value of *msgsz* is greater than the system-imposed limit.

EXAMPLES

Sending a Message

The following example sends a message to the queue identified by the *msqid* argument (assuming that value has previously been set). This call specifies that an error should be reported if no message is available. The message size is calculated directly using the *sizeof* operator.

```
#include <sys/msg.h>
...
int result;
int msqid;
struct message {
    long type;
    char text[20];
} msg;

msg.type = 1;
strcpy(msg.text, "This is message 1");
...
result = msgsnd(msqid, (void *) &msg, sizeof(msg.text), IPC_NOWAIT);
```

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication (IPC). Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 501) can be easily modified to use the alternative interfaces.

45928 **CHANGE HISTORY**

45929 First released in Issue 2. Derived from Issue 2 of the SVID.

45930 **Issue 5**

45931 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE
45932 DIRECTIONS to a new APPLICATION USAGE section.

45933 **Issue 6**

45934 The normative text is updated to avoid use of the term ``must'' for application requirements.

45935 **Issue 7**

45936 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0400 [345] and XSH/TC1-2008/0401
45937 [359] are applied.

NAME

msync — synchronize memory with physical storage

SYNOPSIS

XSI|SIO
```
#include <sys/mman.h>

int msync(void *addr, size_t len, int flags);
```

DESCRIPTION

The *msync*( ) function shall write all modified data to permanent storage locations, if any, in those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes. If no such storage exists, *msync*( ) need not have any effect. If requested, the *msync*( ) function shall then invalidate cached copies of data.

The implementation may require that *addr* be a multiple of the page size as returned by *sysconf*( ).

For mappings to files, the *msync*( ) function shall ensure that all write operations are completed as defined for synchronized I/O data integrity completion. It is unspecified whether the implementation also writes out other file attributes. When the *msync*( ) function is called on MAP_PRIVATE mappings, any modified data shall not be written to the underlying object and shall not cause such data to be made visible to other processes. It is unspecified whether data in
SHM|TYM MAP_PRIVATE mappings has any permanent storage locations. The effect of *msync*( ) on a shared memory object or a typed memory object is unspecified. The behavior of this function is unspecified if the mapping was not established by a call to *mmap*( ).

The *flags* argument is constructed from the bitwise-inclusive OR of one or more of the following flags defined in the **<sys/mman.h>** header:

Symbolic Constant	Description
MS_ASYNC	Perform asynchronous writes.
MS_SYNC	Perform synchronous writes.
MS_INVALIDATE	Invalidate cached data.

When MS_ASYNC is specified, *msync*( ) shall return immediately once all the write operations are initiated or queued for servicing; when MS_SYNC is specified, *msync*( ) shall not return until all write operations are completed as defined for synchronized I/O data integrity completion. Either MS_ASYNC or MS_SYNC shall be specified, but not both.

When MS_INVALIDATE is specified, *msync*( ) shall invalidate all cached copies of mapped data that are inconsistent with the permanent storage locations such that subsequent references shall obtain data that was consistent with the permanent storage locations sometime between the call to *msync*( ) and the first subsequent memory reference to the data.

If *msync*( ) causes any write to a file, the file's last data modification and last file status change timestamps shall be marked for update.

RETURN VALUE

Upon successful completion, *msync*( ) shall return 0; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *msync*( ) function shall fail if:

[EBUSY] Some or all of the addresses in the range starting at *addr* and continuing for *len* bytes are locked, and MS_INVALIDATE is specified.

[EINVAL] The value of *flags* is invalid.

[ENOMEM] The addresses in the range starting at *addr* and continuing for *len* bytes are outside the range allowed for the address space of a process or specify one or more pages that are not mapped.

The *msync*( ) function may fail if:

[EINVAL] The value of *addr* is not a multiple of the page size as returned by *sysconf*( ).

EXAMPLES

None.

APPLICATION USAGE

The *msync*( ) function is only supported if the Synchronized Input and Output option is supported, and thus need not be available on all implementations.

The *msync*( ) function should be used by programs that require a memory object to be in a known state; for example, in building transaction facilities.

Normal system activity can cause pages to be written to disk. Therefore, there are no guarantees that *msync*( ) is the only control over when pages are or are not written to disk.

RATIONALE

The *msync*( ) function writes out data in a mapped region to the permanent storage for the underlying object. The call to *msync*( ) ensures data integrity of the file.

After the data is written out, any cached data may be invalidated if the MS_INVALIDATE flag was specified. This is useful on systems that do not support read/write consistency.

FUTURE DIRECTIONS

None.

SEE ALSO

mmap( ), *sysconf*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Aligned with *msync*( ) in the POSIX Realtime Extension as follows:

The DESCRIPTION is extensively reworded.

[EBUSY] and a new form of [EINVAL] are added as mandatory error conditions.

Issue 6

The *msync*( ) function is marked as part of the Memory Mapped Files and Synchronized Input and Output options.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

The [EBUSY] mandatory error condition is added.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of the page size.

The second [EINVAL] error condition is made mandatory.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding reference to typed memory objects.

Issue 7

Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment requirements.

SD5-XSH-ERN-110 is applied.

The *msync*( ) function is marked as part of the Synchronized Input and Output option or XSI option as the Memory Mapped Files is moved to the Base.

Changes are made related to support for finegrained timestamps.

NAME

munlock — unlock a range of process address space

SYNOPSIS

MLR

```
#include <sys/mman.h>

int munlock(const void *addr, size_t len);
```

DESCRIPTION

Refer to *mlock*( ).

NAME

munlockall — unlock the address space of a process

SYNOPSIS

ML

```
#include <sys/mman.h>

int munlockall(void);
```

DESCRIPTION

Refer to *mlockall( )*.

46046 **NAME**

46047 munmap ‡'unmap pages of memory

46048 **SYNOPSIS**

46049 `#include <sys/mman.h>`

46050 `int munmap(void *addr, size_t len);`

46051 **DESCRIPTION**

46052 The *munmap*( ) function shall remove any mappings for those entire pages containing any part of
46053 the address space of the process starting at *addr* and continuing for *len* bytes. Further references
46054 to these pages shall result in the generation of a SIGSEGV signal to the process. If there are no
46055 mappings in the specified address range, then *munmap*( ) has no effect.

46056 The implementation may require that *addr* be a multiple of the page size as returned by
46057 *sysconf*( ).

46058 If a mapping to be removed was private, any modifications made in this address range shall be
46059 discarded.

46060 ML | MLR Any memory locks (see *mlock*( ) and *mlockall*( )) associated with this address range shall be
46061 removed, as if by an appropriate call to *munlock*( ).

46062 TYM If a mapping removed from a typed memory object causes the corresponding address range of
46063 the memory pool to be inaccessible by any process in the system except through allocatable
46064 mappings (that is, mappings of typed memory objects opened with the
46065 POSIX_TYPED_MEM_MAP_ALLOCATABLE flag), then that range of the memory pool shall
46066 become deallocated and may become available to satisfy future typed memory allocation
46067 requests.

46068 A mapping removed from a typed memory object opened with the
46069 POSIX_TYPED_MEM_MAP_ALLOCATABLE flag shall not affect in any way the availability of
46070 that typed memory for allocation.

46071 The behavior of this function is unspecified if the mapping was not established by a call to
46072 *mmap*( ).

46073 **RETURN VALUE**

46074 Upon successful completion, *munmap*( ) shall return 0; otherwise, it shall return –1 and set *errno*
46075 to indicate the error.

46076 **ERRORS**

46077 The *munmap*( ) function shall fail if:

46078 [EINVAL] Addresses in the range [*addr*,*addr*+*len*) are outside the valid range for the
46079 address space of a process.

46080 [EINVAL] The *len* argument is 0.

46081 The *munmap*( ) function may fail if:

46082 [EINVAL] The *addr* argument is not a multiple of the page size as returned by *sysconf*( ).

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *munmap*( ) function corresponds to SVR4, just as the *mmap*( ) function does.

It is possible that an application has applied process memory locking to a region that contains shared memory. If this has occurred, the *munmap*( ) call ignores those locks and, if necessary, causes those locks to be removed.

Most implementations require that *addr* is a multiple of the page size as returned by *sysconf*( ).

FUTURE DIRECTIONS

None.

SEE ALSO

mlock( ), *mlockall*( ), *mmap*( ), *posix_typed_mem_open*( ), *sysconf*( )

XBD **<sys/mman.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Aligned with *munmap*( ) in the POSIX Realtime Extension as follows:

- The DESCRIPTION is extensively reworded.
- The SIGBUS error is no longer permitted to be generated.

Issue 6

The *munmap*( ) function is marked as part of the Memory Mapped Files and Shared Memory Objects option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of the page size.
- The [EINVAL] error conditions are added.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- Semantics for typed memory objects are added to the DESCRIPTION.
- The *posix_typed_mem_open*( ) function is added to the SEE ALSO section.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).

Issue 7

Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment requirements.

The *munmap*( ) function is moved from the Memory Mapped Files option to the Base.

NAME

nan, nanf, nanl — return quiet NaN

SYNOPSIS

```
#include <math.h>

double nan(const char *tagp);
float nanf(const char *tagp);
long double nanl(const char *tagp);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The function call *nan*("*n-char-sequence*") shall be equivalent to:

```
strtod("NAN(n-char-sequence)", (char **) NULL);
```

The function call *nan*("") shall be equivalent to:

```
strtod("NAN()", (char **) NULL)
```

If *tagp* does not point to an *n*-**char** sequence or an empty string, the function call shall be equivalent to:

```
strtod("NAN", (char **) NULL)
```

Function calls to *nanf*( ) and *nanl*( ) are equivalent to the corresponding function calls to *strtof*( ) and *strtold*( ).

RETURN VALUE

These functions shall return a quiet NaN, if available, with content indicated through *tagp*.

If the implementation does not support quiet NaNs, these functions shall return zero.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

NAME

nanosleep — high resolution sleep

SYNOPSIS

CX
```
#include <time.h>

int nanosleep(const struct timespec *rqtp, struct timespec *rmtp);
```

DESCRIPTION

The *nanosleep*( ) function shall cause the current thread to be suspended from execution until either the time interval specified by the *rqtp* argument has elapsed or a signal is delivered to the calling thread, and its action is to invoke a signal-catching function or to terminate the process. The suspension time may be longer than requested because the argument value is rounded up to an integer multiple of the sleep resolution or because of the scheduling of other activity by the system. But, except for the case of being interrupted by a signal, the suspension time shall not be less than the time specified by *rqtp*, as measured by the system clock CLOCK_REALTIME.

The use of the *nanosleep*( ) function has no effect on the action or blockage of any signal.

RETURN VALUE

If the *nanosleep*( ) function returns because the requested time has elapsed, its return value shall be zero.

If the *nanosleep*( ) function returns because it has been interrupted by a signal, it shall return a value of −1 and set *errno* to indicate the interruption. If the *rmtp* argument is non-NULL, the **timespec** structure referenced by it is updated to contain the amount of time remaining in the interval (the requested time minus the time actually slept). The *rqtp* and *rmtp* arguments can point to the same object. If the *rmtp* argument is NULL, the remaining time is not returned.

If *nanosleep*( ) fails, it shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *nanosleep*( ) function shall fail if:

[EINTR] The *nanosleep*( ) function was interrupted by a signal.

[EINVAL] The *rqtp* argument specified a nanosecond value less than zero or greater than or equal to 1 000 million.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

It is common to suspend execution of a thread for an interval in order to poll the status of a non-interrupting function. A large number of actual needs can be met with a simple extension to *sleep*( ) that provides finer resolution.

In the POSIX.1-1990 standard and SVR4, it is possible to implement such a routine, but the frequency of wakeup is limited by the resolution of the *alarm*( ) and *sleep*( ) functions. In 4.3 BSD, it is possible to write such a routine using no static storage and reserving no system facilities. Although it is possible to write a function with similar functionality to *sleep*( ) using the remainder of the *timer_**( ) functions, such a function requires the use of signals and the reservation of some signal number. This volume of POSIX.1-2017 requires that *nanosleep*( ) be non-intrusive of the signals function.

The *nanosleep*( ) function shall return a value of 0 on success and −1 on failure or if interrupted.

This latter case is different from *sleep*( ). This was done because the remaining time is returned via an argument structure pointer, *rmtp*, instead of as the return value.

FUTURE DIRECTIONS

None.

SEE ALSO

clock_nanosleep( ), *sleep*( )

XBD **<time.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *nanosleep*( ) function is marked as part of the Timers option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/37 is applied, updating the SEE ALSO section to include the *clock_nanosleep*( ) function.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/63 is applied, correcting text in the RATIONALE section.

Issue 7

SD5-XBD-ERN-33 is applied.

The *nanosleep*( ) function is moved from the Timers option to the Base.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0231 [909] is applied.

NAME

nearbyint, nearbyintf, nearbyintl — floating-point rounding functions

SYNOPSIS

```
#include <math.h>

double nearbyint(double x);
float nearbyintf(float x);
long double nearbyintl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall round their argument to an integer value in floating-point format, using the current rounding direction and without raising the inexact floating-point exception.

RETURN VALUE

MX Upon successful completion, these functions shall return the rounded integer value. The result shall have the same sign as *x*.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, ±0 shall be returned.

If *x* is ±Inf, *x* shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The integral value returned by these functions need not be expressible as an **intmax_t**. The return value should be tested before assigning it to an integer type to avoid the undefined results of an integer overflow.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0402 [346,428] is applied.

NAME

newlocale — create or modify a locale object

SYNOPSIS

CX
```
#include <locale.h>

locale_t newlocale(int category_mask, const char *locale,
    locale_t base);
```

DESCRIPTION

The *newlocale*( ) function shall create a new locale object or modify an existing one. If the *base* argument is (**locale_t**)0, a new locale object shall be created. It is unspecified whether the locale object pointed to by *base* shall be modified, or freed and a new locale object created.

The *category_mask* argument specifies the locale categories to be set or modified. Values for *category_mask* shall be constructed by a bitwise-inclusive OR of the symbolic constants *LC_CTYPE_MASK*, *LC_NUMERIC_MASK*, *LC_TIME_MASK*, *LC_COLLATE_MASK*, *LC_MONETARY_MASK*, and *LC_MESSAGES_MASK*, or any of the implementation-defined mask values defined in **<locale.h>**.

For each category with the corresponding bit set in *category_mask* the data from the locale named by *locale* shall be used. In the case of modifying an existing locale object, the data from the locale named by *locale* shall replace the existing data within the locale object. If a completely new locale object is created, the data for all sections not requested by *category_mask* shall be taken from the default locale.

The following preset values of *locale* are defined for all settings of *category_mask*:

"POSIX" Specifies the minimal environment for C-language translation called the POSIX locale.

"C" Equivalent to `"POSIX"`.

"" Specifies an implementation-defined native environment. This corresponds to the value of the associated environment variables, *LC_** and *LANG*; see XBD Chapter 7 (on page 135) and Chapter 8 (on page 173).

If the *base* argument is not (**locale_t**)0 and the *newlocale*( ) function call succeeds, the contents of *base* are unspecified. Applications shall ensure that they stop using *base* as a locale object before calling *newlocale*( ). If the function call fails and the *base* argument is not (**locale_t**)0, the contents of *base* shall remain valid and unchanged.

The behavior is undefined if the *base* argument is the special locale object LC_GLOBAL_LOCALE, or is not a valid locale object handle and is not (**locale_t**)0.

RETURN VALUE

Upon successful completion, the *newlocale*( ) function shall return a handle which the caller may use on subsequent calls to *duplocale*( ), *freelocale*( ), and other functions taking a **locale_t** argument.

Upon failure, the *newlocale*( ) function shall return (**locale_t**)0 and set *errno* to indicate the error.

ERRORS

The *newlocale*( ) function shall fail if:

[ENOMEM] There is not enough memory available to create the locale object or load the locale data.

46305 [EINVAL] The *category_mask* contains a bit that does not correspond to a valid category.

46306 [ENOENT] For any of the categories in *category_mask*, the locale data is not available.

46307 The *newlocale*( ) function may fail if:

46308 [EINVAL] The *locale* argument is not a valid string pointer.

46309 **EXAMPLES**

46310 **Constructing a Locale Object from Different Locales**

46311 The following example shows the construction of a locale where the *LC_CTYPE* category data
46312 comes from a locale *loc1* and the *LC_TIME* category data from a locale *loc2*:

```
46313 #include <locale.h>
46314 ...
46315 locale_t loc, new_loc;
46316 /* Get the "loc1" data. */
46317 loc = newlocale (LC_CTYPE_MASK, "loc1", (locale_t)0);
46318 if (loc == (locale_t) 0)
46319     abort ();
46320 /* Get the "loc2" data. */
46321 new_loc = newlocale (LC_TIME_MASK, "loc2", loc);
46322 if (new_loc != (locale_t) 0)
46323     /* We don t abort if this fails. In this case this
46324        simply used to unchanged locale object. */
46325     loc = new_loc;
46326 ...
```

46327 **Freeing up a Locale Object**

46328 The following example shows a code fragment to free a locale object created by *newlocale*( ):

```
46329 #include <locale.h>
46330 ...
46331 /* Every locale object allocated with newlocale() should be
46332  * freed using freelocale():
46333  */
46334 locale_t loc;
46335 /* Get the locale. */
46336 loc = newlocale (LC_CTYPE_MASK | LC_TIME_MASK, "locname", (locale_t)0);
46337 /* ... Use the locale object ... */
46338 ...
46339 /* Free the locale object resources. */
46340 freelocale (loc);
```

APPLICATION USAGE

Handles for locale objects created by the *newlocale*( ) function should either be released by a corresponding call to *freelocale*( ), or be used as a base locale to another *newlocale*( ) call.

The special locale object LC_GLOBAL_LOCALE must not be passed for the *base* argument, even when returned by the *uselocale*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

None.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0232 [781] and XSH/TC2-2008/0233 [673] are applied.

NAME

nextafter, nextafterf, nextafterl, nexttoward, nexttowardf, nexttowardl — next representable floating-point number

SYNOPSIS

```
#include <math.h>

double nextafter(double x, double y);
float nextafterf(float x, float y);
long double nextafterl(long double x, long double y);
double nexttoward(double x, long double y);
float nexttowardf(float x, long double y);
long double nexttowardl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *nextafter*( ), *nextafterf*( ), and *nextafterl*( ) functions shall compute the next representable floating-point value following *x* in the direction of *y*. Thus, if *y* is less than *x*, *nextafter*( ) shall return the largest representable floating-point number less than *x*. The *nextafter*( ), *nextafterf*( ), and *nextafterl*( ) functions shall return *y* if *x* equals *y*.

The *nexttoward*( ), *nexttowardf*( ), and *nexttowardl*( ) functions shall be equivalent to the corresponding *nextafter*( ) functions, except that the second parameter shall have type **long double** and the functions shall return *y* converted to the type of the function if *x* equals *y*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the next representable floating-point value following *x* in the direction of *y*.

If *x*==*y*, *y* (of the type *x*) shall be returned.

If *x* is finite and the correct function value would overflow, a range error shall occur and ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (with the same sign as *x*) shall be returned as appropriate for the return type of the function.

MX If *x* or *y* is NaN, a NaN shall be returned.

MX If *x*!=*y* and the correct function value is subnormal, zero, or underflows, a range error shall occur, and

MXX the correct function value (if representable) or

MX 0.0 shall be returned.

ERRORS

These functions shall fail if:

Range Error — The correct value overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

MX | Range Error | The correct value is subnormal or underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

When **<tgmath.h>** is included, note that the return type of *nextafter*( ) depends on the generic typing deduced from both arguments, while the return type of *nexttoward*( ) depends only on the generic typing of the first argument.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

feclearexcept( ), *fetestexcept*( )

XBD Section 4.20 (on page 117), **<math.h>**, **<tgmath.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The *nextafter*( ) function is no longer marked as an extension.

The *nextafterf*( ), *nextafterl*( ), *nexttoward*( ), *nexttowardf*( ), and *nexttowardl*( ) functions are added for alignment with the ISO/IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0407 [68] and XSH/TC1-2008/0408 [357] are applied.

NAME

nftw — walk a file tree

SYNOPSIS

XSI
```
#include <ftw.h>

int nftw(const char *path, int (*fn)(const char *,
    const struct stat *, int, struct FTW *), int fd_limit, int flags);
```

DESCRIPTION

The *nftw*( ) function shall recursively descend the directory hierarchy rooted in *path*. The *nftw*( ) function has a similar effect to *ftw*( ) except that it takes an additional argument *flags*, which is a bitwise-inclusive OR of zero or more of the following flags:

FTW_CHDIR — If set, *nftw*( ) shall change the current working directory to each directory as it reports files in that directory. If clear, *nftw*( ) shall not change the current working directory.

FTW_DEPTH — If set, *nftw*( ) shall report all files in a directory before reporting the directory itself. If clear, *nftw*( ) shall report any directory before reporting the files in that directory.

FTW_MOUNT — If set, *nftw*( ) shall only report files in the same file system as *path*. If clear, *nftw*( ) shall report all files encountered during the walk.

FTW_PHYS — If set, *nftw*( ) shall perform a physical walk and shall not follow symbolic links.

If FTW_PHYS is clear and FTW_DEPTH is set, *nftw*( ) shall follow links instead of reporting them, but shall not report any directory that would be a descendant of itself. If FTW_PHYS is clear and FTW_DEPTH is clear, *nftw*( ) shall follow links instead of reporting them, but shall not report the contents of any directory that would be a descendant of itself.

At each file it encounters, *nftw*( ) shall call the user-supplied function *fn* with four arguments:

The first argument is the pathname of the object.

The second argument is a pointer to the **stat** buffer containing information on the object, filled in as if *fstatat*( ), *stat*( ), or *lstat*( ) had been called to retrieve the information.

The third argument is an integer giving additional information. Its value is one of the following:

FTW_D — The object is a directory.

FTW_DNR — The object is a directory that cannot be read. The *fn* function shall not be called for any of its descendants.

FTW_DP — The object is a directory and subdirectories have been visited. (This condition shall only occur if the FTW_DEPTH flag is included in *flags*.)

FTW_F — The object is a non-directory file.

FTW_NS — The *stat*( ) function failed on the object because of lack of appropriate permission. The **stat** buffer passed to *fn* is undefined. Failure of *stat*( ) for any other reason is considered an error and *nftw*( ) shall return –1.

FTW_SL — The object is a symbolic link. (This condition shall only occur if the FTW_PHYS flag is included in *flags*.)

46479 FTW_SLN The object is a symbolic link that does not name an existing file. (This
46480 condition shall only occur if the FTW_PHYS flag is not included in *flags*.)

46481 The fourth argument is a pointer to an **FTW** structure. The value of **base** is the offset of the
46482 object's filename in the pathname passed as the first argument to *fn*. The value of **level**
46483 indicates depth relative to the root of the walk, where the root level is 0.

46484 The results are unspecified if the application-supplied *fn* function does not preserve the current
46485 working directory.

46486 The argument *fd_limit* sets the maximum number of file descriptors that shall be used by *nftw*( )
46487 while traversing the file tree. At most one file descriptor shall be used for each directory level.

46488 The *nftw*( ) function need not be thread-safe.

46489 **RETURN VALUE**

46490 The *nftw*( ) function shall continue until the first of the following conditions occurs:

46491 An invocation of *fn* shall return a non-zero value, in which case *nftw*( ) shall return that
46492 value.

46493 The *nftw*( ) function detects an error other than [EACCES] (see FTW_DNR and FTW_NS
46494 above), in which case *nftw*( ) shall return –1 and set *errno* to indicate the error.

46495 The tree is exhausted, in which case *nftw*( ) shall return 0.

46496 **ERRORS**

46497 The *nftw*( ) function shall fail if:

46498 [EACCES] Search permission is denied for any component of *path* or read permission is
46499 denied for *path*, or *fn* returns –1 and does not reset *errno*.

46500 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
46501 argument.

46502 [ENAMETOOLONG]
46503 The length of a component of a pathname is longer than {NAME_MAX}.

46504 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

46505 [ENOTDIR] A component of *path* names an existing file that is neither a directory nor a
46506 symbolic link to a directory.

46507 [EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current
46508 programming environment for one or more files found in the file hierarchy.

46509 The *nftw*( ) function may fail if:

46510 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
46511 resolution of the *path* argument.

46512 [EMFILE] All file descriptors available to the process are currently open.

46513 [ENAMETOOLONG]
46514 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
46515 symbolic link produced an intermediate result with a length that exceeds
46516 {PATH_MAX}.

46517 [ENFILE] Too many files are currently open in the system.

46518 In addition, *errno* may be set if the function pointed to by *fn* causes *errno* to be set.

EXAMPLES

The following program traverses the directory tree under the path named in its first command-line argument, or under the current directory if no argument is supplied. It displays various information about each file. The second command-line argument can be used to specify characters that control the value assigned to the *flags* argument when calling *nftw*( ).

```
#include <ftw.h>
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <stdint.h>

static int
display_info(const char *fpath, const struct stat *sb,
    int tflag, struct FTW *ftwbuf)
{
    printf("%-3s %2d %7jd   %-40s %d %s\n",
        (tflag == FTW_D) ?   "d"   : (tflag == FTW_DNR) ? "dnr" :
        (tflag == FTW_DP) ?  "dp"  : (tflag == FTW_F) ?
            (S_ISBLK(sb->st_mode) ? "f b" :
             S_ISCHR(sb->st_mode) ? "f c" :
             S_ISFIFO(sb->st_mode) ? "f p" :
             S_ISREG(sb->st_mode) ? "f r" :
             S_ISSOCK(sb->st_mode) ? "f s" : "f ?") :
        (tflag == FTW_NS) ?  "ns"  : (tflag == FTW_SL) ?  "sl" :
        (tflag == FTW_SLN) ? "sln" : "?",
        ftwbuf->level, (intmax_t) sb->st_size,
        fpath, ftwbuf->base, fpath + ftwbuf->base);
    return 0;           /* To tell nftw() to continue */
}

int
main(int argc, char *argv[])
{
    int flags = 0;

    if (argc > 2 && strchr(argv[2], 'd') != NULL)
        flags |= FTW_DEPTH;
    if (argc > 2 && strchr(argv[2], 'p') != NULL)
        flags |= FTW_PHYS;

    if (nftw((argc < 2) ? "." : argv[1], display_info, 20, flags) == -1)
    {
        perror("nftw");
        exit(EXIT_FAILURE);
    }

    exit(EXIT_SUCCESS);
}
```

APPLICATION USAGE

The *nftw*( ) function may allocate dynamic storage during its operation. If *nftw*( ) is forcibly terminated, such as by *longjmp*( ) or *siglongjmp*( ) being executed by the function pointed to by *fn* or an interrupt routine, *nftw*( ) does not have a chance to free that storage, so it remains permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has

occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next invocation.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<ftw.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

In the DESCRIPTION, the definition of the *depth* argument is clarified.

Issue 6

The Open Group Base Resolution bwg97-003 is applied.

The ERRORS section is updated as follows:

The wording of the mandatory [ELOOP] error condition is updated.

A second optional [ELOOP] error condition is added.

The [EOVERFLOW] mandatory error condition is added.

Text is added to the DESCRIPTION to say that the *nftw( )* function need not be reentrant and that the results are unspecified if the application-supplied *fn* function does not preserve the current working directory.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/64 is applied, changing the argument *depth* to *fd_limit* throughout and changing ``to a maximum of 5 levels deep'' to ``using a maximum of 5 file descriptors'' in the EXAMPLES section.

Issue 7

Austin Group Interpretations 1003.1-2001 #143 and #156 are applied.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XBD-ERN-61 is applied.

APPLICATION USAGE is added and the EXAMPLES section is replaced with a new example.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0409 [403], XSH/TC1-2008/0410 [324], and XSH/TC1-2008/0411 [403] are applied.

NAME

nice — change the nice value of a process

SYNOPSIS

XSI
```
#include <unistd.h>

int nice(int incr);
```

DESCRIPTION

The *nice*( ) function shall add the value of *incr* to the nice value of the calling process. A nice value of a process is a non-negative number for which a more positive value shall result in less favorable scheduling.

A maximum nice value of 2*{NZERO}−1 and a minimum nice value of 0 shall be imposed by the system. Requests for values above or below these limits shall result in the nice value being set to the corresponding limit. Only a process with appropriate privileges can lower the nice value.

PS | TPS Calling the *nice*( ) function has no effect on the priority of processes or threads with policy SCHED_FIFO or SCHED_RR. The effect on processes or threads with other scheduling policies is implementation-defined.

The nice value set with *nice*( ) shall be applied to the process. If the process is multi-threaded, the nice value shall affect all system scope threads in the process.

As −1 is a permissible return value in a successful situation, an application wishing to check for error situations should set *errno* to 0, then call *nice*( ), and if it returns −1, check to see whether *errno* is non-zero.

RETURN VALUE

Upon successful completion, *nice*( ) shall return the new nice value −{NZERO}. Otherwise, −1 shall be returned, the nice value of the process shall not be changed, and *errno* shall be set to indicate the error.

ERRORS

The *nice*( ) function shall fail if:

[EPERM] The *incr* argument is negative and the calling process does not have appropriate privileges.

EXAMPLES

Changing the Nice Value

The following example adds the value of the *incr* argument, −20, to the nice value of the calling process.

```
#include <unistd.h>
...
int incr = -20;
int ret;

ret = nice(incr);
```

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A statement is added to the description indicating the effects of this function on the different scheduling policies and multi-threaded processes.

NAME

nl_langinfo, nl_langinfo_l ‡'language information

SYNOPSIS

```
#include <langinfo.h>

char *nl_langinfo(nl_item item);
char *nl_langinfo_l(nl_item item, locale_t locale);
```

DESCRIPTION

The *nl_langinfo*() and *nl_langinfo_l*() functions shall return a pointer to a string containing information relevant to the particular language or cultural area defined in the current locale, or in the locale represented by *locale*, respectively (see **<langinfo.h>**). The manifest constant names and values of *item* are defined in **<langinfo.h>**. For example:

```
nl_langinfo(ABDAY_1)
```

would return a pointer to the string "Dom" if the identified language was Portuguese, and "Sun" if the identified language was English.

```
nl_langinfo_l(ABDAY_1, loc)
```

would return a pointer to the string "Dom" if the identified language of the locale represented by *loc* was Portuguese, and "Sun" if the identified language of the locale represented by *loc* was English.

The *nl_langinfo*() function need not be thread-safe.

The behavior is undefined if the *locale* argument to *nl_langinfo_l*() is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

In a locale where *langinfo* data is not defined, these functions shall return a pointer to the corresponding string in the POSIX locale. In all locales, these functions shall return a pointer to an empty string if *item* contains an invalid setting.

The application shall not modify the string returned. The pointer returned by *nl_langinfo*() might be invalidated or the string content might be overwritten by a subsequent call to *nl_langinfo*() in any thread or to *nl_langinfo_l*() in the same thread or the initial thread, by subsequent calls to *setlocale*() with a category corresponding to the category of *item* (see **<langinfo.h>**) or the category LC_ALL, or by subsequent calls to *uselocale*() which change the category corresponding to the category of *item*. The pointer returned by *nl_langinfo_l*() might be invalidated or the string content might be overwritten by a subsequent call to *nl_langinfo_l*() in the same thread or to *nl_langinfo*() in any thread, or by subsequent calls to *freelocale*() or *newlocale*() which free or modify the locale object that was passed to *nl_langinfo_l*(). The returned pointer and the string content might also be invalidated if the calling thread is terminated.

ERRORS

No errors are defined.

EXAMPLES

Getting Date and Time Formatting Information

The following example returns a pointer to a string containing date and time formatting information, as defined in the *LC_TIME* category of the current locale.

```
#include <time.h>
#include <langinfo.h>
...
strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);
...
```

APPLICATION USAGE

The array pointed to by the return value should not be modified by the program, but may be modified by further calls to these functions.

RATIONALE

The possible interactions between internal data used by *nl_langinfo*( ) and *nl_langinfo_l*( ) are complicated by the fact that *nl_langinfo_l*( ) must be thread-safe but *nl_langinfo*( ) need not be. The various implementation choices are:

1. *nl_langinfo_l*( ) and *nl_langinfo*( ) use separate buffers, or at least one of them does not use an internal string buffer. In this case there are no interactions.
2. *nl_langinfo_l*( ) and *nl_langinfo*( ) share an internal per-thread buffer. There can be interactions, but only in the same thread.
3. *nl_langinfo_l*( ) uses an internal per-thread buffer, and *nl_langinfo*( ) uses (in all threads) the same buffer that *nl_langinfo_l*( ) uses in the initial thread. There can be interactions, but only when *nl_langinfo_l*( ) is called in the initial thread.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2.

Issue 5

The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

The *nl_langinfo*( ) function is moved from the XSI option to the Base.

The *nl_langinfo_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0412 [302], XSH/TC1-2008/0413 [75], XSH/TC1-2008/0414 [283], XSH/TC1-2008/0415 [75,402], XSH/TC1-2008/0416 [283], and XSH/TC1-2008/0417 [402] are applied.

46730 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0234 [656] is applied.

NAME

nrand48 ‡'generate uniformly distributed pseudo-random non-negative long integers

SYNOPSIS

XSI
```
#include <stdlib.h>

long nrand48(unsigned short xsubi[3]);
```

DESCRIPTION

Refer to *drand48( )*.

NAME

ntohl, ntohs — convert values between host and network byte order

SYNOPSIS

```
#include <arpa/inet.h>

uint32_t ntohl(uint32_t netlong);
uint16_t ntohs(uint16_t netshort);
```

DESCRIPTION

Refer to *htonl( )*.

NAME

open, openat ‡'open file

SYNOPSIS

OH
```
#include <sys/stat.h>
#include <fcntl.h>

int open(const char *path, int oflag, ...);
int openat(int fd, const char *path, int oflag, ...);
```

DESCRIPTION

The *open*( ) function shall establish the connection between a file and a file descriptor. It shall create an open file description that refers to a file and a file descriptor that refers to that open file description. The file descriptor is used by other I/O functions to refer to that file. The *path* argument points to a pathname naming the file.

The *open*( ) function shall return a file descriptor for the named file, allocated as described in Section 2.14 (on page 549). The open file description is new, and therefore the file descriptor shall not share it with any other process in the system. The FD_CLOEXEC file descriptor flag associated with the new file descriptor shall be cleared unless the O_CLOEXEC flag is set in *oflag*.

The file offset used to mark the current position within the file shall be set to the beginning of the file.

The file status flags and file access modes of the open file description shall be set according to the value of *oflag*.

Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in **<fcntl.h>**. Applications shall specify exactly one of the first five values (file access modes) below in the value of *oflag*:

O_EXEC — Open for execute only (non-directory files). The result is unspecified if this flag is applied to a directory.

O_RDONLY — Open for reading only.

O_RDWR — Open for reading and writing. The result is undefined if this flag is applied to a FIFO.

O_SEARCH — Open directory for search only. The result is unspecified if this flag is applied to a non-directory file.

O_WRONLY — Open for writing only.

Any combination of the following may be used:

O_APPEND — If set, the file offset shall be set to the end of the file prior to each write.

O_CLOEXEC — If set, the FD_CLOEXEC flag for the new file descriptor shall be set.

O_CREAT — If the file exists, this flag has no effect except as noted under O_EXCL below. Otherwise, if O_DIRECTORY is not set the file shall be created as a regular file; the user ID of the file shall be set to the effective user ID of the process; the group ID of the file shall be set to the group ID of the file's parent directory or to the effective group ID of the process; and the access permission bits (see **<sys/stat.h>**) of the file mode shall be set to the value of the argument following the *oflag* argument taken as type **mode_t** modified as follows: a bitwise AND is performed on the file-mode bits and the corresponding bits in the complement of the process' file mode

creation mask. Thus, all bits in the file mode whose corresponding bit in the file mode creation mask is set are cleared. When bits other than the file permission bits are set, the effect is unspecified. The argument following the *oflag* argument does not affect whether the file is open for reading, writing, or for both. Implementations shall provide a way to initialize the file's group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the file's group ID to the effective group ID of the calling process.

O_DIRECTORY — If *path* resolves to a non-directory file, fail and set *errno* to [ENOTDIR].

SIO O_DSYNC — Write I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion.

O_EXCL — If O_CREAT and O_EXCL are set, *open*( ) shall fail if the file exists. The check for the existence of the file and the creation of the file if it does not exist shall be atomic with respect to other threads executing *open*( ) naming the same filename in the same directory with O_EXCL and O_CREAT set. If O_EXCL and O_CREAT are set, and *path* names a symbolic link, *open*( ) shall fail and set *errno* to [EEXIST], regardless of the contents of the symbolic link. If O_EXCL is set and O_CREAT is not set, the result is undefined.

O_NOCTTY — If set and *path* identifies a terminal device, *open*( ) shall not cause the terminal device to become the controlling terminal for the process. If *path* does not identify a terminal device, O_NOCTTY shall be ignored.

O_NOFOLLOW — If *path* names a symbolic link, fail and set *errno* to [ELOOP].

O_NONBLOCK — When opening a FIFO with O_RDONLY or O_WRONLY set:

> If O_NONBLOCK is set, an *open*( ) for reading-only shall return without delay. An *open*( ) for writing-only shall return an error if no process currently has the file open for reading.
>
> If O_NONBLOCK is clear, an *open*( ) for reading-only shall block the calling thread until a thread opens the file for writing. An *open*( ) for writing-only shall block the calling thread until a thread opens the file for reading.

When opening a block special or character special file that supports non-blocking opens:

> If O_NONBLOCK is set, the *open*( ) function shall return without blocking for the device to be ready or available. Subsequent behavior of the device is device-specific.
>
> If O_NONBLOCK is clear, the *open*( ) function shall block the calling thread until the device is ready or available before returning.

Otherwise, the O_NONBLOCK flag shall not cause an error, but it is unspecified whether the file status flags will include the O_NONBLOCK flag.

SIO O_RSYNC — Read I/O operations on the file descriptor shall complete at the same level of integrity as specified by the O_DSYNC and O_SYNC flags. If both O_DSYNC and O_RSYNC are set in *oflag*, all I/O operations on the file

descriptor shall complete as defined by synchronized I/O data integrity completion. If both O_SYNC and O_RSYNC are set in flags, all I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.

XSI|SIO O_SYNC Write I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.

XSI The O_SYNC flag shall be supported for regular files, even if the Synchronized Input and Output option is not supported.

O_TRUNC If the file exists and is a regular file, and the file is successfully opened O_RDWR or O_WRONLY, its length shall be truncated to 0, and the mode and owner shall be unchanged. It shall have no effect on FIFO special files or terminal device files. Its effect on other file types is implementation-defined. The result of using O_TRUNC without either O_RDWR or O_WRONLY is undefined.

O_TTY_INIT If *path* identifies a terminal device other than a pseudo-terminal, the device is not already open in any process, and either O_TTY_INIT is set in *oflag* or O_TTY_INIT has the value zero, *open*( ) shall set any non-standard **termios** structure terminal parameters to a state that provides conforming behavior; see XBD Section 11.2 (on page 205). It is unspecified whether O_TTY_INIT has any effect if the device is already open in any process. If *path* identifies the slave side of a pseudo-terminal that is not already open in any process, *open*( ) shall set any non-standard **termios** structure terminal parameters to a state that provides conforming behavior, regardless of whether O_TTY_INIT is set. If *path* does not identify a terminal device, O_TTY_INIT shall be ignored.

If O_CREAT and O_DIRECTORY are set and the requested access mode is neither O_WRONLY nor O_RDWR, the result is unspecified.

If O_CREAT is set and the file did not previously exist, upon successful completion, *open*( ) shall mark for update the last data access, last data modification, and last file status change timestamps of the file and the last data modification and last file status change timestamps of the parent directory.

If O_TRUNC is set and the file did previously exist, upon successful completion, *open*( ) shall mark for update the last data modification and last file status change timestamps of the file.

SIO If both the O_SYNC and O_DSYNC flags are set, the effect is as if only the O_SYNC flag was set.

OB XSR If *path* refers to a STREAMS file, *oflag* may be constructed from O_NONBLOCK OR'ed with either O_RDONLY, O_WRONLY, or O_RDWR. Other flag values are not applicable to STREAMS devices and shall have no effect on them. The value O_NONBLOCK affects the operation of STREAMS drivers and certain functions applied to file descriptors associated with STREAMS files. For STREAMS drivers, the implementation of O_NONBLOCK is device-specific.

The application shall ensure that it specifies the O_TTY_INIT flag on the first open of a terminal device since system boot or since the device was closed by the process that last had it open. The

XSI application need not specify the O_TTY_INIT flag when opening pseudo-terminals. If *path* names the master side of a pseudo-terminal device, then it is unspecified whether *open*( ) locks the slave side so that it cannot be opened. Conforming applications shall call *unlockpt*( ) before opening the slave side.

The largest value that can be represented correctly in an object of type **off_t** shall be established as the offset maximum in the open file description.

The *openat*( ) function shall be equivalent to the *open*( ) function except in the case where *path* specifies a relative path. In this case the file to be opened is determined relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the access mode of the open file description associated with the file descriptor is not O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the access mode is O_SEARCH, the function shall not perform the check.

The *oflag* parameter and the optional fourth parameter correspond exactly to the parameters of *open*( ).

If *openat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working directory shall be used and the behavior shall be identical to a call to *open*( ).

RETURN VALUE

Upon successful completion, these functions shall open the file and return a non-negative integer representing the file descriptor. Otherwise, these functions shall return −1 and set *errno* to indicate the error. If −1 is returned, no files shall be created or modified.

ERRORS

These functions shall fail if:

[EACCES] Search permission is denied on a component of the path prefix, or the file exists and the permissions specified by *oflag* are denied, or the file does not exist and write permission is denied for the parent directory of the file to be created, or O_TRUNC is specified and write permission is denied.

[EEXIST] O_CREAT and O_EXCL are set, and the named file exists.

[EINTR] A signal was caught during *open*( ).

SIO [EINVAL] The implementation does not support synchronized I/O for this file.

OB XSR [EIO] The *path* argument names a STREAMS file and a hangup or error occurred during the *open*( ).

[EISDIR] The named file is a directory and *oflag* includes O_WRONLY or O_RDWR, or includes O_CREAT without O_DIRECTORY.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument, or O_NOFOLLOW was specified and the *path* argument names a symbolic link.

[EMFILE] All file descriptors available to the process are currently open.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENFILE] The maximum allowable number of files is currently open in the system.

[ENOENT] O_CREAT is not set and a component of *path* does not name an existing file, or O_CREAT is set and a component of the path prefix of *path* does not name an existing file, or *path* points to an empty string.

[ENOENT] or [ENOTDIR]
O_CREAT is set, and the *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters. If *path*

without the trailing <slash> characters would name an existing file, an [ENOENT] error shall not occur.

OB XSR [ENOSR] The *path* argument names a STREAMS-based file and the system is unable to allocate a STREAM.

[ENOSPC] The directory or file system that would contain the new file cannot be expanded, the file does not exist, and O_CREAT is specified.

[ENOTDIR] A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory; or O_CREAT and O_EXCL are not specified, the *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters, and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory; or O_DIRECTORY was specified and the *path* argument resolves to a non-directory file.

[ENXIO] O_NONBLOCK is set, the named file is a FIFO, O_WRONLY is set, and no process has the file open for reading.

[ENXIO] The named file is a character special or block special file, and the device associated with this special file does not exist.

[EOVERFLOW] The named file is a regular file and the size of the file cannot be represented correctly in an object of type **off_t**.

[EROFS] The named file resides on a read-only file system and either O_WRONLY, O_RDWR, O_CREAT (if the file does not exist), or O_TRUNC is set in the *oflag* argument.

The *openat( )* function shall fail if:

[EACCES] The access mode of the open file description associated with *fd* is not O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

[ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated with a non-directory file.

These functions may fail if:

XSI [EAGAIN] The *path* argument names the slave side of a pseudo-terminal device that is locked.

[EINVAL] The value of the *oflag* argument is not valid.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

OB XSR [ENOMEM] The *path* argument names a STREAMS file and the system is unable to allocate resources.

[EOPNOTSUPP] The *path* argument names a socket.

[ETXTBSY] The file is a pure procedure (shared text) file that is being executed and *oflag* is O_WRONLY or O_RDWR.

EXAMPLES

Opening a File for Writing by the Owner

The following example opens the file **/tmp/file**, either by creating it (if it does not already exist), or by truncating its length to 0 (if it does exist). In the former case, if the call creates a new file, the access permission bits in the file mode of the file are set to permit reading and writing by the owner, and to permit reading only by group members and others.

If the call to *open*( ) is successful, the file is opened for writing.

```
#include <fcntl.h>
...
int fd;
mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
char *pathname = "/tmp/file";
...
fd = open(pathname, O_WRONLY | O_CREAT | O_TRUNC, mode);
...
```

Opening a File Using an Existence Check

The following example uses the *open*( ) function to try to create the **LOCKFILE** file and open it for writing. Since the *open*( ) function specifies the O_EXCL flag, the call fails if the file already exists. In that case, the program assumes that someone else is updating the password file and exits.

```
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>

#define LOCKFILE "/etc/ptmp"
...
int pfd; /* Integer for file descriptor returned by open() call. */
...
if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
    S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
{
    fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
    exit(1);
}
...
```

47002 **Opening a File for Writing**

47003 The following example opens a file for writing, creating the file if it does not already exist. If the
47004 file does exist, the system truncates the file to zero bytes.

```
47005 #include <fcntl.h>
47006 #include <stdio.h>
47007 #include <stdlib.h>

47008 #define LOCKFILE "/etc/ptmp"
47009 ...
47010 int pfd;
47011 char pathname[PATH_MAX+1];
47012 ...
47013 if ((pfd = open(pathname, O_WRONLY | O_CREAT | O_TRUNC,
47014     S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
47015 {
47016     perror("Cannot open output file\n"); exit(1);
47017 }
47018 ...
```

47019 **APPLICATION USAGE**

47020 POSIX.1-2017 does not require that terminal parameters be automatically set to any state on first
47021 open, nor that they be reset after the last close. It is possible for a non-conforming application to
47022 leave a terminal device in a state where the next process to use that device finds it in a non-
47023 conforming state, but has no way of determining this. To ensure that the device is set to a
47024 conforming initial state, applications which perform a first open of a terminal (other than a
47025 pseudo-terminal) should do so using the O_TTY_INIT flag to set the parameters associated with
47026 the terminal to a conforming state.

47027 Except as specified in this volume of POSIX.1-2017, the flags allowed in *oflag* are not mutually-
47028 exclusive and any number of them may be used simultaneously. Not all combinations of flags
47029 make sense. For example, using O_SEARCH | O_CREAT will successfully open a pre-existing
47030 directory for searching, but if there is no existing file by that name, then it is unspecified whether
47031 a regular file will be created. Likewise, if a non-directory file descriptor is successfully returned,
47032 it is unspecified whether that descriptor will have execute permissions as if by O_EXEC (note
47033 that it is unspecified whether O_EXEC and O_SEARCH have the same value).

47034 **RATIONALE**

47035 Some implementations permit opening FIFOs with O_RDWR. Since FIFOs could be
47036 implemented in other ways, and since two file descriptors can be used to the same effect, this
47037 possibility is left as undefined.

47038 See *getgroups( )* about the group of a newly created file.

47039 The use of *open( )* to create a regular file is preferable to the use of *creat( )*, because the latter is
47040 redundant and included only for historical reasons.

47041 The use of the O_TRUNC flag on FIFOs and directories (pipes cannot be *open( )*-ed) must be
47042 permissible without unexpected side-effects (for example, *creat( )* on a FIFO must not remove
47043 data). Since terminal special files might have type-ahead data stored in the buffer, O_TRUNC
47044 should not affect their content, particularly if a program that normally opens a regular file
47045 should open the current controlling terminal instead. Other file types, particularly
47046 implementation-defined ones, are left implementation-defined.

47047 POSIX.1-2017 permits [EACCES] to be returned for conditions other than those explicitly listed.

The O_NOCTTY flag was added to allow applications to avoid unintentionally acquiring a controlling terminal as a side-effect of opening a terminal file. This volume of POSIX.1-2017 does not specify how a controlling terminal is acquired, but it allows an implementation to provide this on *open*( ) if the O_NOCTTY flag is not set and other conditions specified in XBD Chapter 11 (on page 199) are met.

In historical implementations the value of O_RDONLY is zero. Because of that, it is not possible to detect the presence of O_RDONLY and another option. Future implementations should encode O_RDONLY and O_WRONLY as bit flags so that:

```
O_RDONLY | O_WRONLY == O_RDWR
```

O_EXEC and O_SEARCH are specified as two of the five file access modes. Since O_EXEC does not apply to directories, and O_SEARCH only applies to directories, their values need not be distinct. Since O_RDONLY has historically had the value zero, implementations are not able to distinguish between O_SEARCH and O_SEARCH | O_RDONLY, and similarly for O_EXEC.

In general, the *open*( ) function follows the symbolic link if *path* names a symbolic link. However, the *open*( ) function, when called with O_CREAT and O_EXCL, is required to fail with [EEXIST] if *path* names an existing symbolic link, even if the symbolic link refers to a nonexistent file. This behavior is required so that privileged applications can create a new file in a known location without the possibility that a symbolic link might cause the file to be created in a different location.

For example, a privileged application that must create a file with a predictable name in a user-writable directory, such as the user's home directory, could be compromised if the user creates a symbolic link with that name that refers to a nonexistent file in a system directory. If the user can influence the contents of a file, the user could compromise the system by creating a new system configuration or spool file that would then be interpreted by the system. The test for a symbolic link which refers to a nonexisting file must be atomic with the creation of a new file.

In addition, the *open*( ) function refuses to open non-directories if the O_DIRECTORY flag is set. This avoids race conditions whereby a user might compromise the system by substituting a hard link to a sensitive file (e.g., a device or a FIFO) while a privileged application is running, where opening a file even for read access might have undesirable side-effects.

In addition, the *open*( ) function does not follow symbolic links if the O_NOFOLLOW flag is set. This avoids race conditions whereby a user might compromise the system by substituting a symbolic link to a sensitive file (e.g., a device) while a privileged application is running, where opening a file even for read access might have undesirable side-effects.

The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown*( ) to set the group ID after the file is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *openat*( ) function is to enable opening files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *open*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *openat*( ) function it can be guaranteed that the opened file is located relative to the desired directory. Some implementations use the *openat*( ) function for other purposes as well. In some cases, if the *oflag* parameter has the

47095 O_XATTR bit set, the returned file descriptor provides access to extended attributes. This
47096 functionality is not standardized here.

47097 **FUTURE DIRECTIONS**

47098 None.

47102 XBD Chapter 11 (on page 199), **<fcntl.h>**, **<sys/stat.h>**, **<sys/types.h>**

47103 **CHANGE HISTORY**

47104 First released in Issue 1. Derived from Issue 1 of the SVID.

47105 **Issue 5**

47106 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
47107 Threads Extension.

47108 Large File Summit extensions are added.

47109 **Issue 6**

47110 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

47111 The following new requirements on POSIX implementations derive from alignment with the
47112 Single UNIX Specification:

47113 The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
47114 required for conforming implementations of previous POSIX specifications, it was not
47115 required for UNIX applications.

47116 In the DESCRIPTION, O_CREAT is amended to state that the group ID of the file is set to
47117 the group ID of the file's parent directory or to the effective group ID of the process. This is
47118 a FIPS requirement.

47119 In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open
47120 file description. This change is to support large files.

47121 In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support
47122 large files.

47123 The [ENXIO] mandatory error condition is added.

47124 The [EINVAL], [ENAMETOOLONG], and [ETXTBSY] optional error conditions are added.

47125 The DESCRIPTION and ERRORS sections are updated so that items related to the optional XSI
47126 STREAMS Option Group are marked.

47127 The following changes were made to align with the IEEE P1003.1a draft standard:

47128 An explanation is added of the effect of the O_CREAT and O_EXCL flags when the path
47129 refers to a symbolic link.

47130 The [ELOOP] optional error condition is added.

47131 The normative text is updated to avoid use of the term ``must'' for application requirements.

47132 The DESCRIPTION of O_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.

Issue 7

Austin Group Interpretations 1003.1-2001 #113 and #143 are applied.

Austin Group Interpretation 1003.1-2001 #144 is applied, adding the O_TTY_INIT flag.

Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the FD_CLOEXEC flag atomically at *open*( ), and adding the F_DUPFD_CLOEXEC flag.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

This page is revised and the *openat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to the XSI STREAMS option is marked obsolescent.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0418 [292], XSH/TC1-2008/0419 [141], XSH/TC1-2008/0420 [461], XSH/TC1-2008/0421 [390], XSH/TC1-2008/0422 [146], XSH/TC1-2008/0423 [324], XSH/TC1-2008/0424 [292], XSH/TC1-2008/0425 [278], XSH/TC1-2008/0426 [278], XSH/TC1-2008/0427 [291], and XSH/TC1-2008/0428 [307] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0235 [873], XSH/TC2-2008/0236 [835], XSH/TC2-2008/0237 [847], XSH/TC2-2008/0238 [817], XSH/TC2-2008/0239 [835], XSH/TC2-2008/0240 [847], XSH/TC2-2008/0241 [822], XSH/TC2-2008/0242 [817], and XSH/TC2-2008/0243 [943] are applied.

47153 **NAME**

47154 open_memstream, open_wmemstream — open a dynamic memory buffer stream

47155 **SYNOPSIS**

47156 CX
```
#include <stdio.h>

FILE *open_memstream(char **bufp, size_t *sizep);

#include <wchar.h>

FILE *open_wmemstream(wchar_t **bufp, size_t *sizep);
```

47160 **DESCRIPTION**

47161 The *open_memstream*( ) and *open_wmemstream*( ) functions shall create an I/O stream associated
47162 with a dynamically allocated memory buffer. The stream shall be opened for writing and shall
47163 be seekable.

47164 The stream associated with a call to *open_memstream*( ) shall be byte-oriented.

47165 The stream associated with a call to *open_wmemstream*( ) shall be wide-oriented.

47166 The stream shall maintain a current position in the allocated buffer and a current buffer length.
47167 The position shall be initially set to zero (the start of the buffer). Each write to the stream shall
47168 start at the current position and move this position by the number of successfully written bytes
47169 for *open_memstream*( ) or the number of successfully written wide characters for
47170 *open_wmemstream*( ). The length shall be initially set to zero. If a write moves the position to a
47171 value larger than the current length, the current length shall be set to this position. In this case a
47172 null character for *open_memstream*( ) or a null wide character for *open_wmemstream*( ) shall be
47173 appended to the current buffer. For both functions the terminating null is not included in the
47174 calculation of the buffer length.

47175 After a successful *fflush*( ) or *fclose*( ), the pointer referenced by *bufp* shall contain the address of
47176 the buffer, and the variable pointed to by *sizep* shall contain the smaller of the current buffer
47177 length and the number of bytes for *open_memstream*( ), or the number of wide characters for
47178 *open_wmemstream*( ), between the beginning of the buffer and the current file position indicator.

47179 After a successful *fflush*( ) the pointer referenced by *bufp* and the variable referenced by *sizep*
47180 remain valid only until the next write operation on the stream or a call to *fclose*( ).

47181 After a successful *fclose*( ), the pointer referenced by *bufp* can be passed to *free*( ).

47182 **RETURN VALUE**

47183 Upon successful completion, these functions shall return a pointer to the object controlling the
47184 stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

47185 **ERRORS**

47186 These functions shall fail if:

47187 [EMFILE] {STREAM_MAX} streams are currently open in the calling process.

47188 These functions may fail if:

47189 [EINVAL] *bufp* or *sizep* are NULL.

47190 [EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

47191 [ENOMEM] Memory for the stream or the buffer could not be allocated.

EXAMPLES

```
#include <stdio.h>
#include <stdlib.h>

int
main (void)
{
    FILE *stream;
    char *buf;
    size_t len;
    off_t eob;

    stream = open_memstream (&buf, &len);
    if (stream == NULL)
        /* handle error */ ;
    fprintf (stream, "hello my world");
    fflush (stream);
    printf ("buf=%s, len=%zu\n", buf, len);
    eob = ftello(stream);
    fseeko (stream, 0, SEEK_SET);
    fprintf (stream, "good-bye");
    fseeko (stream, eob, SEEK_SET);
    fclose (stream);
    printf ("buf=%s, len=%zu\n", buf, len);
    free (buf);
    return 0;
}
```

This program produces the following output:

```
buf=hello my world, len=14
buf=good-bye world, len=14
```

APPLICATION USAGE

The buffer created by these functions should be freed by the application after closing the stream, by means of a call to *free*( ).

RATIONALE

These functions are similar to *fmemopen*( ) except that the memory is always allocated dynamically by the function, and the stream is opened only for output.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 7.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0244 [588] and XSH/TC2-2008/0245 [586] are applied.

47235 **NAME**

47236 openat — open file relative to directory file descriptor

47237 **SYNOPSIS**

47238 `#include <fcntl.h>`

47239 `int openat(int fd, const char *path, int oflag, ...);`

47240 **DESCRIPTION**

47241 Refer to *open( )*.

47242 **NAME**

47243 opendir — open directory associated with file descriptor

47244 **SYNOPSIS**

47245 `#include <dirent.h>`

47246 `DIR *opendir(const char *`*`dirname`*`);`

47247 **DESCRIPTION**

47248 Refer to *fdopendir( )*.

47249 **NAME**

47250 openlog ‡'open a connection to the logging facility

47251 **SYNOPSIS**

47252 XSI
```
#include <syslog.h>

void openlog(const char *ident, int logopt, int facility);
```
47253

47254 **DESCRIPTION**

47255 Refer to *closelog( )*.

47256 **NAME**

47257 optarg, opterr, optind, optopt ‡'options parsing variables

47258 **SYNOPSIS**

47259 ```
#include <unistd.h>
```

47260 ```
extern char *optarg;
```

47261 ```
extern int opterr, optind, optopt;
```

47262 **DESCRIPTION**

47263 Refer to *getopt*( ).

  
```

47264 **NAME**

47265 pathconf ‡ get configurable pathname variables

47266 **SYNOPSIS**

47267 `#include <unistd.h>`

47268 `long pathconf(const char *path, int name);`

47269 **DESCRIPTION**

47270 Refer to *fpathconf( )*.

47271 **NAME**

47272 pause — suspend the thread until a signal is received

47273 **SYNOPSIS**

47274 `#include <unistd.h>`

47275 `int pause(void);`

47276 **DESCRIPTION**

47277 The *pause*( ) function shall suspend the calling thread until delivery of a signal whose action is
47278 either to execute a signal-catching function or to terminate the process.

47279 If the action is to terminate the process, *pause*( ) shall not return.

47280 If the action is to execute a signal-catching function, *pause*( ) shall return after the signal-catching
47281 function returns.

47282 **RETURN VALUE**

47283 Since *pause*( ) suspends thread execution indefinitely unless interrupted by a signal, there is no
47284 successful completion return value. A value of –1 shall be returned and *errno* set to indicate the
47285 error.

47286 **ERRORS**

47287 The *pause*( ) function shall fail if:

47288 [EINTR] A signal is caught by the calling process and control is returned from the
47289 signal-catching function.

47290 **EXAMPLES**

47291 None.

47292 **APPLICATION USAGE**

47293 Many common uses of *pause*( ) have timing windows. The scenario involves checking a
47294 condition related to a signal and, if the signal has not occurred, calling *pause*( ). When the signal
47295 occurs between the check and the call to *pause*( ), the process often blocks indefinitely. The
47296 *sigprocmask*( ) and *sigsuspend*( ) functions can be used to avoid this type of problem.

47297 **RATIONALE**

47298 None.

47299 **FUTURE DIRECTIONS**

47300 None.

47301 **SEE ALSO**

47302 *sigsuspend*( )

47303 XBD **<unistd.h>**

47304 **CHANGE HISTORY**

47305 First released in Issue 1. Derived from Issue 1 of the SVID.

47306 **Issue 5**

47307 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

47308 **Issue 6**

47309 The APPLICATION USAGE section is added.

47310 **NAME**

47311 pclose — close a pipe stream to or from a process

47312 **SYNOPSIS**

47313 CX
```
#include <stdio.h>

int pclose(FILE *stream);
```

47314

47315 **DESCRIPTION**

47316 The *pclose*( ) function shall close a stream that was opened by *popen*( ), wait for the command to
47317 terminate, and return the termination status of the process that was running the command
47318 language interpreter. However, if a call caused the termination status to be unavailable to
47319 *pclose*( ), then *pclose*( ) shall return −1 with *errno* set to [ECHILD] to report this situation. This can
47320 happen if the application calls one of the following functions:

47321 *wait*( )

47322 *waitpid*( ) with a *pid* argument less than or equal to 0 or equal to the process ID of the
47323 command line interpreter

47324 Any other function not defined in this volume of POSIX.1-2017 that could do one of the
47325 above

47326 In any case, *pclose*( ) shall not return before the child process created by *popen*( ) has terminated.

47327 If the command language interpreter cannot be executed, the child termination status returned
47328 by *pclose*( ) shall be as if the command language interpreter terminated using *exit*(127) or
47329 *_exit*(127).

47330 The *pclose*( ) function shall not affect the termination status of any child of the calling process
47331 other than the one created by *popen*( ) for the associated stream.

47332 If the argument *stream* to *pclose*( ) is not a pointer to a stream created by *popen*( ), the result of
47333 *pclose*( ) is undefined.

47334 If a thread is canceled during execution of *pclose*( ), the behavior is undefined.

47335 **RETURN VALUE**

47336 Upon successful return, *pclose*( ) shall return the termination status of the command language
47337 interpreter. Otherwise, *pclose*( ) shall return −1 and set *errno* to indicate the error.

47338 **ERRORS**

47339 The *pclose*( ) function shall fail if:

47340 [ECHILD] The status of the child process could not be obtained, as described above.

47341 **EXAMPLES**

47342 None.

47343 **APPLICATION USAGE**

47344 None.

47345 **RATIONALE**

47346 There is a requirement that *pclose*( ) not return before the child process terminates. This is
47347 intended to disallow implementations that return [EINTR] if a signal is received while waiting.
47348 If *pclose*( ) returned before the child terminated, there would be no way for the application to
47349 discover which child used to be associated with the stream, and it could not do the cleanup
47350 itself.

47351 If the stream pointed to by *stream* was not created by *popen*( ), historical implementations of

pclose( ) return –1 without setting *errno*. To avoid requiring *pclose*( ) to set *errno* in this case, POSIX.1-2017 makes the behavior unspecified. An application should not use *pclose*( ) to close any stream that was not created by *popen*( ).

Some historical implementations of *pclose*( ) either block or ignore the signals SIGINT, SIGQUIT, and SIGHUP while waiting for the child process to terminate. Since this behavior is not described for the *pclose*( ) function in POSIX.1-2017, such implementations are not conforming. Also, some historical implementations return [EINTR] if a signal is received, even though the child process has not terminated. Such implementations are also considered non-conforming.

Consider, for example, an application that uses:

```
popen("command", "r")
```

to start *command*, which is part of the same application. The parent writes a prompt to its standard output (presumably the terminal) and then reads from the *popen*( )ed stream. The child reads the response from the user, does some transformation on the response (pathname expansion, perhaps) and writes the result to its standard output. The parent process reads the result from the pipe, does something with it, and prints another prompt. The cycle repeats. Assuming that both processes do appropriate buffer flushing, this would be expected to work.

To conform to POSIX.1-2017, *pclose*( ) must use *waitpid*( ), or some similar function, instead of *wait*( ).

The code sample below illustrates how the *pclose*( ) function might be implemented on a system conforming to POSIX.1-2017.

```
int pclose(FILE *stream)
{
    int stat;
    pid_t pid;

    pid = <pid for process created for stream by popen()>
    (void) fclose(stream);
    while (waitpid(pid, &stat, 0) == -1) {
        if (errno != EINTR){
            stat = -1;
            break;
        }
    }
    return(stat);
}
```

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 7

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0246 [632] is applied.

NAME

perror — write error messages to standard error

SYNOPSIS

```
#include <stdio.h>

void perror(const char *s);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *perror*( ) function shall map the error number accessed through the symbol *errno* to a language-dependent error message, which shall be written to the standard error stream as follows:

> First (if *s* is not a null pointer and the character pointed to by *s* is not the null byte), the string pointed to by *s* followed by a <colon> and a <space>.
>
> Then an error message string followed by a <newline>.

The contents of the error message strings shall be the same as those returned by *strerror*( ) with argument *errno*.

CX The *perror*( ) function shall mark for update the last data modification and last file status change timestamps of the file associated with the standard error stream at some time between its successful completion and *exit*( ), *abort*( ), or the completion of *fflush*( ) or *fclose*( ) on *stderr*.

The *perror*( ) function shall not change the orientation of the standard error stream.

On error, *perror*( ) shall set the error indicator for the stream to which *stderr* points, and shall set *errno* to indicate the error.

Since no value is returned, an application wishing to check for error situations should call *clearerr*(*stderr*) before calling *perror*( ), then if *ferror*(*stderr*) returns non-zero, the value of *errno* indicates which error occurred.

RETURN VALUE

The *perror*( ) function shall not return a value.

ERRORS

CX Refer to *fputc*( ).

EXAMPLES

Printing an Error Message for a Function

The following example replaces *bufptr* with a buffer that is the necessary size. If an error occurs, the *perror*( ) function prints a message and the program exits.

```
#include <stdio.h>
#include <stdlib.h>
...
char *bufptr;
size_t szbuf;
...
if ((bufptr = malloc(szbuf)) == NULL) {
    perror("malloc"); exit(2);
}
```

47438 . . .

47439 **APPLICATION USAGE**

47440 Application writers may prefer to use alternative interfaces instead of *perror*( ), such as
47441 *strerror_r*( ) in combination with *fprintf*( ).

47442 **RATIONALE**

47443 None.

47444 **FUTURE DIRECTIONS**

47445 None.

47446 **SEE ALSO**

47447 *fprintf*( ), *fputc*( ), *psiginfo*( ), *strerror*( )

47448 XBD **<stdio.h>**

47449 **CHANGE HISTORY**

47450 First released in Issue 1. Derived from Issue 1 of the SVID.

47451 **Issue 5**

47452 A paragraph is added to the DESCRIPTION indicating that *perror*( ) does not change the
47453 orientation of the standard error stream.

47454 **Issue 6**

47455 Extensions beyond the ISO C standard are marked.

47456 **Issue 7**

47457 SD5-XSH-ERN-95 is applied.

47458 Changes are made related to support for finegrained timestamps.

47459 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0429 [389,401], XSH/TC1-2008/0430
47460 [389], and XSH/TC1-2008/0431 [389,401] are applied.

47461 **NAME**

47462 pipe — create an interprocess channel

47463 **SYNOPSIS**

47464 ```
#include <unistd.h>
```

47465 ```
int pipe(int fildes[2]);
```

47466 **DESCRIPTION**

47467 The *pipe*( ) function shall create a pipe and place two file descriptors, one each into the
47468 arguments *fildes*[0] and *fildes*[1], that refer to the open file descriptions for the read and write
47469 ends of the pipe. The file descriptors shall be allocated as described in Section 2.14 (on page 549).
47470 The O_NONBLOCK and FD_CLOEXEC flags shall be clear on both file descriptors. (The *fcntl*( )
47471 function can be used to set both these flags.)

47472 Data can be written to the file descriptor *fildes*[1] and read from the file descriptor *fildes*[0]. A
47473 read on the file descriptor *fildes*[0] shall access data written to the file descriptor *fildes*[1] on a
47474 first-in-first-out basis. It is unspecified whether *fildes*[0] is also open for writing and whether
47475 *fildes*[1] is also open for reading.

47476 A process has the pipe open for reading (correspondingly writing) if it has a file descriptor open
47477 that refers to the read end, *fildes*[0] (write end, *fildes*[1]).

47478 The pipe's user ID shall be set to the effective user ID of the calling process.

47479 The pipe's group ID shall be set to the effective group ID of the calling process.

47480 Upon successful completion, *pipe*( ) shall mark for update the last data access, last data
47481 modification, and last file status change timestamps of the pipe.

47482 **RETURN VALUE**

47483 Upon successful completion, 0 shall be returned; otherwise, −1 shall be returned and *errno* set to
47484 indicate the error, no file descriptors shall be allocated and the contents of *fildes* shall be left
47485 unmodified.

47486 **ERRORS**

47487 The *pipe*( ) function shall fail if:

47488 [EMFILE] All, or all but one, of the file descriptors available to the process are currently
47489 open.

47490 [ENFILE] The number of simultaneously open files in the system would exceed a
47491 system-imposed limit.

47492 **EXAMPLES**

47493 **Using a Pipe to Pass Data Between a Parent Process and a Child Process**

47494 The following example demonstrates the use of a pipe to transfer data between a parent process
47495 and a child process. Error handling is excluded, but otherwise this code demonstrates good
47496 practice when using pipes: after the *fork*( ) the two processes close the unused ends of the pipe
47497 before they commence transferring data.

47498 ```
#include <stdlib.h>
```
47499 ```
#include <unistd.h>
```
47500 ```
...
```

47501 ```
int fildes[2];
```
47502 ```
const int BSIZE = 100;
```
47503 ```
char buf[BSIZE];
```

```
47504       ssize_t nbytes;
47505       int status;

47506       status = pipe(fildes);
47507       if (status == -1 ) {
47508           /* an error occurred */
47509           ...
47510       }

47511       switch (fork()) {
47512       case -1: /* Handle error */
47513           break;

47514       case 0:  /* Child - reads from pipe */
47515           close(fildes[1]);                       /* Write end is unused */
47516           nbytes = read(fildes[0], buf, BSIZE);   /* Get data from pipe */
47517           /* At this point, a further read would see end-of-file ... */
47518           close(fildes[0]);                       /* Finished with pipe */
47519           exit(EXIT_SUCCESS);

47520       default:  /* Parent - writes to pipe */
47521           close(fildes[0]);                       /* Read end is unused */
47522           write(fildes[1], "Hello world\n", 12);  /* Write data on pipe */
47523           close(fildes[1]);                       /* Child will see EOF */
47524           exit(EXIT_SUCCESS);
47525       }
```

APPLICATION USAGE

47526 47527 None.

RATIONALE

47528 47529 47530 The wording carefully avoids using the verb ``to open'' in order to avoid any implication of use of *open*( ); see also *write*( ).

FUTURE DIRECTIONS

47531 47532 None.

CHANGE HISTORY

47536 47537 First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

47538 47539 47540 The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

47541 47542 The DESCRIPTION is updated to indicate that certain dispositions of *fildes*[0] and *fildes*[1] are unspecified.

47543 47544 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/65 is applied, adding the example to the EXAMPLES section.

47545 **Issue 7**

47546 SD5-XSH-ERN-156 is applied, updating the DESCRIPTION to state the setting of the pipe's user
47547 ID and group ID.

47548 Changes are made related to support for finegrained timestamps.

47549 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0247 [835] and XSH/TC2-2008/0248
47550 [467,835] are applied.

47551 **NAME**

47552 poll ‡'input/output multiplexing

47553 **SYNOPSIS**

47554 `#include <poll.h>`

47555 `int poll(struct pollfd` *`fds`*`[], nfds_t` *`nfds`*`, int` *`timeout`*`);`

47556 **DESCRIPTION**

47557 The *poll*( ) function provides applications with a mechanism for multiplexing input/output over
47558 a set of file descriptors. For each member of the array pointed to by *fds*, *poll*( ) shall examine the
47559 given file descriptor for the event(s) specified in *events*. The number of **pollfd** structures in the
47560 *fds* array is specified by *nfds*. The *poll*( ) function shall identify those file descriptors on which an
47561 application can read or write data, or on which certain events have occurred.

47562 The *fds* argument specifies the file descriptors to be examined and the events of interest for each
47563 file descriptor. It is a pointer to an array with one member for each open file descriptor of
47564 interest. The array's members are **pollfd** structures within which *fd* specifies an open file
47565 descriptor and *events* and *revents* are bitmasks constructed by OR'ing a combination of the
47566 following event flags:

47567 POLLIN Data other than high-priority data may be read without blocking.

47568 OB XSR For STREAMS, this flag is set in *revents* even if the message is of zero length.
47569 This flag shall be equivalent to POLLRDNORM | POLLRDBAND.

47570 POLLRDNORM Normal data may be read without blocking.

47571 OB XSR For STREAMS, data on priority band 0 may be read without blocking. This
47572 flag is set in *revents* even if the message is of zero length.

47573 POLLRDBAND Priority data may be read without blocking.

47574 OB XSR For STREAMS, data on priority bands greater than 0 may be read without
47575 blocking. This flag is set in *revents* even if the message is of zero length.

47576 POLLPRI High-priority data may be read without blocking.

47577 OB XSR For STREAMS, this flag is set in *revents* even if the message is of zero length.

47578 POLLOUT Normal data may be written without blocking.

47579 OB XSR For STREAMS, data on priority band 0 may be written without blocking.

47580 POLLWRNORM Equivalent to POLLOUT.

47581 POLLWRBAND Priority data may be written.

47582 OB XSR For STREAMS, data on priority bands greater than 0 may be written without
47583 blocking. If any priority band has been written to on this STREAM, this event
47584 only examines bands that have been written to at least once.

47585 POLLERR An error has occurred on the device or stream. This flag is only valid in the
47586 *revents* bitmask; it shall be ignored in the *events* member.

47587 POLLHUP A device has been disconnected, or a pipe or FIFO has been closed by the last
47588 process that had it open for writing. Once set, the hangup state of a FIFO shall
47589 persist until some process opens the FIFO for writing or until all read-only file
47590 descriptors for the FIFO are closed. This event and POLLOUT are mutually-
47591 exclusive; a stream can never be writable if a hangup has occurred. However,
47592 this event and POLLIN, POLLRDNORM, POLLRDBAND, or POLLPRI are
47593 not mutually-exclusive. This flag is only valid in the *revents* bitmask; it shall be

47594 ignored in the *events* member.

47595 POLLNVAL The specified *fd* value is invalid. This flag is only valid in the *revents* member;
47596 it shall ignored in the *events* member.

47597 The significance and semantics of normal, priority, and high-priority data are file and device-
47598 specific.

47599 If the value of *fd* is less than 0, *events* shall be ignored, and *revents* shall be set to 0 in that entry on
47600 return from *poll*( ).

47601 In each **pollfd** structure, *poll*( ) shall clear the *revents* member, except that where the application
47602 requested a report on a condition by setting one of the bits of *events* listed above, *poll*( ) shall set
47603 the corresponding bit in *revents* if the requested condition is true. In addition, *poll*( ) shall set the
47604 POLLHUP, POLLERR, and POLLNVAL flag in *revents* if the condition is true, even if the
47605 application did not set the corresponding bit in *events*.

47606 If none of the defined events have occurred on any selected file descriptor, *poll*( ) shall wait at
47607 least *timeout* milliseconds for an event to occur on any of the selected file descriptors. If the value
47608 of *timeout* is 0, *poll*( ) shall return immediately. If the value of *timeout* is −1, *poll*( ) shall block until
47609 a requested event occurs or until the call is interrupted.

47610 Implementations may place limitations on the granularity of timeout intervals. If the requested
47611 timeout interval requires a finer granularity than the implementation supports, the actual
47612 timeout interval shall be rounded up to the next supported value.

47613 The *poll*( ) function shall not be affected by the O_NONBLOCK flag.

47614 The *poll*( ) function shall support regular files, terminal and pseudo-terminal devices, FIFOs,
47615 OB XSR pipes, sockets and STREAMS-based files. The behavior of *poll*( ) on elements of *fds* that refer to
47616 other types of file is unspecified.

47617 Regular files shall always poll TRUE for reading and writing.

47618 A file descriptor for a socket that is listening for connections shall indicate that it is ready for
47619 reading, once connections are available. A file descriptor for a socket that is connecting
47620 asynchronously shall indicate that it is ready for writing, once a connection has been established.

47621 Provided the application does not perform any action that results in unspecified or undefined
47622 behavior, the value of the *fd* and *events* members of each element of *fds* shall not be modified by
47623 *poll*( ).

47624 **RETURN VALUE**

47625 Upon successful completion, *poll*( ) shall return a non-negative value. A positive value indicates
47626 the total number of **pollfd** structures that have selected events (that is, those for which the
47627 *revents* member is non-zero). A value of 0 indicates that the call timed out and no file descriptors
47628 have been selected. Upon failure, *poll*( ) shall return −1 and set *errno* to indicate the error.

47629 **ERRORS**

47630 The *poll*( ) function shall fail if:

47631 [EAGAIN] The allocation of internal data structures failed but a subsequent request may
47632 succeed.

47633 [EINTR] A signal was caught during *poll*( ).

47634 OB XSR [EINVAL] The *nfds* argument is greater than {OPEN_MAX}, or one of the *fd* members
47635 refers to a STREAM or multiplexer that is linked (directly or indirectly)
47636 downstream from a multiplexer.

EXAMPLES

Checking for Events on a Stream

The following example opens a pair of STREAMS devices and then waits for either one to become writable. This example proceeds as follows:

1. Sets the *timeout* parameter to 500 milliseconds.
2. Opens the STREAMS devices **/dev/dev0** and **/dev/dev1**, and then polls them, specifying POLLOUT and POLLWRBAND as the events of interest.

   The STREAMS device names **/dev/dev0** and **/dev/dev1** are only examples of how STREAMS devices can be named; STREAMS naming conventions may vary among systems conforming to the POSIX.1-2017.
3. Uses the *ret* variable to determine whether an event has occurred on either of the two STREAMS. The *poll*( ) function is given 500 milliseconds to wait for an event to occur (if it has not occurred prior to the *poll*( ) call).
4. Checks the returned value of *ret*. If a positive value is returned, one of the following can be done:
   a. Priority data can be written to the open STREAM on priority bands greater than 0, because the POLLWRBAND event occurred on the open STREAM (*fds*[0] or *fds*[1]).
   b. Data can be written to the open STREAM on priority-band 0, because the POLLOUT event occurred on the open STREAM (*fds*[0] or *fds*[1]).
5. If the returned value is not a positive value, permission to write data to the open STREAM (on any priority band) is denied.
6. If the POLLHUP event occurs on the open STREAM (*fds*[0] or *fds*[1]), the device on the open STREAM has disconnected.

```
#include <stropts.h>
#include <poll.h>
...
struct pollfd fds[2];
int timeout_msecs = 500;
int ret;
    int i;

/* Open STREAMS device. */
fds[0].fd = open("/dev/dev0", ...);
fds[1].fd = open("/dev/dev1", ...);
fds[0].events = POLLOUT | POLLWRBAND;
fds[1].events = POLLOUT | POLLWRBAND;

ret = poll(fds, 2, timeout_msecs);

if (ret > 0) {
    /* An event on one of the fds has occurred. */
    for (i=0; i<2; i++) {
        if (fds[i].revents & POLLWRBAND) {
        /* Priority data may be written on device number i. */
...
        }
```

```
                if (fds[i].revents & POLLOUT) {
                /* Data may be written on device number i. */
        ...
                }
                if (fds[i].revents & POLLHUP) {
                /* A hangup has occurred on device number i. */
        ...
                }
            }
        }
```

APPLICATION USAGE

None.

RATIONALE

The POLLHUP event does not occur for FIFOs just because the FIFO is not open for writing. It only occurs when the FIFO is closed by the last writer and persists until some process opens the FIFO for writing or until all read-only file descriptors for the FIFO are closed.

FUTURE DIRECTIONS

None.

XBD **<poll.h>**, **<stropts.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The description of POLLWRBAND is updated.

Issue 6

Text referring to sockets is added to the DESCRIPTION.

Functionality relating to the XSI STREAMS Option Group is marked.

The Open Group Corrigendum U055/3 is applied, updating the DESCRIPTION of POLLWRBAND.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/66 is applied, correcting the spacing in the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #209 is applied, clarifying the POLLHUP event.

The *poll( )* function is moved from the XSI option to the Base.

Functionality relating to the XSI STREAMS option is marked obsolescent.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0249 [623] and XSH/TC2-2008/0250 [683] are applied.

47719 **NAME**

47720 popen — initiate pipe streams to or from a process

47721 **SYNOPSIS**

47722 CX
```
#include <stdio.h>

FILE *popen(const char *command, const char *mode);
```
47723

47724 **DESCRIPTION**

47725 The *popen*( ) function shall execute the command specified by the string *command*. It shall create
47726 a pipe between the calling program and the executed command, and shall return a pointer to a
47727 stream that can be used to either read from or write to the pipe.

47728 The environment of the executed command shall be as if a child process were created within the
47729 *popen*( ) call using the *fork*( ) function, and the child invoked the *sh* utility using the call:

47730 `execl(shell path, "sh", "-c", command, (char *)0);`

47731 where *shell path* is an unspecified pathname for the *sh* utility.

47732 The *popen*( ) function shall ensure that any streams from previous *popen*( ) calls that remain open
47733 in the parent process are closed in the new child process.

47734 The *mode* argument to *popen*( ) is a string that specifies I/O mode:

47735 1. If *mode* is *r*, when the child process is started, its file descriptor STDOUT_FILENO shall be
47736 the writable end of the pipe, and the file descriptor *fileno*(*stream*) in the calling process,
47737 where *stream* is the stream pointer returned by *popen*( ), shall be the readable end of the
47738 pipe.

47739 2. If *mode* is *w*, when the child process is started its file descriptor STDIN_FILENO shall be
47740 the readable end of the pipe, and the file descriptor *fileno*(*stream*) in the calling process,
47741 where *stream* is the stream pointer returned by *popen*( ), shall be the writable end of the
47742 pipe.

47743 3. If *mode* is any other value, the result is unspecified.

47744 After *popen*( ), both the parent and the child process shall be capable of executing independently
47745 before either terminates.

47746 Pipe streams are byte-oriented.

47747 **RETURN VALUE**

47748 Upon successful completion, *popen*( ) shall return a pointer to an open stream that can be used to
47749 read or write to the pipe. Otherwise, it shall return a null pointer and may set *errno* to indicate
47750 the error.

47751 **ERRORS**

47752 The *popen*( ) function shall fail if:

47753 [EMFILE] {STREAM_MAX} streams are currently open in the calling process.

47754 The *popen*( ) function may fail if:

47755 [EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

47756 [EINVAL] The *mode* argument is invalid.

47757 The *popen*( ) function may also set *errno* values as described by *fork*( ) or *pipe*( ).

EXAMPLES

Using popen( ) to Obtain a List of Files from the ls Utility

The following example demonstrates the use of *popen*( ) and *pclose*( ) to execute the command *ls** in order to obtain a list of files in the current directory:

```
#include <stdio.h>
...

FILE *fp;
int status;
char path[PATH_MAX];

fp = popen("ls *", "r");
if (fp == NULL)
    /* Handle error */;

while (fgets(path, PATH_MAX, fp) != NULL)
    printf("%s", path);

status = pclose(fp);
if (status == -1) {
    /* Error reported by pclose() */
    ...
} else {
    /* Use macros described under wait() to inspect `status' in order
       to determine success/failure of command executed by popen() */
    ...
}
```

APPLICATION USAGE

Since open files are shared, a mode *r* command can be used as an input filter and a mode *w* command as an output filter.

Buffered reading before opening an input filter may leave the standard input of that filter mispositioned. Similar problems with an output filter may be prevented by careful buffer flushing; for example, with *fflush*( ).

A stream opened by *popen*( ) should be closed by *pclose*( ).

The behavior of *popen*( ) is specified for values of *mode* of *r* and *w*. Other modes such as *rb* and *wb* might be supported by specific implementations, but these would not be portable features. Note that historical implementations of *popen*( ) only check to see if the first character of *mode* is *r*. Thus, a *mode* of *robert the robot* would be treated as *mode r*, and a *mode* of *anything else* would be treated as *mode w*.

If the application calls *waitpid*( ) or *waitid*( ) with a *pid* argument greater than 0, and it still has a stream that was called with *popen*( ) open, it must ensure that *pid* does not refer to the process started by *popen*( ).

To determine whether or not the environment specified in the Shell and Utilities volume of POSIX.1-2017 is present, use the function call:

```
sysconf(_SC_2_VERSION)
```

(See *sysconf*( )).

47800 **RATIONALE**

47801 The *popen*( ) function should not be used by programs that have set user (or group) ID privileges.
47802 The *fork*( ) and *exec* family of functions (except *execlp*( ) and *execvp*( )), should be used instead.
47803 This prevents any unforeseen manipulation of the environment of the user that could cause
47804 execution of commands not anticipated by the calling program.

47805 If the original and *popen*( )ed processes both intend to read or write or read and write a common
47806 file, and either will be using FILE-type C functions (*fread*( ), *fwrite*( ), and so on), the rules for
47807 sharing file handles must be observed (see Section 2.5.1, on page 497).

47808 **FUTURE DIRECTIONS**

47809 None.

47814 **CHANGE HISTORY**

47815 First released in Issue 1. Derived from Issue 1 of the SVID.

47816 **Issue 5**

47817 A statement is added to the DESCRIPTION indicating that pipe streams are byte-oriented.

47818 **Issue 6**

47819 The following new requirements on POSIX implementations derive from alignment with the
47820 Single UNIX Specification:

47821 The optional [EMFILE] error condition is added.

47822 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/67 is applied, adding the example to the
47823 EXAMPLES section.

47824 **Issue 7**

47825 Austin Group Interpretation 1003.1-2001 #029 is applied, clarifying the values for *mode* in the
47826 DESCRIPTION.

47827 SD5-XSH-ERN-149 is applied, changing the {STREAM_MAX} [EMFILE] error condition from a
47828 ``may fail'' to a ``shall fail''.

47829 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0432 [14] is applied.

47830 **NAME**

47831 posix_fadvise ‡’file advisory information (**ADVANCED REALTIME**)

47832 **SYNOPSIS**

47833 ADV
```
#include <fcntl.h>

int posix_fadvise(int fd, off_t offset, off_t len, int advice);
```

47834

47835 **DESCRIPTION**

47836 The *posix_fadvise*( ) function shall advise the implementation on the expected behavior of the
47837 application with respect to the data in the file associated with the open file descriptor, *fd*, starting
47838 at *offset* and continuing for *len* bytes. The specified range need not currently exist in the file. If *len*
47839 is zero, all data following *offset* is specified. The implementation may use this information to
47840 optimize handling of the specified data. The *posix_fadvise*( ) function shall have no effect on the
47841 semantics of other operations on the specified data, although it may affect the performance of
47842 other operations.

47843 The advice to be applied to the data is specified by the *advice* parameter and may be one of the
47844 following values:

47845 POSIX_FADV_NORMAL
47846 Specifies that the application has no advice to give on its behavior with respect to the
47847 specified data. It is the default characteristic if no advice is given for an open file.

47848 POSIX_FADV_SEQUENTIAL
47849 Specifies that the application expects to access the specified data sequentially from lower
47850 offsets to higher offsets.

47851 POSIX_FADV_RANDOM
47852 Specifies that the application expects to access the specified data in a random order.

47853 POSIX_FADV_WILLNEED
47854 Specifies that the application expects to access the specified data in the near future.

47855 POSIX_FADV_DONTNEED
47856 Specifies that the application expects that it will not access the specified data in the near
47857 future.

47858 POSIX_FADV_NOREUSE
47859 Specifies that the application expects to access the specified data once and then not reuse it
47860 thereafter.

47861 These values are defined in **<fcntl.h>**.

47862 **RETURN VALUE**

47863 Upon successful completion, *posix_fadvise*( ) shall return zero; otherwise, an error number shall
47864 be returned to indicate the error.

47865 **ERRORS**

47866 The *posix_fadvise*( ) function shall fail if:

47867 [EBADF] The *fd* argument is not a valid file descriptor.

47868 [EINVAL] The value of *advice* is invalid, or the value of *len* is less than zero.

47869 [ESPIPE] The *fd* argument is associated with a pipe or FIFO.

EXAMPLES

None.

APPLICATION USAGE

The *posix_fadvise*( ) function is part of the Advisory Information option and need not be provided on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<fcntl.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/68 is applied, changing the function prototype in the SYNOPSIS section. The previous prototype was not large file-aware, and the standard developers felt it acceptable to make this change before implementations of this function become widespread.

Issue 7

Austin Group Interpretation 1003.1-2001 #024 is applied, changing the definition of the [EINVAL] error.

47892 **NAME**

47893 posix_fallocate — file space control (**ADVANCED REALTIME**)

47894 **SYNOPSIS**

47895 ADV
```
#include <fcntl.h>

int posix_fallocate(int fd, off_t offset, off_t len);
```

47896

47897 **DESCRIPTION**

47898 The *posix_fallocate*( ) function shall ensure that any required storage for regular file data starting
47899 at *offset* and continuing for *len* bytes is allocated on the file system storage media. If
47900 *posix_fallocate*( ) returns successfully, subsequent writes to the specified file data shall not fail due
47901 to the lack of free space on the file system storage media.

47902 If the *offset+len* is beyond the current file size, then *posix_fallocate*( ) shall adjust the file size to
47903 *offset+len*. Otherwise, the file size shall not be changed.

47904 It is implementation-defined whether a previous *posix_fadvise*( ) call influences allocation
47905 strategy.

47906 Space allocated via *posix_fallocate*( ) shall be freed by a successful call to *creat*( ) or *open*( ) that
47907 truncates the size of the file. Space allocated via *posix_fallocate*( ) may be freed by a successful call
47908 to *ftruncate*( ) that reduces the file size to a size smaller than *offset+len*.

47909 **RETURN VALUE**

47910 Upon successful completion, *posix_fallocate*( ) shall return zero; otherwise, an error number shall
47911 be returned to indicate the error.

47912 **ERRORS**

47913 The *posix_fallocate*( ) function shall fail if:

47914 [EBADF] The *fd* argument is not a valid file descriptor.

47915 [EBADF] The *fd* argument references a file that was opened without write permission.

47916 [EFBIG] The value of *offset+len* is greater than the maximum file size.

47917 [EINTR] A signal was caught during execution.

47918 [EINVAL] The *len* argument is less than zero, or the *offset* argument is less than zero, or
47919 the underlying file system does not support this operation.

47920 [EIO] An I/O error occurred while reading from or writing to a file system.

47921 [ENODEV] The *fd* argument does not refer to a regular file.

47922 [ENOSPC] There is insufficient free space remaining on the file system storage media.

47923 [ESPIPE] The *fd* argument is associated with a pipe or FIFO.

47924 The *posix_fallocate*( ) function may fail if:

47925 [EINVAL] The *len* argument is zero.

47926 **EXAMPLES**

47927 None.

47928 **APPLICATION USAGE**

47929 The *posix_fallocate*( ) function is part of the Advisory Information option and need not be
47930 provided on all implementations.

47931 **RATIONALE**

47932 None.

47933 **FUTURE DIRECTIONS**

47934 None.

47935 **SEE ALSO**

47936 *creat*( ), *ftruncate*( ), *open*( ), *unlink*( )

47937 XBD **<fcntl.h>**

47938 **CHANGE HISTORY**

47939 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

47940 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

47941 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/69 is applied, changing the function
47942 prototype in the SYNOPSIS section. The previous prototype was not large file-aware, and the
47943 standard developers felt it acceptable to make this change before implementations of this
47944 function become widespread.

47945 **Issue 7**

47946 Austin Group Interpretations 1003.1-2001 #022, #024, and #162 are applied, changing the
47947 definition of the [EINVAL] error.

47948 **NAME**

47949 posix_madvise — memory advisory information and alignment control (**ADVANCED**
47950 **REALTIME**)

47951 **SYNOPSIS**

47952 ADV
```
#include <sys/mman.h>

int posix_madvise(void *addr, size_t len, int advice);
```
47953

47954 **DESCRIPTION**

47955 The *posix_madvise*( ) function shall advise the implementation on the expected behavior of the
47956 application with respect to the data in the memory starting at address *addr*, and continuing for
47957 *len* bytes. The implementation may use this information to optimize handling of the specified
47958 data. The *posix_madvise*( ) function shall have no effect on the semantics of access to memory in
47959 the specified range, although it may affect the performance of access.

47960 The implementation may require that *addr* be a multiple of the page size, which is the value
47961 returned by *sysconf*( ) when the name value _SC_PAGESIZE is used.

47962 The advice to be applied to the memory range is specified by the *advice* parameter and may be
47963 one of the following values:

47964 POSIX_MADV_NORMAL
47965 Specifies that the application has no advice to give on its behavior with respect to the
47966 specified range. It is the default characteristic if no advice is given for a range of memory.

47967 POSIX_MADV_SEQUENTIAL
47968 Specifies that the application expects to access the specified range sequentially from lower
47969 addresses to higher addresses.

47970 POSIX_MADV_RANDOM
47971 Specifies that the application expects to access the specified range in a random order.

47972 POSIX_MADV_WILLNEED
47973 Specifies that the application expects to access the specified range in the near future.

47974 POSIX_MADV_DONTNEED
47975 Specifies that the application expects that it will not access the specified range in the near
47976 future.

47977 These values are defined in the **<sys/mman.h>** header.

47978 **RETURN VALUE**

47979 Upon successful completion, *posix_madvise*( ) shall return zero; otherwise, an error number shall
47980 be returned to indicate the error.

47981 **ERRORS**

47982 The *posix_madvise*( ) function shall fail if:

47983 [EINVAL] The value of *advice* is invalid.

47984 [ENOMEM] Addresses in the range starting at *addr* and continuing for *len* bytes are partly
47985 or completely outside the range allowed for the address space of the calling
47986 process.

The *posix_madvise*( ) function may fail if:

[EINVAL] The value of *addr* is not a multiple of the value returned by *sysconf*( ) when the name value _SC_PAGESIZE is used.

[EINVAL] The value of *len* is zero.

EXAMPLES

None.

APPLICATION USAGE

The *posix_madvise*( ) function is part of the Advisory Information option and need not be provided on all implementations.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #102 is applied.

48006 **NAME**

48007 posix_mem_offset ‡' find offset and length of a mapped typed memory block (**ADVANCED**
48008 **REALTIME**)

48009 **SYNOPSIS**

48010 TYM
```
#include <sys/mman.h>

int posix_mem_offset(const void *restrict addr, size_t len,
    off_t *restrict off, size_t *restrict contig_len,
    int *restrict fildes);
```

48014 **DESCRIPTION**

48015 The *posix_mem_offset*( ) function shall return in the variable pointed to by *off* a value that
48016 identifies the offset (or location), within a memory object, of the memory block currently
48017 mapped at *addr*. The function shall return in the variable pointed to by *fildes*, the descriptor used
48018 (via *mmap*( )) to establish the mapping which contains *addr*. If that descriptor was closed since
48019 the mapping was established, the returned value of *fildes* shall be –1. The *len* argument specifies
48020 the length of the block of the memory object the user wishes the offset for; upon return, the
48021 value pointed to by *contig_len* shall equal either *len*, or the length of the largest contiguous block
48022 of the memory object that is currently mapped to the calling process starting at *addr*, whichever
48023 is smaller.

48024 If the memory object mapped at *addr* is a typed memory object, then if the *off* and *contig_len*
48025 values obtained by calling *posix_mem_offset*( ) are used in a call to *mmap*( ) with a file descriptor
48026 that refers to the same memory pool as *fildes* (either through the same port or through a different
48027 port), and that was opened with neither the POSIX_TYPED_MEM_ALLOCATE nor the
48028 POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, the typed memory area that is mapped shall
48029 be exactly the same area that was mapped at *addr* in the address space of the process that called
48030 *posix_mem_offset*( ).

48031 If the memory object specified by *fildes* is not a typed memory object, then the behavior of this
48032 function is implementation-defined.

48033 **RETURN VALUE**

48034 Upon successful completion, the *posix_mem_offset*( ) function shall return zero; otherwise, the
48035 corresponding error status value shall be returned.

48036 **ERRORS**

48037 The *posix_mem_offset*( ) function shall fail if:

48038 [EACCES] The process has not mapped a memory object supported by this function at
48039 the given address *addr*.

48040 This function shall not return an error code of [EINTR].

48041 **EXAMPLES**

48042 None.

48043 **APPLICATION USAGE**

48044 None.

48045 **RATIONALE**

48046 None.

48047 **FUTURE DIRECTIONS**

48048 None.

48049 **SEE ALSO**

48051 XBD **<sys/mman.h>**

48052 **CHANGE HISTORY**

48053 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

48054 **NAME**

48055 posix_memalign ‡'aligned memory allocation (**ADVANCED REALTIME**)

48056 **SYNOPSIS**

48057 ADV
```
#include <stdlib.h>

int posix_memalign(void **memptr, size_t alignment, size_t size);
```
48058

48059 **DESCRIPTION**

48060 The *posix_memalign*( ) function shall allocate *size* bytes aligned on a boundary specified by
48061 *alignment*, and shall return a pointer to the allocated memory in *memptr*. The value of *alignment*
48062 shall be a power of two multiple of *sizeof* (**void** *).

48063 Upon successful completion, the value pointed to by *memptr* shall be a multiple of *alignment*.

48064 If the size of the space requested is 0, the behavior is implementation-defined: either a null
48065 pointer shall be returned in *memptr*, or the behavior shall be as if the size were some non-zero
48066 value, except that the behavior is undefined if the the value returned in *memptr* is used to access
48067 an object.

48068 CX The *free*( ) function shall deallocate memory that has previously been allocated by
48069 *posix_memalign*( ).

48070 **RETURN VALUE**

48071 Upon successful completion, *posix_memalign*( ) shall return zero; otherwise, an error number
48072 shall be returned to indicate the error and the contents of *memptr* shall either be left unmodified
48073 or be set to a null pointer.

48074 If *size* is 0, either:

48075 *posix_memalign*( ) shall not attempt to allocate any space, in which case either an
48076 implementation-defined error number shall be returned, or zero shall be returned with a
48077 null pointer returned in *memptr*, or

48078 *posix_memalign*( ) shall attempt to allocate some space and, if the allocation succeeds, zero
48079 shall be returned and a pointer to the allocated space shall be returned in *memptr*. The
48080 application shall ensure that the pointer is not used to access an object.

48081 **ERRORS**

48082 The *posix_memalign*( ) function shall fail if:

48083 [EINVAL] The value of the alignment parameter is not a power of two multiple of
48084 *sizeof* (**void** *).

48085 [ENOMEM] There is insufficient memory available with the requested alignment.

48086 **EXAMPLES**

48087 The following example shows how applications can obtain consistent behavior on error by
48088 setting **memptr* to be a null pointer before calling *posix_memalign*( ).

```
48089 void *ptr = NULL;
48090 ...
48091 //do some work, which might goto error
48092 if (posix_memalign(&ptr, align, size))
48093     goto error;
48094 //do some more work, which might goto error
48095 ...
48096 error:
```

```
        free(ptr);
        //more cleanup;
```

APPLICATION USAGE

The *posix_memalign*( ) function is part of the Advisory Information option and need not be provided on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

Issue 7

Austin Group Interpretation 1003.1-2001 #058 is applied, clarifying the value of the *alignment* argument in the DESCRIPTION.

Austin Group Interpretation 1003.1-2001 #152 is applied, clarifying the behavior when the size of the space requested is 0.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0251 [526] and XSH/TC2-2008/0252 [520,526] are applied.

48119 **NAME**

48120 posix_openpt ‡'open a pseudo-terminal device

48121 **SYNOPSIS**

48122 XSI
```
#include <stdlib.h>
#include <fcntl.h>

int posix_openpt(int oflag);
```

48125 **DESCRIPTION**

48126 The *posix_openpt*( ) function shall establish a connection between a master device for a pseudo-
48127 terminal and a file descriptor. The file descriptor shall be allocated as described in Section 2.14
48128 (on page 549) and can be used by other I/O functions that refer to that pseudo-terminal.

48129 The file status flags and file access modes of the open file description shall be set according to
48130 the value of *oflag*.

48131 Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list, defined
48132 in **<fcntl.h>**:

48133 O_RDWR Open for reading and writing.

48134 O_NOCTTY If set *posix_openpt*( ) shall not cause the terminal device to become the
48135 controlling terminal for the process.

48136 The behavior of other values for the *oflag* argument is unspecified.

48137 **RETURN VALUE**

48138 Upon successful completion, the *posix_openpt*( ) function shall open a file descriptor for a master
48139 pseudo-terminal device and return a non-negative integer representing the file descriptor.
48140 Otherwise, –1 shall be returned and *errno* set to indicate the error.

48141 **ERRORS**

48142 The *posix_openpt*( ) function shall fail if:

48143 [EMFILE] All file descriptors available to the process are currently open.

48144 [ENFILE] The maximum allowable number of files is currently open in the system.

48145 The *posix_openpt*( ) function may fail if:

48146 [EINVAL] The value of *oflag* is not valid.

48147 [EAGAIN] Out of pseudo-terminal resources.

48148 OB XSR [ENOSR] Out of STREAMS resources.

48149 **EXAMPLES**

48150 **Opening a Pseudo-Terminal and Returning the Name of the Slave Device and a File**
48151 **Descriptor**

```
48152 #include <fcntl.h>
48153 #include <stdio.h>

48154 int masterfd, slavefd;
48155 char *slavedevice;

48156 masterfd = posix_openpt(O_RDWR|O_NOCTTY);

48157 if (masterfd == -1
48158     || grantpt (masterfd) == -1
```

```
48159           || unlockpt (masterfd) == -1
48160           || (slavedevice = ptsname (masterfd)) == NULL)
48161           return -1;
48162       printf("slave device is: %s\n", slavedevice);
48163       slavefd = open(slavedevice, O_RDWR|O_NOCTTY);
48164       if (slavefd < 0)
48165           return -1;
```

APPLICATION USAGE

This function is a method for portably obtaining a file descriptor of a master terminal device for a pseudo-terminal. The *grantpt*( ) and *ptsname*( ) functions can be used to manipulate mode and ownership permissions, and to obtain the name of the slave device, respectively.

RATIONALE

The standard developers considered the matter of adding a special device for cloning master pseudo-terminals: the **/dev/ptmx** device. However, consensus could not be reached, and it was felt that adding a new function would permit other implementations. The *posix_openpt*( ) function is designed to complement the *grantpt*( ), *ptsname*( ), and *unlockpt*( ) functions.

On implementations supporting the **/dev/ptmx** clone device, opening the master device of a pseudo-terminal is simply:

```
mfdp = open("/dev/ptmx", oflag );
if (mfdp < 0)
    return -1;
```

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6.

Issue 7

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-51 is applied, correcting an error in the EXAMPLES section.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0253 [835] and XSH/TC2-2008/0254 [835] are applied.

NAME

posix_spawn, posix_spawnp — spawn a process (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <spawn.h>

int posix_spawn(pid_t *restrict pid, const char *restrict path,
    const posix_spawn_file_actions_t *file_actions,
    const posix_spawnattr_t *restrict attrp,
    char *const argv[restrict], char *const envp[restrict]);
int posix_spawnp(pid_t *restrict pid, const char *restrict file,
    const posix_spawn_file_actions_t *file_actions,
    const posix_spawnattr_t *restrict attrp,
    char *const argv[restrict], char *const envp[restrict]);
```

DESCRIPTION

The *posix_spawn*( ) and *posix_spawnp*( ) functions shall create a new process (child process) from the specified process image. The new process image shall be constructed from a regular executable file called the new process image file.

When a C program is executed as the result of this call, it shall be entered as a C-language function call as follows:

```
int main(int argc, char *argv[]);
```

where *argc* is the argument count and *argv* is an array of character pointers to the arguments themselves. In addition, the following variable:

```
extern char **environ;
```

shall be initialized as a pointer to an array of character pointers to the environment strings.

The argument *argv* is an array of character pointers to null-terminated strings. The last member of this array shall be a null pointer and is not counted in *argc*. These strings constitute the argument list available to the new process image. The value in *argv*[0] should point to a filename string that is associated with the process image being started by the *posix_spawn*( ) or *posix_spawnp*( ) function.

The argument *envp* is an array of character pointers to null-terminated strings. These strings constitute the environment for the new process image. The environment array is terminated by a null pointer.

The number of bytes available for the combined argument and environment lists of the child process is {ARG_MAX}. The implementation shall specify in the system documentation (see XBD Chapter 2, on page 15) whether any list overhead, such as length words, null terminators, pointers, or alignment bytes, is included in this total.

The *path* argument to *posix_spawn*( ) is a pathname that identifies the new process image file to execute.

The *file* parameter to *posix_spawnp*( ) shall be used to construct a pathname that identifies the new process image file. If the *file* parameter contains a <slash> character, the *file* parameter shall be used as the pathname for the new process image file. Otherwise, the path prefix for this file shall be obtained by a search of the directories passed as the environment variable *PATH* (see XBD Chapter 8, on page 173). If this environment variable is not defined, the results of the search are implementation-defined.

If *file_actions* is a null pointer, then file descriptors open in the calling process shall remain open

in the child process, except for those whose close-on-*exec* flag FD_CLOEXEC is set (see *fcntl*( )). For those file descriptors that remain open, the child process shall not inherit any file locks, but all remaining attributes of the corresponding open file descriptions (see *fcntl*( )), shall remain unchanged.

If *file_actions* is not NULL, then the file descriptors open in the child process shall be those open in the calling process as modified by the spawn file actions object pointed to by *file_actions* and the FD_CLOEXEC flag of each remaining open file descriptor after the spawn file actions have been processed. The effective order of processing the spawn file actions shall be:

1. The set of open file descriptors for the child process shall initially be the same set as is open for the calling process. The child process shall not inherit any file locks, but all remaining attributes of the corresponding open file descriptions (see *fcntl*( )), shall remain unchanged.
2. The signal mask, signal default actions, and the effective user and group IDs for the child process shall be changed as specified in the attributes object referenced by *attrp*.
3. The file actions specified by the spawn file actions object shall be performed in the order in which they were added to the spawn file actions object.
4. Any file descriptor that has its FD_CLOEXEC flag set (see *fcntl*( )) shall be closed.

If file descriptor 0, 1, or 2 would otherwise be closed in the new process image created by *posix_spawn*( ) or *posix_spawnp*( ), implementations may open an unspecified file for the file descriptor in the new process image. If a standard utility or a conforming application is executed with file descriptor 0 not open for reading or with file descriptor 1 or 2 not open for writing, the environment in which the utility or application is executed shall be deemed non-conforming, and consequently the utility or application might not behave as described in this standard.

The **posix_spawnattr_t** spawn attributes object type is defined in **<spawn.h>**. It shall contain at least the attributes defined below.

If the POSIX_SPAWN_SETPGROUP flag is set in the *spawn-flags* attribute of the object referenced by *attrp*, and the *spawn-pgroup* attribute of the same object is non-zero, then the child's process group shall be as specified in the *spawn-pgroup* attribute of the object referenced by *attrp*.

As a special case, if the POSIX_SPAWN_SETPGROUP flag is set in the *spawn-flags* attribute of the object referenced by *attrp*, and the *spawn-pgroup* attribute of the same object is set to zero, then the child shall be in a new process group with a process group ID equal to its process ID.

If the POSIX_SPAWN_SETPGROUP flag is not set in the *spawn-flags* attribute of the object referenced by *attrp*, the new child process shall inherit the parent's process group.

PS If the POSIX_SPAWN_SETSCHEDPARAM flag is set in the *spawn-flags* attribute of the object referenced by *attrp*, but POSIX_SPAWN_SETSCHEDULER is not set, the new process image shall initially have the scheduling policy of the calling process with the scheduling parameters specified in the *spawn-schedparam* attribute of the object referenced by *attrp*.

If the POSIX_SPAWN_SETSCHEDULER flag is set in the *spawn-flags* attribute of the object referenced by *attrp* (regardless of the setting of the POSIX_SPAWN_SETSCHEDPARAM flag), the new process image shall initially have the scheduling policy specified in the *spawn-schedpolicy* attribute of the object referenced by *attrp* and the scheduling parameters specified in the *spawn-schedparam* attribute of the same object.

The POSIX_SPAWN_RESETIDS flag in the *spawn-flags* attribute of the object referenced by *attrp* governs the effective user ID of the child process. If this flag is not set, the child process shall inherit the effective user ID of the parent process. If this flag is set, the effective user ID of the

child process shall be reset to the parent's real user ID. In either case, if the set-user-ID mode bit of the new process image file is set, the effective user ID of the child process shall become that file's owner ID before the new process image begins execution.

The POSIX_SPAWN_RESETIDS flag in the *spawn-flags* attribute of the object referenced by *attrp* also governs the effective group ID of the child process. If this flag is not set, the child process shall inherit the effective group ID of the parent process. If this flag is set, the effective group ID of the child process shall be reset to the parent's real group ID. In either case, if the set-group-ID mode bit of the new process image file is set, the effective group ID of the child process shall become that file's group ID before the new process image begins execution.

If the POSIX_SPAWN_SETSIGMASK flag is set in the *spawn-flags* attribute of the object referenced by *attrp*, the child process shall initially have the signal mask specified in the *spawn-sigmask* attribute of the object referenced by *attrp*.

If the POSIX_SPAWN_SETSIGDEF flag is set in the *spawn-flags* attribute of the object referenced by *attrp*, the signals specified in the *spawn-sigdefault* attribute of the same object shall be set to their default actions in the child process. Signals set to the default action in the parent process shall be set to the default action in the child process.

Signals set to be caught by the calling process shall be set to the default action in the child process.

Except for SIGCHLD, signals set to be ignored by the calling process image shall be set to be ignored by the child process, unless otherwise specified by the POSIX_SPAWN_SETSIGDEF flag being set in the *spawn-flags* attribute of the object referenced by *attrp* and the signals being indicated in the *spawn-sigdefault* attribute of the object referenced by *attrp*.

If the SIGCHLD signal is set to be ignored by the calling process, it is unspecified whether the SIGCHLD signal is set to be ignored or to the default action in the child process, unless otherwise specified by the POSIX_SPAWN_SETSIGDEF flag being set in the *spawn_flags* attribute of the object referenced by *attrp* and the SIGCHLD signal being indicated in the *spawn_sigdefault* attribute of the object referenced by *attrp*.

If the value of the *attrp* pointer is NULL, then the default values are used.

All process attributes, other than those influenced by the attributes set in the object referenced by *attrp* as specified above or by the file descriptor manipulations specified in *file_actions*, shall appear in the new process image as though *fork*( ) had been called to create a child process and then a member of the *exec* family of functions had been called by the child process to execute the new process image.

It is implementation-defined whether the fork handlers are run when *posix_spawn*( ) or *posix_spawnp*( ) is called.

RETURN VALUE

Upon successful completion, *posix_spawn*( ) and *posix_spawnp*( ) shall return the process ID of the child process to the parent process, in the variable pointed to by a non-NULL *pid* argument, and shall return zero as the function return value. Otherwise, no child process shall be created, the value stored into the variable pointed to by a non-NULL *pid* is unspecified, and an error number shall be returned as the function return value to indicate the error. If the *pid* argument is a null pointer, the process ID of the child is not returned to the caller.

ERRORS

These functions may fail if:

[EINVAL] The value specified by *file_actions* or *attrp* is invalid.

If this error occurs after the calling process successfully returns from the *posix_spawn*( ) or *posix_spawnp*( ) function, the child process may exit with exit status 127.

If *posix_spawn*( ) or *posix_spawnp*( ) fail for any of the reasons that would cause *fork*( ) or one of the *exec* family of functions to fail, an error value shall be returned as described by *fork*( ) and *exec*, respectively (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If POSIX_SPAWN_SETPGROUP is set in the *spawn-flags* attribute of the object referenced by *attrp*, and *posix_spawn*( ) or *posix_spawnp*( ) fails while changing the child's process group, an error value shall be returned as described by *setpgid*( ) (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

PS If POSIX_SPAWN_SETSCHEDPARAM is set and POSIX_SPAWN_SETSCHEDULER is not set in the *spawn-flags* attribute of the object referenced by *attrp*, then if *posix_spawn*( ) or *posix_spawnp*( ) fails for any of the reasons that would cause *sched_setparam*( ) to fail, an error value shall be returned as described by *sched_setparam*( ) (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If POSIX_SPAWN_SETSCHEDULER is set in the *spawn-flags* attribute of the object referenced by *attrp*, and if *posix_spawn*( ) or *posix_spawnp*( ) fails for any of the reasons that would cause *sched_setscheduler*( ) to fail, an error value shall be returned as described by *sched_setscheduler*( ) (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If the *file_actions* argument is not NULL, and specifies any *close*, *dup2*, or *open* actions to be performed, and if *posix_spawn*( ) or *posix_spawnp*( ) fails for any of the reasons that would cause *close*( ), *dup2*( ), or *open*( ) to fail, an error value shall be returned as described by *close*( ), *dup2*( ), and *open*( ), respectively (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127). An open file action may, by itself, result in any of the errors described by *close*( ) or *dup2*( ), in addition to those described by *open*( ).

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

See also the APPLICATION USAGE section for *exec*.

RATIONALE

The *posix_spawn*( ) function and its close relation *posix_spawnp*( ) have been introduced to overcome the following perceived difficulties with *fork*( ): the *fork*( ) function is difficult or impossible to implement without swapping or dynamic address translation.

Swapping is generally too slow for a realtime environment.

Dynamic address translation is not available everywhere that POSIX might be useful.

Processes are too useful to simply option out of POSIX whenever it must run without address translation or other MMU services.

Thus, POSIX needs process creation and file execution primitives that can be efficiently implemented without address translation or other MMU services.

The *posix_spawn*( ) function is implementable as a library routine, but both *posix_spawn*( ) and *posix_spawnp*( ) are designed as kernel operations. Also, although they may be an efficient

replacement for many *fork*( )/*exec* pairs, their goal is to provide useful process creation primitives for systems that have difficulty with *fork*( ), not to provide drop-in replacements for *fork*( )/*exec*.

This view of the role of *posix_spawn*( ) and *posix_spawnp*( ) influenced the design of their API. It does not attempt to provide the full functionality of *fork*( )/*exec* in which arbitrary user-specified operations of any sort are permitted between the creation of the child process and the execution of the new process image; any attempt to reach that level would need to provide a programming language as parameters. Instead, *posix_spawn*( ) and *posix_spawnp*( ) are process creation primitives like the *Start_Process* and *Start_Process_Search* Ada language bindings package *POSIX_Process_Primitives* and also like those in many operating systems that are not UNIX systems, but with some POSIX-specific additions.

To achieve its coverage goals, *posix_spawn*( ) and *posix_spawnp*( ) have control of six types of inheritance: file descriptors, process group ID, user and group ID, signal mask, scheduling, and whether each signal ignored in the parent will remain ignored in the child, or be reset to its default action in the child.

Control of file descriptors is required to allow an independently written child process image to access data streams opened by and even generated or read by the parent process without being specifically coded to know which parent files and file descriptors are to be used. Control of the process group ID is required to control how the job control of the child process relates to that of the parent.

Control of the signal mask and signal defaulting is sufficient to support the implementation of *system*( ). Although support for *system*( ) is not explicitly one of the goals for *posix_spawn*( ) and *posix_spawnp*( ), it is covered under the ``at least 50%'' coverage goal.

The intention is that the normal file descriptor inheritance across *fork*( ), the subsequent effect of the specified spawn file actions, and the normal file descriptor inheritance across one of the *exec* family of functions should fully specify open file inheritance. The implementation need make no decisions regarding the set of open file descriptors when the child process image begins execution, those decisions having already been made by the caller and expressed as the set of open file descriptors and their FD_CLOEXEC flags at the time of the call and the spawn file actions object specified in the call. We have been assured that in cases where the POSIX *Start_Process* Ada primitives have been implemented in a library, this method of controlling file descriptor inheritance may be implemented very easily.

We can identify several problems with *posix_spawn*( ) and *posix_spawnp*( ), but there does not appear to be a solution that introduces fewer problems. Environment modification for child process attributes not specifiable via the *attrp* or *file_actions* arguments must be done in the parent process, and since the parent generally wants to save its context, it is more costly than similar functionality with *fork*( )/*exec*. It is also complicated to modify the environment of a multi-threaded process temporarily, since all threads must agree when it is safe for the environment to be changed. However, this cost is only borne by those invocations of *posix_spawn*( ) and *posix_spawnp*( ) that use the additional functionality. Since extensive modifications are not the usual case, and are particularly unlikely in time-critical code, keeping much of the environment control out of *posix_spawn*( ) and *posix_spawnp*( ) is appropriate design.

The *posix_spawn*( ) and *posix_spawnp*( ) functions do not have all the power of *fork*( )/*exec*. This is to be expected. The *fork*( ) function is a wonderfully powerful operation. We do not expect to duplicate its functionality in a simple, fast function with no special hardware requirements. It is worth noting that *posix_spawn*( ) and *posix_spawnp*( ) are very similar to the process creation operations on many operating systems that are not UNIX systems.

48416 **Requirements**

48417 The requirements for *posix_spawn*( ) and *posix_spawnp*( ) are:

48418 They must be implementable without an MMU or unusual hardware.

48419 They must be compatible with existing POSIX standards.

48420 Additional goals are:

48421 They should be efficiently implementable.

48422 They should be able to replace at least 50% of typical executions of *fork*( ).

48423 A system with *posix_spawn*( ) and *posix_spawnp*( ) and without *fork*( ) should be useful, at
48424 least for realtime applications.

48425 A system with *fork*( ) and the *exec* family should be able to implement *posix_spawn*( ) and
48426 *posix_spawnp*( ) as library routines.

48427 **Two-Syntax**

48428 POSIX *exec* has several calling sequences with approximately the same functionality. These
48429 appear to be required for compatibility with existing practice. Since the existing practice for the
48430 *posix_spawn**( ) functions is otherwise substantially unlike POSIX, we feel that simplicity
48431 outweighs compatibility. There are, therefore, only two names for the *posix_spawn**( ) functions.

48432 The parameter list does not differ between *posix_spawn*( ) and *posix_spawnp*( ); *posix_spawnp*( )
48433 interprets the second parameter more elaborately than *posix_spawn*( ).

48434 **Compatibility with POSIX.5 (Ada)**

48435 The *Start_Process* and *Start_Process_Search* procedures from the *POSIX_Process_Primitives*
48436 package from the Ada language binding to POSIX.1 encapsulate *fork*( ) and *exec* functionality in a
48437 manner similar to that of *posix_spawn*( ) and *posix_spawnp*( ). Originally, in keeping with our
48438 simplicity goal, the standard developers had limited the capabilities of *posix_spawn*( ) and
48439 *posix_spawnp*( ) to a subset of the capabilities of *Start_Process* and *Start_Process_Search*; certain
48440 non-default capabilities were not supported. However, based on suggestions by the ballot group
48441 to improve file descriptor mapping or drop it, and on the advice of an Ada Language Bindings
48442 working group member, the standard developers decided that *posix_spawn*( ) and *posix_spawnp*( )
48443 should be sufficiently powerful to implement *Start_Process* and *Start_Process_Search*. The
48444 rationale is that if the Ada language binding to such a primitive had already been approved as
48445 an IEEE standard, there can be little justification for not approving the functionally-equivalent
48446 parts of a C binding. The only three capabilities provided by *posix_spawn*( ) and *posix_spawnp*( )
48447 that are not provided by *Start_Process* and *Start_Process_Search* are optionally specifying the
48448 child's process group ID, the set of signals to be reset to default signal handling in the child
48449 process, and the child's scheduling policy and parameters.

48450 For the Ada language binding for *Start_Process* to be implemented with *posix_spawn*( ), that
48451 binding would need to explicitly pass an empty signal mask and the parent's environment to
48452 *posix_spawn*( ) whenever the caller of *Start_Process* allowed these arguments to default, since
48453 *posix_spawn*( ) does not provide such defaults. The ability of *Start_Process* to mask user-specified
48454 signals during its execution is functionally unique to the Ada language binding and must be
48455 dealt with in the binding separately from the call to *posix_spawn*( ).

48456 **Process Group**

48457 The process group inheritance field can be used to join the child process with an existing process
48458 group. By assigning a value of zero to the *spawn-pgroup* attribute of the object referenced by *attrp*,
48459 the *setpgid*( ) mechanism will place the child process in a new process group.

48460 **Threads**

48461 Without the *posix_spawn*( ) and *posix_spawnp*( ) functions, systems without address translation
48462 can still use threads to give an abstraction of concurrency. In many cases, thread creation
48463 suffices, but it is not always a good substitute. The *posix_spawn*( ) and *posix_spawnp*( ) functions
48464 are considerably ``heavier'' than thread creation. Processes have several important attributes that
48465 threads do not. Even without address translation, a process may have base-and-bound memory
48466 protection. Each process has a process environment including security attributes and file
48467 capabilities, and powerful scheduling attributes. Processes abstract the behavior of non-
48468 uniform-memory-architecture multi-processors better than threads, and they are more
48469 convenient to use for activities that are not closely linked.

48470 The *posix_spawn*( ) and *posix_spawnp*( ) functions may not bring support for multiple processes to
48471 every configuration. Process creation is not the only piece of operating system support required
48472 to support multiple processes. The total cost of support for multiple processes may be quite high
48473 in some circumstances. Existing practice shows that support for multiple processes is
48474 uncommon and threads are common among ``tiny kernels''. There should, therefore, probably
48475 continue to be AEPs for operating systems with only one process.

48476 **Asynchronous Error Notification**

48477 A library implementation of *posix_spawn*( ) or *posix_spawnp*( ) may not be able to detect all
48478 possible errors before it forks the child process. POSIX.1-2017 provides for an error indication
48479 returned from a child process which could not successfully complete the spawn operation via a
48480 special exit status which may be detected using the status value returned by *wait*( ), *waitid*( ), and
48481 *waitpid*( ).

48482 The *stat_val* interface and the macros used to interpret it are not well suited to the purpose of
48483 returning API errors, but they are the only path available to a library implementation. Thus, an
48484 implementation may cause the child process to exit with exit status 127 for any error detected
48485 during the spawn process after the *posix_spawn*( ) or *posix_spawnp*( ) function has successfully
48486 returned.

48487 The standard developers had proposed using two additional macros to interpret *stat_val*. The
48488 first, WIFSPAWNFAIL, would have detected a status that indicated that the child exited because
48489 of an error detected during the *posix_spawn*( ) or *posix_spawnp*( ) operations rather than during
48490 actual execution of the child process image; the second, WSPAWNERRNO, would have
48491 extracted the error value if WIFSPAWNFAIL indicated a failure. Unfortunately, the ballot group
48492 strongly opposed this because it would make a library implementation of *posix_spawn*( ) or
48493 *posix_spawnp*( ) dependent on kernel modifications to *waitpid*( ) to be able to embed special
48494 information in *stat_val* to indicate a spawn failure.

48495 The 8 bits of child process exit status that are guaranteed by POSIX.1-2017 to be accessible to the
48496 waiting parent process are insufficient to disambiguate a spawn error from any other kind of
48497 error that may be returned by an arbitrary process image. No other bits of the exit status are
48498 required to be visible in *stat_val*, so these macros could not be strictly implemented at the library
48499 level. Reserving an exit status of 127 for such spawn errors is consistent with the use of this
48500 value by *system*( ) and *popen*( ) to signal failures in these operations that occur after the function
48501 has returned but before a shell is able to execute. The exit status of 127 does not uniquely

identify this class of error, nor does it provide any detailed information on the nature of the failure. Note that a kernel implementation of *posix_spawn*( ) or *posix_spawnp*( ) is permitted (and encouraged) to return any possible error as the function value, thus providing more detailed failure information to the parent process.

Thus, no special macros are available to isolate asynchronous *posix_spawn*( ) or *posix_spawnp*( ) errors. Instead, errors detected by the *posix_spawn*( ) or *posix_spawnp*( ) operations in the context of the child process before the new process image executes are reported by setting the child's exit status to 127. The calling process may use the WIFEXITED and WEXITSTATUS macros on the *stat_val* stored by the *wait*( ) or *waitpid*( ) functions to detect spawn failures to the extent that other status values with which the child process image may exit (before the parent can conclusively determine that the child process image has begun execution) are distinct from exit status 127.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #103 is applied, noting that the signal default actions are changed as well as the signal mask in step 2.

IEEE PASC Interpretation 1003.1 #132 is applied.

Issue 7

Functionality relating to the Threads option is moved to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0433 [291], XSH/TC1-2008/0434 [173], and XSH/TC1-2008/0435 [173] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0255 [824] is applied.

NAME

posix_spawn_file_actions_addclose, posix_spawn_file_actions_addopen ‡' add close or open action to spawn file actions object (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <spawn.h>

int posix_spawn_file_actions_addclose(posix_spawn_file_actions_t
    *file_actions, int fildes);
int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t
    *restrict file_actions, int fildes,
    const char *restrict path, int oflag, mode_t mode);
```

DESCRIPTION

These functions shall add or delete a close or open action to a spawn file actions object.

A spawn file actions object is of type **posix_spawn_file_actions_t** (defined in **<spawn.h>**) and is used to specify a series of actions to be performed by a *posix_spawn*( ) or *posix_spawnp*( ) operation in order to arrive at the set of open file descriptors for the child process given the set of open file descriptors of the parent. POSIX.1-2017 does not define comparison or assignment operators for the type **posix_spawn_file_actions_t**.

A spawn file actions object, when passed to *posix_spawn*( ) or *posix_spawnp*( ), shall specify how the set of open file descriptors in the calling process is transformed into a set of potentially open file descriptors for the spawned process. This transformation shall be as if the specified sequence of actions was performed exactly once, in the context of the spawned process (prior to execution of the new process image), in the order in which the actions were added to the object; additionally, when the new process image is executed, any file descriptor (from this new set) which has its FD_CLOEXEC flag set shall be closed (see *posix_spawn*( )).

The *posix_spawn_file_actions_addclose*( ) function shall add a *close* action to the object referenced by *file_actions* that shall cause the file descriptor *fildes* to be closed (as if *close*(*fildes*) had been called) when a new process is spawned using this file actions object.

The *posix_spawn_file_actions_addopen*( ) function shall add an *open* action to the object referenced by *file_actions* that shall cause the file named by *path* to be opened (as if *open*(*path*, *oflag*, *mode*) had been called, and the returned file descriptor, if not *fildes*, had been changed to *fildes*) when a new process is spawned using this file actions object. If *fildes* was already an open file descriptor, it shall be closed before the new file is opened.

The string described by *path* shall be copied by the *posix_spawn_file_actions_addopen*( ) function.

RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *posix_spawn_file_actions_addopen*( ) function shall fail if:

[EBADF] The value specified by *fildes* is negative or greater than or equal to {OPEN_MAX}.

The *posix_spawn_file_actions_addclose*( ) function shall fail if:

[EBADF] The value specified by *fildes* is negative.

These functions may fail if:

[EINVAL] The value specified by *file_actions* is invalid.

[ENOMEM] Insufficient memory exists to add to the spawn file actions object.

It shall not be considered an error for the *fildes* argument passed to these functions to specify a file descriptor for which the specified operation could not be performed at the time of the call. Any such error will be detected when the associated file actions object is later used during a *posix_spawn*( ) or *posix_spawnp*( ) operation.

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

Implementations may use file descriptors that must be inherited into child processes for the child process to remain conforming, such as for message catalog or tracing purposes. Therefore, an application that calls *posix_spawn_file_actions_addclose*( ) with an arbitrary integer risks non-conforming behavior, and this function can only portably be used to close file descriptor values that the application has obtained through explicit actions, or for the three file descriptors corresponding to the standard file streams. In order to avoid a race condition of leaking an unintended file descriptor into a child process, an application should consider opening all file descriptors with the FD_CLOEXEC bit set unless the file descriptor is intended to be inherited across *exec*.

RATIONALE

A spawn file actions object may be initialized to contain an ordered sequence of *close*( ), *dup2*( ), and *open*( ) operations to be used by *posix_spawn*( ) or *posix_spawnp*( ) to arrive at the set of open file descriptors inherited by the spawned process from the set of open file descriptors in the parent at the time of the *posix_spawn*( ) or *posix_spawnp*( ) call. It had been suggested that the *close*( ) and *dup2*( ) operations alone are sufficient to rearrange file descriptors, and that files which need to be opened for use by the spawned process can be handled either by having the calling process open them before the *posix_spawn*( ) or *posix_spawnp*( ) call (and close them after), or by passing pathnames to the spawned process (in *argv*) so that it may open them itself. The standard developers recommend that applications use one of these two methods when practical, since detailed error status on a failed open operation is always available to the application this way. However, the standard developers feel that allowing a spawn file actions object to specify open operations is still appropriate because:

1. It is consistent with equivalent POSIX.5 (Ada) functionality.
2. It supports the I/O redirection paradigm commonly employed by POSIX programs designed to be invoked from a shell. When such a program is the child process, it may not be designed to open files on its own.
3. It allows file opens that might otherwise fail or violate file ownership/access rights if executed by the parent process.

Regarding 2. above, note that the spawn open file action provides to *posix_spawn*( ) and *posix_spawnp*( ) the same capability that the shell redirection operators provide to *system*( ), only without the intervening execution of a shell; for example:

```
system ("myprog <file1 3<file2");
```

Regarding 3. above, note that if the calling process needs to open one or more files for access by the spawned process, but has insufficient spare file descriptors, then the open action is necessary

to allow the *open*( ) to occur in the context of the child process after other file descriptors have been closed (that must remain open in the parent).

Additionally, if a parent is executed from a file having a ``set-user-id'' mode bit set and the POSIX_SPAWN_RESETIDS flag is set in the spawn attributes, a file created within the parent process will (possibly incorrectly) have the parent's effective user ID as its owner, whereas a file created via an *open*( ) action during *posix_spawn*( ) or *posix_spawnp*( ) will have the parent's real ID as its owner; and an open by the parent process may successfully open a file to which the real user should not have access or fail to open a file to which the real user should have access.

File Descriptor Mapping

The standard developers had originally proposed using an array which specified the mapping of child file descriptors back to those of the parent. It was pointed out by the ballot group that it is not possible to reshuffle file descriptors arbitrarily in a library implementation of *posix_spawn*( ) or *posix_spawnp*( ) without provision for one or more spare file descriptor entries (which simply may not be available). Such an array requires that an implementation develop a complex strategy to achieve the desired mapping without inadvertently closing the wrong file descriptor at the wrong time.

It was noted by a member of the Ada Language Bindings working group that the approved Ada Language *Start_Process* family of POSIX process primitives use a caller-specified set of file actions to alter the normal *fork*( )/*exec* semantics for inheritance of file descriptors in a very flexible way, yet no such problems exist because the burden of determining how to achieve the final file descriptor mapping is completely on the application. Furthermore, although the file actions interface appears frightening at first glance, it is actually quite simple to implement in either a library or the kernel.

The *posix_spawn_file_actions_addclose*( ) function is not required to check whether the file descriptor is less than {OPEN_MAX} because on some implementations {OPEN_MAX} reflects the RLIMIT_NOFILE soft limit and therefore calling *setrlimit*( ) to reduce this limit can result in an {OPEN_MAX} value less than or equal to an already open file descriptor. Applications need to be able to close such file descriptors on spawn. On implementations where {OPEN_MAX} does not change, it is recommended that *posix_spawn_file_actions_addclose*( ) should return [EBADF] if *fildes* is greater than or equal to {OPEN_MAX}.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #105 is applied, adding a note to the DESCRIPTION that the string pointed to by *path* is copied by the *posix_spawn_file_actions_addopen*( ) function.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0436 [418], XSH/TC1-2008/0437 [149], XSH/TC1-2008/0438 [291], and XSH/TC1-2008/0439 [418] are applied.

NAME

posix_spawn_file_actions_adddup2 ‡' add dup2 action to spawn file actions object (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <spawn.h>

int posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t
    *file_actions, int fildes, int newfildes);
```

DESCRIPTION

The *posix_spawn_file_actions_adddup2*( ) function shall add a *dup2*( ) action to the object referenced by *file_actions* that shall cause the file descriptor *fildes* to be duplicated as *newfildes* (as if *dup2*(*fildes*, *newfildes*) had been called) when a new process is spawned using this file actions object.

A spawn file actions object is as defined in *posix_spawn_file_actions_addclose( )*.

RETURN VALUE

Upon successful completion, the *posix_spawn_file_actions_adddup2*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *posix_spawn_file_actions_adddup2*( ) function shall fail if:

[EBADF] The value specified by *fildes* or *newfildes* is negative or greater than or equal to {OPEN_MAX}.

[ENOMEM] Insufficient memory exists to add to the spawn file actions object.

The *posix_spawn_file_actions_adddup2*( ) function may fail if:

[EINVAL] The value specified by *file_actions* is invalid.

It shall not be considered an error for the *fildes* argument passed to the *posix_spawn_file_actions_adddup2*( ) function to specify a file descriptor for which the specified operation could not be performed at the time of the call. Any such error will be detected when the associated file actions object is later used during a *posix_spawn*( ) or *posix_spawnp*( ) operation.

EXAMPLES

None.

APPLICATION USAGE

The *posix_spawn_file_actions_adddup2*( ) function is part of the Spawn option and need not be provided on all implementations.

Implementations may use file descriptors that must be inherited into child processes for the child process to remain conforming, such as for message catalog or tracing purposes. Therefore, an application that calls *posix_spawn_file_actions_adddup2*( ) with an arbitrary integer for *newfildes* risks non-conforming behavior, and this function can only portably be used to overwrite file descriptor values that the application has obtained through explicit actions, or for the three file descriptors corresponding to the standard file streams. In order to avoid a race condition of leaking an unintended file descriptor into a child process, an application should consider opening all file descriptors with the FD_CLOEXEC bit set unless the file descriptor is intended to be inherited across *exec*.

NAME

posix_spawn_file_actions_addopen ‡′ add open action to spawn file actions object (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <spawn.h>

int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t
    *restrict file_actions, int fildes,
    const char *restrict path, int oflag, mode_t mode);
```

DESCRIPTION

Refer to *posix_spawn_file_actions_addclose( )*.

NAME

posix_spawn_file_actions_destroy, posix_spawn_file_actions_init — destroy and initialize spawn file actions object (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <spawn.h>

int posix_spawn_file_actions_destroy(posix_spawn_file_actions_t
    *file_actions);
int posix_spawn_file_actions_init(posix_spawn_file_actions_t
    *file_actions);
```

DESCRIPTION

The *posix_spawn_file_actions_destroy*( ) function shall destroy the object referenced by *file_actions*; the object becomes, in effect, uninitialized. An implementation may cause *posix_spawn_file_actions_destroy*( ) to set the object referenced by *file_actions* to an invalid value. A destroyed spawn file actions object can be reinitialized using *posix_spawn_file_actions_init*( ); the results of otherwise referencing the object after it has been destroyed are undefined.

The *posix_spawn_file_actions_init*( ) function shall initialize the object referenced by *file_actions* to contain no file actions for *posix_spawn*( ) or *posix_spawnp*( ) to perform.

A spawn file actions object is as defined in *posix_spawn_file_actions_addclose*( ).

The effect of initializing an already initialized spawn file actions object is undefined.

RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *posix_spawn_file_actions_init*( ) function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the spawn file actions object.

The *posix_spawn_file_actions_destroy*( ) function may fail if:

[EINVAL] The value specified by *file_actions* is invalid.

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

RATIONALE

Refer to the RATIONALE section in *posix_spawn_file_actions_addclose*( ).

FUTURE DIRECTIONS

None.

XBD **<spawn.h>**

48767 **CHANGE HISTORY**

48768 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

48769 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

48770 **NAME**

48771 posix_spawnattr_destroy, posix_spawnattr_init ‡'destroy and initialize spawn attributes object
48772 (**ADVANCED REALTIME**)

48773 **SYNOPSIS**

48774 SPN
```
#include <spawn.h>

int posix_spawnattr_destroy(posix_spawnattr_t *attr);
int posix_spawnattr_init(posix_spawnattr_t *attr);
```

48777 **DESCRIPTION**

48778 The *posix_spawnattr_destroy*( ) function shall destroy a spawn attributes object. A destroyed *attr*
48779 attributes object can be reinitialized using *posix_spawnattr_init*( ); the results of otherwise
48780 referencing the object after it has been destroyed are undefined. An implementation may cause
48781 *posix_spawnattr_destroy*( ) to set the object referenced by *attr* to an invalid value.

48782 The *posix_spawnattr_init*( ) function shall initialize a spawn attributes object *attr* with the default
48783 value for all of the individual attributes used by the implementation. Results are undefined if
48784 *posix_spawnattr_init*( ) is called specifying an already initialized *attr* attributes object.

48785 A spawn attributes object is of type **posix_spawnattr_t** (defined in **<spawn.h>**) and is used to
48786 specify the inheritance of process attributes across a spawn operation. POSIX.1-2017 does not
48787 define comparison or assignment operators for the type **posix_spawnattr_t**.

48788 Each implementation shall document the individual attributes it uses and their default values
48789 unless these values are defined by POSIX.1-2017. Attributes not defined by POSIX.1-2017, their
48790 default values, and the names of the associated functions to get and set those attribute values are
48791 implementation-defined.

48792 The resulting spawn attributes object (possibly modified by setting individual attribute values),
48793 is used to modify the behavior of *posix_spawn*( ) or *posix_spawnp*( ). After a spawn attributes
48794 object has been used to spawn a process by a call to a *posix_spawn*( ) or *posix_spawnp*( ), any
48795 function affecting the attributes object (including destruction) shall not affect any process that
48796 has been spawned in this way.

48797 **RETURN VALUE**

48798 Upon successful completion, *posix_spawnattr_destroy*( ) and *posix_spawnattr_init*( ) shall return
48799 zero; otherwise, an error number shall be returned to indicate the error.

48800 **ERRORS**

48801 The *posix_spawnattr_init*( ) function shall fail if:

48802 [ENOMEM] Insufficient memory exists to initialize the spawn attributes object.

48803 The *posix_spawnattr_destroy*( ) function may fail if:

48804 [EINVAL] The value specified by attr is invalid.

48805 **EXAMPLES**

48806 None.

48807 **APPLICATION USAGE**

48808 These functions are part of the Spawn option and need not be provided on all implementations.

48809 **RATIONALE**

48810 The original spawn interface proposed in POSIX.1-2017 defined the attributes that specify the
48811 inheritance of process attributes across a spawn operation as a structure. In order to be able to
48812 separate optional individual attributes under their appropriate options (that is, the *spawn-*
48813 *schedparam* and *spawn-schedpolicy* attributes depending upon the Process Scheduling option), and

also for extensibility and consistency with the newer POSIX interfaces, the attributes interface has been changed to an opaque data type. This interface now consists of the type **posix_spawnattr_t**, representing a spawn attributes object, together with associated functions to initialize or destroy the attributes object, and to set or get each individual attribute. Although the new object-oriented interface is more verbose than the original structure, it is simple to use, more extensible, and easy to implement.

FUTURE DIRECTIONS

None.

SEE ALSO

posix_spawn( ), *posix_spawnattr_getsigdefault*( ), *posix_spawnattr_getflags*( ), *posix_spawnattr_getpgroup*( ), *posix_spawnattr_getschedparam*( ), *posix_spawnattr_getschedpolicy*( ), *posix_spawnattr_getsigmask*( )

XBD **<spawn.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #106 is applied, noting that the effect of initializing an already initialized spawn attributes option is undefined.

NAME

posix_spawnattr_getflags, posix_spawnattr_setflags ‡'get and set the spawn-flags attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

SPN
```
#include <spawn.h>

int posix_spawnattr_getflags(const posix_spawnattr_t *restrict attr,
    short *restrict flags);
int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

DESCRIPTION

The *posix_spawnattr_getflags*( ) function shall obtain the value of the *spawn-flags* attribute from the attributes object referenced by *attr*.

The *posix_spawnattr_setflags*( ) function shall set the *spawn-flags* attribute in an initialized attributes object referenced by *attr*.

The *spawn-flags* attribute is used to indicate which process attributes are to be changed in the new process image when invoking *posix_spawn*( ) or *posix_spawnp*( ). It is the bitwise-inclusive OR of zero or more of the following flags:

POSIX_SPAWN_RESETIDS
POSIX_SPAWN_SETPGROUP
POSIX_SPAWN_SETSIGDEF
POSIX_SPAWN_SETSIGMASK
PS POSIX_SPAWN_SETSCHEDPARAM
POSIX_SPAWN_SETSCHEDULER

These flags are defined in **<spawn.h>**. The default value of this attribute shall be as if no flags were set.

RETURN VALUE

Upon successful completion, *posix_spawnattr_getflags*( ) shall return zero and store the value of the *spawn-flags* attribute of *attr* into the object referenced by the *flags* parameter; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, *posix_spawnattr_setflags*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EINVAL] The value specified by *attr* is invalid.

The *posix_spawnattr_setflags*( ) function may fail if:

[EINVAL] The value of the attribute being set is not valid.

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

XBD **<spawn.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

48881 **NAME**

48882 posix_spawnattr_getpgroup, posix_spawnattr_setpgroup ‡' get and set the spawn-pgroup
48883 attribute of a spawn attributes object (**ADVANCED REALTIME**)

48884 **SYNOPSIS**

48885 SPN
```
#include <spawn.h>

int posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict attr,
    pid_t *restrict pgroup);
int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);
```

48889 **DESCRIPTION**

48890 The *posix_spawnattr_getpgroup*( ) function shall obtain the value of the *spawn-pgroup* attribute
48891 from the attributes object referenced by *attr*.

48892 The *posix_spawnattr_setpgroup*( ) function shall set the *spawn-pgroup* attribute in an initialized
48893 attributes object referenced by *attr*.

48894 The *spawn-pgroup* attribute represents the process group to be joined by the new process image
48895 in a spawn operation (if POSIX_SPAWN_SETPGROUP is set in the *spawn-flags* attribute). The
48896 default value of this attribute shall be zero.

48897 **RETURN VALUE**

48898 Upon successful completion, *posix_spawnattr_getpgroup*( ) shall return zero and store the value of
48899 the *spawn-pgroup* attribute of *attr* into the object referenced by the *pgroup* parameter; otherwise,
48900 an error number shall be returned to indicate the error.

48901 Upon successful completion, *posix_spawnattr_setpgroup*( ) shall return zero; otherwise, an error
48902 number shall be returned to indicate the error.

48903 **ERRORS**

48904 These functions may fail if:

48905 [EINVAL] The value specified by *attr* is invalid.

48906 The *posix_spawnattr_setpgroup*( ) function may fail if:

48907 [EINVAL] The value of the attribute being set is not valid.

48908 **EXAMPLES**

48909 None.

NAME

posix_spawnattr_getschedparam, posix_spawnattr_setschedparam ‡' get and set the spawn-schedparam attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

SPN PS

```
#include <spawn.h>
#include <sched.h>

int posix_spawnattr_getschedparam(const posix_spawnattr_t
    *restrict attr, struct sched_param *restrict schedparam);
int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,
    const struct sched_param *restrict schedparam);
```

DESCRIPTION

The *posix_spawnattr_getschedparam*( ) function shall obtain the value of the *spawn-schedparam* attribute from the attributes object referenced by *attr*.

The *posix_spawnattr_setschedparam*( ) function shall set the *spawn-schedparam* attribute in an initialized attributes object referenced by *attr*.

The *spawn-schedparam* attribute represents the scheduling parameters to be assigned to the new process image in a spawn operation (if POSIX_SPAWN_SETSCHEDULER or POSIX_SPAWN_SETSCHEDPARAM is set in the *spawn-flags* attribute). The default value of this attribute is unspecified.

RETURN VALUE

Upon successful completion, *posix_spawnattr_getschedparam*( ) shall return zero and store the value of the *spawn-schedparam* attribute of *attr* into the object referenced by the *schedparam* parameter; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, *posix_spawnattr_setschedparam*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EINVAL] The value specified by *attr* is invalid.

The *posix_spawnattr_setschedparam*( ) function may fail if:

    const sigset_t *restrict sigmask);
```

DESCRIPTION

The *posix_spawnattr_getsigmask*( ) function shall obtain the value of the *spawn-sigmask* attribute from the attributes object referenced by *attr*.

The *posix_spawnattr_setsigmask*( ) function shall set the *spawn-sigmask* attribute in an initialized attributes object referenced by *attr*.

The *spawn-sigmask* attribute represents the signal mask in effect in the new process image of a spawn operation (if POSIX_SPAWN_SETSIGMASK is set in the *spawn-flags* attribute). The default value of this attribute is unspecified.

RETURN VALUE

Upon successful completion, *posix_spawnattr_getsigmask*( ) shall return zero and store the value of the *spawn-sigmask* attribute of *attr* into the object referenced by the *sigmask* parameter; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, *posix_spawnattr_setsigmask*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EINVAL] The value specified by *attr* is invalid.

The *posix_spawnattr_setsigmask*( ) function may fail if:

[EINVAL] The value of the attribute being set is not valid.

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

posix_spawnattr_init ‡ initialize the spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <spawn.h>

int posix_spawnattr_init(posix_spawnattr_t *attr);
```

DESCRIPTION

Refer to *posix_spawnattr_destroy( )*.

NAME

posix_spawnattr_setflags ‡′ set the spawn-flags attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <spawn.h>

int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

DESCRIPTION

Refer to *posix_spawnattr_getflags*( ).

NAME

posix_spawnattr_setpgroup ‡′ set the spawn-pgroup attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <spawn.h>

int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);
```

DESCRIPTION

Refer to *posix_spawnattr_getpgroup( )*.

NAME

posix_spawnattr_setschedparam ‡′ set the spawn-schedparam attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

SPN PS

```
#include <sched.h>
#include <spawn.h>

int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,
    const struct sched_param *restrict schedparam);
```

DESCRIPTION

Refer to *posix_spawnattr_getschedparam( )*.

NAME

posix_spawnattr_setschedpolicy ‡' set the spawn-schedpolicy attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

SPN PS

```
#include <sched.h>
#include <spawn.h>

int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,
    int schedpolicy);
```

DESCRIPTION

Refer to *posix_spawnattr_getschedpolicy( )*.

NAME

posix_spawnattr_setsigdefault ‡'set the spawn-sigdefault attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <signal.h>

    const sigset_t *restrict sigmask);
```

DESCRIPTION

Refer to *posix_spawnattr_getsigmask( )*.

NAME

posix_spawnp — spawn a process (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <spawn.h>

int posix_spawnp(pid_t *restrict pid, const char *restrict file,
    const posix_spawn_file_actions_t *file_actions,
    const posix_spawnattr_t *restrict attrp,
    char *const argv[restrict], char *const envp[restrict]);
```

DESCRIPTION

Refer to *posix_spawn( )*.

NAME

posix_trace_attr_destroy, posix_trace_attr_init ‡ destroy and initialize the trace stream attributes object (**TRACING**)

SYNOPSIS

OB TRC

```
#include <trace.h>

int posix_trace_attr_destroy(trace_attr_t *attr);
int posix_trace_attr_init(trace_attr_t *attr);
```

DESCRIPTION

The *posix_trace_attr_destroy*( ) function shall destroy an initialized trace attributes object. A destroyed *attr* attributes object can be reinitialized using *posix_trace_attr_init*( ); the results of otherwise referencing the object after it has been destroyed are undefined.

The *posix_trace_attr_init*( ) function shall initialize a trace attributes object *attr* with the default value for all of the individual attributes used by a given implementation. The read-only *generation-version* and *clock-resolution* attributes of the newly initialized trace attributes object shall be set to their appropriate values (see Section 2.11.1.2, on page 542).

Results are undefined if *posix_trace_attr_init*( ) is called specifying an already initialized *attr* attributes object.

Implementations may add extensions to the trace attributes object structure as permitted in XBD Chapter 2 (on page 15).

The resulting attributes object (possibly modified by setting individual attributes values), when used by *posix_trace_create*( ), defines the attributes of the trace stream created. A single attributes object can be used in multiple calls to *posix_trace_create*( ). After one or more trace streams have been created using an attributes object, any function affecting that attributes object, including destruction, shall not affect any trace stream previously created. An initialized attributes object also serves to receive the attributes of an existing trace stream or trace log when calling the *posix_trace_get_attr*( ) function.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

ERRORS

The *posix_trace_attr_destroy*( ) function may fail if:

[EINVAL] The value of *attr* is invalid.

The *posix_trace_attr_init*( ) function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the trace attributes object.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_attr_destroy*( ) and *posix_trace_attr_init*( ) functions may be removed in a future version.

SEE ALSO

posix_trace_create( ), *posix_trace_get_attr*( ), *uname*( )

XBD **<trace.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

IEEE PASC Interpretation 1003.1 #123 is applied.

Issue 7

The *posix_trace_attr_destroy*( ) and *posix_trace_attr_init*( ) functions are marked obsolescent.

NAME

posix_trace_attr_getclockres, posix_trace_attr_getcreatetime, posix_trace_attr_getgenversion, posix_trace_attr_getname, posix_trace_attr_setname — retrieve and set information about a trace stream (**TRACING**)

SYNOPSIS

OB TRC

```
#include <time.h>
#include <trace.h>

int posix_trace_attr_getclockres(const trace_attr_t *attr,
    struct timespec *resolution);
int posix_trace_attr_getcreatetime(const trace_attr_t *attr,
    struct timespec *createtime);

#include <trace.h>

int posix_trace_attr_getgenversion(const trace_attr_t *attr,
    char *genversion);
int posix_trace_attr_getname(const trace_attr_t *attr,
    char *tracename);
int posix_trace_attr_setname(trace_attr_t *attr,
    const char *tracename);
```

DESCRIPTION

The *posix_trace_attr_getclockres*( ) function shall copy the clock resolution of the clock used to generate timestamps from the *clock-resolution* attribute of the attributes object pointed to by the *attr* argument into the structure pointed to by the *resolution* argument.

The *posix_trace_attr_getcreatetime*( ) function shall copy the trace stream creation time from the *creation-time* attribute of the attributes object pointed to by the *attr* argument into the structure pointed to by the *createtime* argument. The *creation-time* attribute shall represent the time of creation of the trace stream.

The *posix_trace_attr_getgenversion*( ) function shall copy the string containing version information from the *generation-version* attribute of the attributes object pointed to by the *attr* argument into the string pointed to by the *genversion* argument. The *genversion* argument shall be the address of a character array which can store at least {TRACE_NAME_MAX} characters.

The *posix_trace_attr_getname*( ) function shall copy the string containing the trace name from the *trace-name* attribute of the attributes object pointed to by the *attr* argument into the string pointed to by the *tracename* argument. The *tracename* argument shall be the address of a character array which can store at least {TRACE_NAME_MAX} characters.

The *posix_trace_attr_setname*( ) function shall set the name in the *trace-name* attribute of the attributes object pointed to by the *attr* argument, using the trace name string supplied by the *tracename* argument. If the supplied string contains more than {TRACE_NAME_MAX} characters, the name copied into the *trace-name* attribute may be truncated to one less than the length of {TRACE_NAME_MAX} characters. The default value is a null string.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

If successful, the *posix_trace_attr_getclockres*( ) function stores the *clock-resolution* attribute value in the object pointed to by *resolution*. Otherwise, the content of this object is unspecified.

If successful, the *posix_trace_attr_getcreatetime*( ) function stores the trace stream creation time in

the object pointed to by *createtime*. Otherwise, the content of this object is unspecified.

If successful, the *posix_trace_attr_getgenversion*( ) function stores the trace version information in the string pointed to by *genversion*. Otherwise, the content of this string is unspecified.

If successful, the *posix_trace_attr_getname*( ) function stores the trace name in the string pointed to by *tracename*. Otherwise, the content of this string is unspecified.

ERRORS

The *posix_trace_attr_getclockres*( ), *posix_trace_attr_getcreatetime*( ), *posix_trace_attr_getgenversion*( ), and *posix_trace_attr_getname*( ) functions may fail if:

[EINVAL] The value specified by one of the arguments is invalid.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_attr_getclockres*( ), *posix_trace_attr_getcreatetime*( ), *posix_trace_attr_getgenversion*( ), *posix_trace_attr_getname*( ), and *posix_trace_attr_setname*( ) functions may be removed in a future version.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

Issue 7

The *posix_trace_attr_getclockres*( ), *posix_trace_attr_getcreatetime*( ), *posix_trace_attr_getgenversion*( ), *posix_trace_attr_getname*( ), and *posix_trace_attr_setname*( ) functions are marked obsolescent.

NAME

posix_trace_attr_getinherited, posix_trace_attr_getlogfullpolicy, posix_trace_attr_getstreamfullpolicy, posix_trace_attr_setinherited, posix_trace_attr_setlogfullpolicy, posix_trace_attr_setstreamfullpolicy — retrieve and set the behavior of a trace stream (**TRACING**)

SYNOPSIS

OB TRC
```
#include <trace.h>

int posix_trace_attr_getinherited(const trace_attr_t *restrict attr,
    int *restrict inheritancepolicy);
int posix_trace_attr_getlogfullpolicy(const trace_attr_t *restrict attr,
    int *restrict logpolicy);
int posix_trace_attr_getstreamfullpolicy(const trace_attr_t *restrict
    attr, int *restrict streampolicy);
int posix_trace_attr_setinherited(trace_attr_t *attr,
    int inheritancepolicy);
int posix_trace_attr_setlogfullpolicy(trace_attr_t *attr,
    int logpolicy);
int posix_trace_attr_setstreamfullpolicy(trace_attr_t *attr,
    int streampolicy);
```

DESCRIPTION

TRI The *posix_trace_attr_getinherited*( ) and *posix_trace_attr_setinherited*( ) functions, respectively, shall get and set the inheritance policy stored in the *inheritance* attribute for traced processes across the *fork*( ) and *spawn*( ) operations. The *inheritance* attribute of the attributes object pointed to by the *attr* argument shall be set to one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_CLOSE_FOR_CHILD
: After a *fork*( ) or *spawn*( ) operation, the child shall not be traced, and tracing of the parent shall continue.

POSIX_TRACE_INHERITED
: After a *fork*( ) or *spawn*( ) operation, if the parent is being traced, its child shall be concurrently traced using the same trace stream.

The default value for the *inheritance* attribute is POSIX_TRACE_CLOSE_FOR_CHILD.

TRL The *posix_trace_attr_getlogfullpolicy*( ) and *posix_trace_attr_setlogfullpolicy*( ) functions, respectively, shall get and set the trace log full policy stored in the *log-full-policy* attribute of the attributes object pointed to by the *attr* argument.

The *log-full-policy* attribute shall be set to one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_LOOP
: The trace log shall loop until the associated trace stream is stopped. This policy means that when the trace log gets full, the file system shall reuse the resources allocated to the oldest trace events that were recorded. In this way, the trace log will always contain the most recent trace events flushed.

POSIX_TRACE_UNTIL_FULL
: The trace stream shall be flushed to the trace log until the trace log is full. This condition can be deduced from the *posix_log_full_status* member status (see the **posix_trace_status_info** structure defined in **<trace.h>**). The last recorded trace event shall be the POSIX_TRACE_STOP trace event.

POSIX_TRACE_APPEND
The associated trace stream shall be flushed to the trace log without log size limitation. If the application specifies POSIX_TRACE_APPEND, the implementation shall ignore the *log-max-size* attribute.

The default value for the *log-full-policy* attribute is POSIX_TRACE_LOOP.

The *posix_trace_attr_getstreamfullpolicy*( ) and *posix_trace_attr_setstreamfullpolicy*( ) functions, respectively, shall get and set the trace stream full policy stored in the *stream-full-policy* attribute of the attributes object pointed to by the *attr* argument.

The *stream-full-policy* attribute shall be set to one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_LOOP
The trace stream shall loop until explicitly stopped by the *posix_trace_stop*( ) function. This policy means that when the trace stream is full, the trace system shall reuse the resources allocated to the oldest trace events recorded. In this way, the trace stream will always contain the most recent trace events recorded.

POSIX_TRACE_UNTIL_FULL
The trace stream will run until the trace stream resources are exhausted. Then the trace stream will stop. This condition can be deduced from *posix_stream_status* and *posix_stream_full_status* (see the **posix_trace_status_info** structure defined in **<trace.h>**). When this trace stream is read, a POSIX_TRACE_STOP trace event shall be reported after reporting the last recorded trace event. The trace system shall reuse the resources allocated to any trace events already reported—see the *posix_trace_getnext_event*( ), *posix_trace_trygetnext_event*( ), and *posix_trace_timedgetnext_event*( ) functions ‡for already flushed for an active trace stream with log if the Trace Log option is supported; see the *posix_trace_flush*( ) function. The trace system shall restart the trace stream when it is empty and may restart it sooner. A POSIX_TRACE_START trace event shall be reported before reporting the next recorded trace event.

TRL POSIX_TRACE_FLUSH
If the Trace Log option is supported, this policy is identical to the POSIX_TRACE_UNTIL_FULL trace stream full policy except that the trace stream shall be flushed regularly as if *posix_trace_flush*( ) had been explicitly called. Defining this policy for an active trace stream without log shall be invalid.

The default value for the *stream-full-policy* attribute shall be POSIX_TRACE_LOOP for an active trace stream without log.

TRL If the Trace Log option is supported, the default value for the *stream-full-policy* attribute shall be POSIX_TRACE_FLUSH for an active trace stream with log.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

TRI If successful, the *posix_trace_attr_getinherited*( ) function shall store the *inheritance* attribute value in the object pointed to by *inheritancepolicy*. Otherwise, the content of this object is undefined.

TRL If successful, the *posix_trace_attr_getlogfullpolicy*( ) function shall store the *log-full-policy* attribute value in the object pointed to by *logpolicy*. Otherwise, the content of this object is undefined.

If successful, the *posix_trace_attr_getstreamfullpolicy*( ) function shall store the *stream-full-policy* attribute value in the object pointed to by *streampolicy*. Otherwise, the content of this object is undefined.

ERRORS

These functions may fail if:

[EINVAL] The value specified by at least one of the arguments is invalid.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The following functions:

posix_trace_attr_getinherited( )
posix_trace_attr_getlogfullpolicy( )
posix_trace_attr_getstreamfullpolicy( )
posix_trace_attr_setinherited( )
posix_trace_attr_setlogfullpolicy( )
posix_trace_attr_setstreamfullpolicy( )

may be removed in a future version.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/39 is applied, adding the TRL and TRC margin codes to the *posix_trace_attr_setlogfullpolicy*( ) function.

Issue 7

SD5-XSH-ERN-116 is applied, adding the missing **restrict** keyword to the *posix_trace_attr_getstreamfullpolicy*( ) function declaration.

These functions are marked obsolescent.

NAME

posix_trace_attr_getlogsize, posix_trace_attr_getmaxdatasize, posix_trace_attr_getmaxsystemeventsize, posix_trace_attr_getmaxuserevent size, posix_trace_attr_getstreamsize, posix_trace_attr_setlogsize, posix_trace_attr_setmaxdatasize, posix_trace_attr_setstreamsize — retrieve and set trace stream size attributes (**TRACING**)

SYNOPSIS

OB TRC
```
#include <sys/types.h>
#include <trace.h>

int posix_trace_attr_getlogsize(const trace_attr_t *restrict attr,
    size_t *restrict logsize);
int posix_trace_attr_getmaxdatasize(const trace_attr_t *restrict attr,
    size_t *restrict maxdatasize);
int posix_trace_attr_getmaxsystemeventsize(
    const trace_attr_t *restrict attr,
    size_t *restrict eventsize);
int posix_trace_attr_getmaxuserevent size(
    const trace_attr_t *restrict attr,
    size_t data_len, size_t *restrict eventsize);
int posix_trace_attr_getstreamsize(const trace_attr_t *restrict attr,
    size_t *restrict streamsize);
int posix_trace_attr_setlogsize(trace_attr_t *attr,
    size_t logsize);
int posix_trace_attr_setmaxdatasize(trace_attr_t *attr,
    size_t maxdatasize);
int posix_trace_attr_setstreamsize(trace_attr_t *attr,
    size_t streamsize);
```

DESCRIPTION

TRL The *posix_trace_attr_getlogsize*( ) function shall copy the log size, in bytes, from the *log-max-size* attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by the *logsize* argument. This log size is the maximum total of bytes that shall be allocated for system and user trace events in the trace log. The default value for the *log-max-size* attribute is implementation-defined.

The *posix_trace_attr_setlogsize*( ) function shall set the maximum allowed size, in bytes, in the *log-max-size* attribute of the attributes object pointed to by the *attr* argument, using the size value supplied by the *logsize* argument.

The trace log size shall be used if the *log-full-policy* attribute is set to POSIX_TRACE_LOOP or POSIX_TRACE_UNTIL_FULL. If the *log-full-policy* attribute is set to POSIX_TRACE_APPEND, the implementation shall ignore the *log-max-size* attribute.

The *posix_trace_attr_getmaxdatasize*( ) function shall copy the maximum user trace event data size, in bytes, from the *max-data-size* attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by the *maxdatasize* argument. The default value for the *max-data-size* attribute is implementation-defined.

The *posix_trace_attr_getmaxsystemeventsize*( ) function shall calculate the maximum memory size, in bytes, required to store a single system trace event. This value is calculated for the trace stream attributes object pointed to by the *attr* argument and is returned in the variable pointed to by the *eventsize* argument.

The values returned as the maximum memory sizes of the user and system trace events shall be such that if the sum of the maximum memory sizes of a set of the trace events that may be

recorded in a trace stream is less than or equal to the *stream-min-size* attribute of that trace stream, the system provides the necessary resources for recording all those trace events, without loss.

The *posix_trace_attr_getmaxusereventsize*( ) function shall calculate the maximum memory size, in bytes, required to store a single user trace event generated by a call to *posix_trace_event*( ) with a *data_len* parameter equal to the *data_len* value specified in this call. This value is calculated for the trace stream attributes object pointed to by the *attr* argument and is returned in the variable pointed to by the *eventsize* argument.

The *posix_trace_attr_getstreamsize*( ) function shall copy the stream size, in bytes, from the *stream-min-size* attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by the *streamsize* argument.

This stream size is the current total memory size reserved for system and user trace events in the trace stream. The default value for the *stream-min-size* attribute is implementation-defined. The stream size refers to memory used to store trace event records. Other stream data (for example, trace attribute values) shall not be included in this size.

The *posix_trace_attr_setmaxdatasize*( ) function shall set the maximum allowed size, in bytes, in the *max-data-size* attribute of the attributes object pointed to by the *attr* argument, using the size value supplied by the *maxdatasize* argument. This maximum size is the maximum allowed size for the user data argument which may be passed to *posix_trace_event*( ). The implementation shall be allowed to truncate data passed to *trace_user_event* which is longer than *maxdatasize*.

The *posix_trace_attr_setstreamsize*( ) function shall set the minimum allowed size, in bytes, in the *stream-min-size* attribute of the attributes object pointed to by the *attr* argument, using the size value supplied by the *streamsize* argument.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

TRL The *posix_trace_attr_getlogsize*( ) function stores the maximum trace log allowed size in the object pointed to by *logsize*, if successful.

The *posix_trace_attr_getmaxdatasize*( ) function stores the maximum trace event record memory size in the object pointed to by *maxdatasize*, if successful.

The *posix_trace_attr_getmaxsystemeventsize*( ) function stores the maximum memory size to store a single system trace event in the object pointed to by *eventsize*, if successful.

The *posix_trace_attr_getmaxusereventsize*( ) function stores the maximum memory size to store a single user trace event in the object pointed to by *eventsize*, if successful.

The *posix_trace_attr_getstreamsize*( ) function stores the maximum trace stream allowed size in the object pointed to by *streamsize*, if successful.

ERRORS

These functions may fail if:

[EINVAL] The value specified by one of the arguments is invalid.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

OB TRC

```
#include <trace.h>

int posix_trace_attr_setstreamfullpolicy(trace_attr_t *attr,
    int streampolicy);
```

DESCRIPTION

Refer to *posix_trace_attr_getinherited( )*.

NAME

posix_trace_attr_setstreamsize — retrieve and set trace stream size attributes (**TRACING**)

SYNOPSIS

OB TRC

```
#include <sys/types.h>
#include <trace.h>

int posix_trace_attr_setstreamsize(trace_attr_t *attr,
    size_t streamsize);
```

DESCRIPTION

Refer to *posix_trace_attr_getlogsize( )*.

NAME

posix_trace_clear — clear trace stream and trace log (**TRACING**)

SYNOPSIS

OB TRC

```
#include <sys/types.h>
#include <trace.h>

int posix_trace_clear(trace_id_t trid);
```

DESCRIPTION

The *posix_trace_clear*( ) function shall reinitialize the trace stream identified by the argument *trid* as if it were returning from the *posix_trace_create*( ) function, except that the same allocated resources shall be reused, the mapping of trace event type identifiers to trace event names shall be unchanged, and the trace stream status shall remain unchanged (that is, if it was running, it remains running and if it was suspended, it remains suspended).

All trace events in the trace stream recorded before the call to *posix_trace_clear*( ) shall be lost. The *posix_stream_full_status* status shall be set to POSIX_TRACE_NOT_FULL. There is no guarantee that all trace events that occurred during the *posix_trace_clear*( ) call are recorded; the behavior with respect to trace points that may occur during this call is unspecified.

OB TRL If the Trace Log option is supported and the trace stream has been created with a log, the *posix_trace_clear*( ) function shall reinitialize the trace stream with the same behavior as if the trace stream was created without the log, plus it shall reinitialize the trace log associated with the trace stream identified by the argument *trid* as if it were returning from the *posix_trace_create_withlog*( ) function, except that the same allocated resources, for the trace log, may be reused and the associated trace stream status remains unchanged. The first trace event recorded in the trace log after the call to *posix_trace_clear*( ) shall be the same as the first trace event recorded in the active trace stream after the call to *posix_trace_clear*( ). The *posix_log_full_status* status shall be set to POSIX_TRACE_NOT_FULL. There is no guarantee that all trace events that occurred during the *posix_trace_clear*( ) call are recorded in the trace log; the behavior with respect to trace points that may occur during this call is unspecified. If the log full policy is POSIX_TRACE_APPEND, the effect of a call to this function is unspecified for the trace log associated with the trace stream identified by the *trid* argument.

RETURN VALUE

Upon successful completion, the *posix_trace_clear*( ) function shall return a value of zero. Otherwise, it shall return the corresponding error number.

ERRORS

The *posix_trace_clear*( ) function shall fail if:

[EINVAL] The value of the *trid* argument does not correspond to an active trace stream.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_clear*( ) function may be removed in a future version.

49662 **Issue 7**

49663 The *posix_trace_clear( )* function is marked obsolescent.

NAME

posix_trace_close, posix_trace_open, posix_trace_rewind — trace log management (**TRACING**)

SYNOPSIS

OB TRC
```
#include <trace.h>
```

TRL
```
int posix_trace_close(trace_id_t trid);
int posix_trace_open(int file_desc, trace_id_t *trid);
int posix_trace_rewind(trace_id_t trid);
```

DESCRIPTION

The *posix_trace_close*( ) function shall deallocate the trace log identifier indicated by *trid*, and all of its associated resources. If there is no valid trace log pointed to by the *trid*, this function shall fail.

The *posix_trace_open*( ) function shall allocate the necessary resources and establish the connection between a trace log identified by the *file_desc* argument and a trace stream identifier identified by the object pointed to by the *trid* argument. The *file_desc* argument should be a valid open file descriptor that corresponds to a trace log. The *file_desc* argument shall be open for reading. The current trace event timestamp, which specifies the timestamp of the trace event that will be read by the next call to *posix_trace_getnext_event*( ), shall be set to the timestamp of the oldest trace event recorded in the trace log identified by *trid*.

The *posix_trace_open*( ) function shall return a trace stream identifier in the variable pointed to by the *trid* argument, that may only be used by the following functions:

posix_trace_close( )	*posix_trace_get_attr*( )
posix_trace_eventid_equal( )	*posix_trace_get_status*( )
posix_trace_eventid_get_name( )	*posix_trace_getnext_event*( )
posix_trace_eventtypelist_getnext_id( )	*posix_trace_rewind*( )
posix_trace_eventtypelist_rewind( )	

In particular, notice that the operations normally used by a trace controller process, such as *posix_trace_start*( ), *posix_trace_stop*( ), or *posix_trace_shutdown*( ), cannot be invoked using the trace stream identifier returned by the *posix_trace_open*( ) function.

The *posix_trace_rewind*( ) function shall reset the current trace event timestamp, which specifies the timestamp of the trace event that will be read by the next call to *posix_trace_getnext_event*( ), to the timestamp of the oldest trace event recorded in the trace log identified by *trid*.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

If successful, the *posix_trace_open*( ) function stores the trace stream identifier value in the object pointed to by *trid*.

ERRORS

The *posix_trace_open*( ) function shall fail if:

[EINTR] The operation was interrupted by a signal and thus no trace log was opened.

[EINVAL] The object pointed to by *file_desc* does not correspond to a valid trace log.

The *posix_trace_close*( ) and *posix_trace_rewind*( ) functions may fail if:

[EINVAL] The object pointed to by *trid* does not correspond to a valid trace log.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_close*( ), *posix_trace_open*( ), and *posix_trace_rewind*( ) functions may be removed in a future version.

Issue 7

The *posix_trace_close*( ), *posix_trace_open*( ), and *posix_trace_rewind*( ) functions are marked obsolescent.

NAME

posix_trace_create, posix_trace_create_withlog, posix_trace_flush, posix_trace_shutdown ‡' trace stream initialization, flush, and shutdown from a process (**TRACING**)

SYNOPSIS

OB TRC
```
#include <sys/types.h>
#include <trace.h>

int posix_trace_create(pid_t pid,
    const trace_attr_t *restrict attr,
    trace_id_t *restrict trid);
```
TRL
```
int posix_trace_create_withlog(pid_t pid,
    const trace_attr_t *restrict attr, int file_desc,
    trace_id_t *restrict trid);
int posix_trace_flush(trace_id_t trid);
```
OB TRC
```
int posix_trace_shutdown(trace_id_t trid);
```

DESCRIPTION

The *posix_trace_create*( ) function shall create an active trace stream. It allocates all the resources needed by the trace stream being created for tracing the process specified by *pid* in accordance with the *attr* argument. The *attr* argument represents the initial attributes of the trace stream and shall have been initialized by the function *posix_trace_attr_init*( ) prior to the *posix_trace_create*( ) call. If the argument *attr* is NULL, the default attributes shall be used. The *attr* attributes object shall be manipulated through a set of functions described in the *posix_trace_attr* family of functions. If the attributes of the object pointed to by *attr* are modified later, the attributes of the trace stream shall not be affected. The *creation-time* attribute of the newly created trace stream shall be set to the value of the system clock, if the Timers option is not supported, or to the value of the CLOCK_REALTIME clock, if the Timers option is supported.

The *pid* argument represents the target process to be traced. If the process executing this function does not have appropriate privileges to trace the process identified by *pid*, an error shall be returned. If the *pid* argument is zero, the calling process shall be traced.

The *posix_trace_create*( ) function shall store the trace stream identifier of the new trace stream in the object pointed to by the *trid* argument. This trace stream identifier shall be used in subsequent calls to control tracing. The *trid* argument may only be used by the following functions:

posix_trace_clear( )	*posix_trace_getnext_event*( )
posix_trace_eventid_equal( )	*posix_trace_shutdown*( )
posix_trace_eventid_get_name( )	*posix_trace_start*( )
posix_trace_eventtypelist_getnext_id( )	*posix_trace_stop*( )
posix_trace_eventtypelist_rewind( )	*posix_trace_timedgetnext_event*( )
posix_trace_get_attr( )	*posix_trace_trid_eventid_open*( )
posix_trace_get_status( )	*posix_trace_trygetnext_event*( )

TEF If the Trace Event Filter option is supported, the following additional functions may use the *trid* argument:

posix_trace_get_filter( ) *posix_trace_set_filter*( )

In particular, notice that the operations normally used by a trace analyzer process, such as *posix_trace_rewind*( ) or *posix_trace_close*( ), cannot be invoked using the trace stream identifier returned by the *posix_trace_create*( ) function.

TEF A trace stream shall be created in a suspended state. If the Trace Event Filter option is supported, its trace event type filter shall be empty.

The *posix_trace_create*( ) function may be called multiple times from the same or different processes, with the system-wide limit indicated by the runtime invariant value {TRACE_SYS_MAX}, which has the minimum value {_POSIX_TRACE_SYS_MAX}.

The trace stream identifier returned by the *posix_trace_create*( ) function in the argument pointed to by *trid* is valid only in the process that made the function call. If it is used from another process, that is a child process, in functions defined in POSIX.1-2017, these functions shall return with the error [EINVAL].

TRL The *posix_trace_create_withlog*( ) function shall be equivalent to *posix_trace_create*( ), except that it associates a trace log with this stream. The *file_desc* argument shall be the file descriptor designating the trace log destination. The function shall fail if this file descriptor refers to a file with a file type that is not compatible with the log policy associated with the trace log. The list of the appropriate file types that are compatible with each log policy is implementation-defined.

The *posix_trace_create_withlog*( ) function shall return in the parameter pointed to by *trid* the trace stream identifier, which uniquely identifies the newly created trace stream, and shall be used in subsequent calls to control tracing. The *trid* argument may only be used by the following functions:

posix_trace_clear( )	*posix_trace_get_status*( )
posix_trace_eventid_equal( )	*posix_trace_getnext_event*( )
posix_trace_eventid_get_name( )	*posix_trace_shutdown*( )
posix_trace_eventtypelist_getnext_id( )	*posix_trace_start*( )
posix_trace_eventtypelist_rewind( )	*posix_trace_stop*( )
posix_trace_flush( )	*posix_trace_timedgetnext_event*( )
posix_trace_get_attr( )	*posix_trace_trid_eventid_open*( )

TEF TRL If the Trace Event Filter option is supported, the following additional functions may use the *trid* argument:

posix_trace_get_filter( ) *posix_trace_set_filter*( )

TRL In particular, notice that the operations normally used by a trace analyzer process, such as *posix_trace_rewind*( ) or *posix_trace_close*( ), cannot be invoked using the trace stream identifier returned by the *posix_trace_create_withlog*( ) function.

The *posix_trace_flush*( ) function shall initiate a flush operation which copies the contents of the trace stream identified by the argument *trid* into the trace log associated with the trace stream at the creation time. If no trace log has been associated with the trace stream pointed to by *trid*, this function shall return an error. The termination of the flush operation can be polled by the *posix_trace_get_status*( ) function. During the flush operation, it shall be possible to trace new trace events up to the point when the trace stream becomes full. After flushing is completed, the space used by the flushed trace events shall be available for tracing new trace events.

If flushing the trace stream causes the resulting trace log to become full, the trace log full policy shall be applied. If the trace *log-full-policy* attribute is set, the following occurs:

POSIX_TRACE_UNTIL_FULL
The trace events that have not yet been flushed shall be discarded.

POSIX_TRACE_LOOP
The trace events that have not yet been flushed shall be written to the beginning of the trace log, overwriting previous trace events stored there.

POSIX_TRACE_APPEND
The trace events that have not yet been flushed shall be appended to the trace log.

The *posix_trace_shutdown*( ) function shall stop the tracing of trace events in the trace stream identified by *trid*, as if *posix_trace_stop*( ) had been invoked. The *posix_trace_shutdown*( ) function shall free all the resources associated with the trace stream.

The *posix_trace_shutdown*( ) function shall not return until all the resources associated with the trace stream have been freed. When the *posix_trace_shutdown*( ) function returns, the *trid* argument becomes an invalid trace stream identifier. A call to this function shall unconditionally deallocate the resources regardless of whether all trace events have been retrieved by the analyzer process. Any thread blocked on one of the *trace_getnext_event*( ) functions (which specified this *trid*) before this call is unblocked with the error [EINVAL].

If the process exits, invokes a member of the *exec* family of functions, or is terminated, the trace streams that the process had created and that have not yet been shut down, shall be automatically shut down as if an explicit call were made to the *posix_trace_shutdown*( ) function.

TRL For an active trace stream with log, when the *posix_trace_shutdown*( ) function is called, all trace events that have not yet been flushed to the trace log shall be flushed, as in the *posix_trace_flush*( ) function, and the trace log shall be closed.

When a trace log is closed, all the information that may be retrieved later from the trace log through the trace interface shall have been written to the trace log. This information includes the trace attributes, the list of trace event types (with the mapping between trace event names and trace event type identifiers), and the trace status.

In addition, unspecified information shall be written to the trace log to allow detection of a valid trace log during the *posix_trace_open*( ) operation.

The *posix_trace_shutdown*( ) function shall not return until all trace events have been flushed.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

TRL The *posix_trace_create*( ) and *posix_trace_create_withlog*( ) functions store the trace stream identifier value in the object pointed to by *trid*, if successful.

ERRORS

TRL The *posix_trace_create*( ) and *posix_trace_create_withlog*( ) functions shall fail if:

[EAGAIN] No more trace streams can be started now. {TRACE_SYS_MAX} has been exceeded.

[EINTR] The operation was interrupted by a signal. No trace stream was created.

[EINVAL] One or more of the trace parameters specified by the *attr* parameter is invalid.

[ENOMEM] The implementation does not currently have sufficient memory to create the trace stream with the specified parameters.

[EPERM] The caller does not have appropriate privileges to trace the process specified by *pid*.

[ESRCH] The *pid* argument does not refer to an existing process.

TRL The *posix_trace_create_withlog*( ) function shall fail if:

[EBADF] The *file_desc* argument is not a valid file descriptor open for writing.

[EINVAL] The *file_desc* argument refers to a file with a file type that does not support the log policy associated with the trace log.

[ENOSPC] No space left on device. The device corresponding to the argument *file_desc* does not contain the space required to create this trace log.

TRL The *posix_trace_flush*( ) and *posix_trace_shutdown*( ) functions shall fail if:

[EINVAL] The value of the *trid* argument does not correspond to an active trace stream with log.

[EFBIG] The trace log file has attempted to exceed an implementation-defined maximum file size.

[ENOSPC] No space left on device.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_create*( ), *posix_trace_create_withlog*( ), *posix_trace_flush*( ), and *posix_trace_shutdown*( ) functions may be removed in a future version.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

Issue 7

These functions are marked obsolescent.

SD5-XSH-ERN-154 is applied, updating the DESCRIPTION to remove the *posix_trace_trygetnext_event*( ) function from the list of functions that use the *trid* argument.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0441 [358] is applied.

NAME

posix_trace_event, posix_trace_eventid_open ‡ trace functions for instrumenting application code (**TRACING**)

SYNOPSIS

OB TRC

```
#include <sys/types.h>
#include <trace.h>

void posix_trace_event(trace_event_id_t event_id,
    const void *restrict data_ptr, size_t data_len);
int posix_trace_eventid_open(const char *restrict event_name,
    trace_event_id_t *restrict event_id);
```

DESCRIPTION

The *posix_trace_event*( ) function shall record the *event_id* and the user data pointed to by *data_ptr* in the trace stream into which the calling process is being traced and in which *event_id* is not filtered out. If the total size of the user trace event data represented by *data_len* is not greater than the declared maximum size for user trace event data, then the *truncation-status* attribute of the trace event recorded is POSIX_TRACE_NOT_TRUNCATED. Otherwise, the user trace event data is truncated to this declared maximum size and the *truncation-status* attribute of the trace event recorded is POSIX_TRACE_TRUNCATED_RECORD.

If there is no trace stream created for the process or if the created trace stream is not running, or if the trace event specified by *event_id* is filtered out in the trace stream, the *posix_trace_event*( ) function shall have no effect.

The *posix_trace_eventid_open*( ) function shall associate a user trace event name with a trace event type identifier for the calling process. The trace event name is the string pointed to by the argument *event_name*. It shall have a maximum of {TRACE_EVENT_NAME_MAX} characters (which has the minimum value {_POSIX_TRACE_EVENT_NAME_MAX}). The number of user trace event type identifiers that can be defined for any given process is limited by the maximum value {TRACE_USER_EVENT_MAX}, which has the minimum value {POSIX_TRACE_USER_EVENT_MAX}.

If the Trace Inherit option is not supported, the *posix_trace_eventid_open*( ) function shall associate the user trace event name pointed to by the *event_name* argument with a trace event type identifier that is unique for the traced process, and is returned in the variable pointed to by the *event_id* argument. If the user trace event name has already been mapped for the traced process, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined POSIX_TRACE_UNNAMED_USEREVENT (see Table 2-7, on page 546) user trace event shall be returned.

TRI

If the Trace Inherit option is supported, the *posix_trace_eventid_open*( ) function shall associate the user trace event name pointed to by the *event_name* argument with a trace event type identifier that is unique for all the processes being traced in this same trace stream, and is returned in the variable pointed to by the *event_id* argument. If the user trace event name has already been mapped for the traced processes, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined POSIX_TRACE_UNNAMED_USEREVENT (Table 2-7, on page 546) user trace event shall be returned.

Note: The above procedure, together with the fact that multiple processes can only be traced into the same trace stream by inheritance, ensure that all the processes that are traced into a trace stream have the same mapping of trace event names to trace event type identifiers.

If there is no trace stream created, the *posix_trace_eventid_open*( ) function shall store this information for future trace streams created for this process.

RETURN VALUE

No return value is defined for the *posix_trace_event*( ) function.

Upon successful completion, the *posix_trace_eventid_open*( ) function shall return a value of zero. Otherwise, it shall return the corresponding error number. The *posix_trace_eventid_open*( ) function stores the trace event type identifier value in the object pointed to by *event_id*, if successful.

ERRORS

The *posix_trace_eventid_open*( ) function shall fail if:

[ENAMETOOLONG]
The size of the name pointed to by the *event_name* argument was longer than the implementation-defined value {TRACE_EVENT_NAME_MAX}.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_event*( ) and *posix_trace_eventid_open*( ) functions may be removed in a future version.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

IEEE PASC Interpretation 1003.1 #123 is applied.

IEEE PASC Interpretation 1003.1 #127 is applied, correcting some editorial errors in the names of the *posix_trace_eventid_open*( ) function and the *event_id* argument.

Issue 7

The *posix_trace_event*( ) and *posix_trace_eventid_open*( ) functions are marked obsolescent.

NAME

posix_trace_eventid_equal, posix_trace_eventid_get_name, posix_trace_trid_eventid_open ‡' manipulate the trace event type identifier (**TRACING**)

SYNOPSIS

OB TRC
```
#include <trace.h>

int posix_trace_eventid_equal(trace_id_t trid, trace_event_id_t event1,
    trace_event_id_t event2);
int posix_trace_eventid_get_name(trace_id_t trid,
    trace_event_id_t event, char *event_name);
```
TEF
```
int posix_trace_trid_eventid_open(trace_id_t trid,
    const char *restrict event_name,
    trace_event_id_t *restrict event);
```

DESCRIPTION

The *posix_trace_eventid_equal*( ) function shall compare the trace event type identifiers *event1* and *event2* from the same trace stream or the same trace log identified by the *trid* argument. If the trace event type identifiers *event1* and *event2* are from different trace streams, the return value shall be unspecified.

The *posix_trace_eventid_get_name*( ) function shall return, in the argument pointed to by *event_name*, the trace event name associated with the trace event type identifier identified by the argument *event*, for the trace stream or for the trace log identified by the *trid* argument. The name of the trace event shall have a maximum of {TRACE_EVENT_NAME_MAX} characters (which has the minimum value {_POSIX_TRACE_EVENT_NAME_MAX}). Successive calls to this function with the same trace event type identifier and the same trace stream identifier shall return the same event name.

TEF The *posix_trace_trid_eventid_open*( ) function shall associate a user trace event name with a trace event type identifier for a given trace stream. The trace stream is identified by the *trid* argument, and it shall be an active trace stream. The trace event name is the string pointed to by the argument *event_name*. It shall have a maximum of {TRACE_EVENT_NAME_MAX} characters (which has the minimum value {_POSIX_TRACE_EVENT_NAME_MAX}). The number of user trace event type identifiers that can be defined for any given process is limited by the maximum value {TRACE_USER_EVENT_MAX}, which has the minimum value {_POSIX_TRACE_USER_EVENT_MAX}.

If the Trace Inherit option is not supported, the *posix_trace_trid_eventid_open*( ) function shall associate the user trace event name pointed to by the *event_name* argument with a trace event type identifier that is unique for the process being traced in the trace stream identified by the *trid* argument, and is returned in the variable pointed to by the *event* argument. If the user trace event name has already been mapped for the traced process, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined POSIX_TRACE_UNNAMED_USEREVENT (see Table 2-7, on page 546) user trace event shall be returned.

TEF TRI If the Trace Inherit option is supported, the *posix_trace_trid_eventid_open*( ) function shall associate the user trace event name pointed to by the *event_name* argument with a trace event type identifier that is unique for all the processes being traced in the trace stream identified by the *trid* argument, and is returned in the variable pointed to by the *event* argument. If the user trace event name has already been mapped for the traced processes, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined

50015 POSIX_TRACE_UNNAMED_USEREVENT (see Table 2-7, on page 546) user trace event shall be
50016 returned.

50017 **RETURN VALUE**

50018 TEF Upon successful completion, the *posix_trace_eventid_get_name*( ) and
50019 *posix_trace_trid_eventid_open*( ) functions shall return a value of zero. Otherwise, they shall return
50020 the corresponding error number.

50021 The *posix_trace_eventid_equal*( ) function shall return a non-zero value if *event1* and *event2* are
50022 equal; otherwise, a value of zero shall be returned. No errors are defined. If either *event1* or
50023 *event2* are not valid trace event type identifiers for the trace stream specified by *trid* or if the *trid*
50024 is invalid, the behavior shall be unspecified.

50025 The *posix_trace_eventid_get_name*( ) function stores the trace event name value in the object
50026 pointed to by *event_name*, if successful.

50027 TEF The *posix_trace_trid_eventid_open*( ) function stores the trace event type identifier value in the
50028 object pointed to by *event*, if successful.

50029 **ERRORS**

50030 TEF The *posix_trace_eventid_get_name*( ) and *posix_trace_trid_eventid_open*( ) functions shall fail if:

50031 [EINVAL] The *trid* argument was not a valid trace stream identifier.

50032 TEF The *posix_trace_trid_eventid_open*( ) function shall fail if:

50033 TEF [ENAMETOOLONG]
50034 The size of the name pointed to by the *event_name* argument was longer than
50035 the implementation-defined value {TRACE_EVENT_NAME_MAX}.

50036 The *posix_trace_eventid_get_name*( ) function shall fail if:

50037 [EINVAL] The trace event type identifier *event* was not associated with any name.

50038 **EXAMPLES**

50039 None.

50040 **APPLICATION USAGE**

50041 None.

50042 **RATIONALE**

50043 None.

50044 **FUTURE DIRECTIONS**

50045 The *posix_trace_eventid_equal*( ), *posix_trace_eventid_get_name*( ), and
50046 *posix_trace_trid_eventid_open*( ) functions may be removed in a future version.

50050 **CHANGE HISTORY**

50051 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

50052 IEEE PASC Interpretations 1003.1 #123 and #129 are applied.

50053 **Issue 7**

50054 These functions are marked obsolescent.

50055 **NAME**

50056 posix_trace_eventid_open — trace functions for instrumenting application code (**TRACING**)

50057 **SYNOPSIS**

50058 OB TRC
```
#include <sys/types.h>
#include <trace.h>

int posix_trace_eventid_open(const char *restrict event_name,
    trace_event_id_t *restrict event_id);
```

50062 **DESCRIPTION**

50063 Refer to *posix_trace_event( )*.

NAME

posix_trace_eventset_add, posix_trace_eventset_del, posix_trace_eventset_empty, posix_trace_eventset_fill, posix_trace_eventset_ismember — manipulate trace event type sets (**TRACING**)

SYNOPSIS

OB TRC
TEF

```
#include <trace.h>

int posix_trace_eventset_add(trace_event_id_t event_id,
    trace_event_set_t *set);
int posix_trace_eventset_del(trace_event_id_t event_id,
    trace_event_set_t *set);
int posix_trace_eventset_empty(trace_event_set_t *set);
int posix_trace_eventset_fill(trace_event_set_t *set, int what);
int posix_trace_eventset_ismember(trace_event_id_t event_id,
    const trace_event_set_t *restrict set, int *restrict ismember);
```

DESCRIPTION

These primitives manipulate sets of trace event types. They operate on data objects addressable by the application, not on the current trace event filter of any trace stream.

The *posix_trace_eventset_add*( ) and *posix_trace_eventset_del*( ) functions, respectively, shall add or delete the individual trace event type specified by the value of the argument *event_id* to or from the trace event type set pointed to by the argument *set*. Adding a trace event type already in the set or deleting a trace event type not in the set shall not be considered an error.

The *posix_trace_eventset_empty*( ) function shall initialize the trace event type set pointed to by the *set* argument such that all trace event types defined, both system and user, shall be excluded from the set.

The *posix_trace_eventset_fill*( ) function shall initialize the trace event type set pointed to by the argument *set*, such that the set of trace event types defined by the argument *what* shall be included in the set. The value of the argument *what* shall consist of one of the following values, as defined in the **<trace.h>** header:

POSIX_TRACE_WOPID_EVENTS
: All the process-independent implementation-defined system trace event types are included in the set.

POSIX_TRACE_SYSTEM_EVENTS
: All the implementation-defined system trace event types are included in the set, as are those defined in POSIX.1-2017.

POSIX_TRACE_ALL_EVENTS
: All trace event types defined, both system and user, are included in the set.

Applications shall call either *posix_trace_eventset_empty*( ) or *posix_trace_eventset_fill*( ) at least once for each object of type **trace_event_set_t** prior to any other use of that object. If such an object is not initialized in this way, but is nonetheless supplied as an argument to any of the *posix_trace_eventset_add*( ), *posix_trace_eventset_del*( ), or *posix_trace_eventset_ismember*( ) functions, the results are undefined.

The *posix_trace_eventset_ismember*( ) function shall test whether the trace event type specified by the value of the argument *event_id* is a member of the set pointed to by the argument *set*. The value returned in the object pointed to by *ismember* argument is zero if the trace event type identifier is not a member of the set and a value different from zero if it is a member of the set.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

ERRORS

These functions may fail if:

[EINVAL] The value of one of the arguments is invalid.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_eventset_add*( ), *posix_trace_eventset_del*( ), *posix_trace_eventset_empty*( ), *posix_trace_eventset_fill*( ), and *posix_trace_eventset_ismember*( ) functions may be removed in a future version.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

Issue 7

The *posix_trace_eventset_add*( ), *posix_trace_eventset_del*( ), *posix_trace_eventset_empty*( ), *posix_trace_eventset_fill*( ), and *posix_trace_eventset_ismember*( ) functions are marked obsolescent.

NAME

posix_trace_eventtypelist_getnext_id, posix_trace_eventtypelist_rewind — iterate over a mapping of trace event types (**TRACING**)

SYNOPSIS

OB TRC

```
#include <trace.h>

int posix_trace_eventtypelist_getnext_id(trace_id_t trid,
    trace_event_id_t *restrict event, int *restrict unavailable);
int posix_trace_eventtypelist_rewind(trace_id_t trid);
```

DESCRIPTION

The first time *posix_trace_eventtypelist_getnext_id*( ) is called, the function shall return in the variable pointed to by *event* the first trace event type identifier of the list of trace events of the trace stream identified by the *trid* argument. Successive calls to *posix_trace_eventtypelist_getnext_id*( ) return in the variable pointed to by *event* the next trace event type identifier in that same list. Each time a trace event type identifier is successfully written into the variable pointed to by the *event* argument, the variable pointed to by the *unavailable* argument shall be set to zero. When no more trace event type identifiers are available, and so none is returned, the variable pointed to by the *unavailable* argument shall be set to a value different from zero.

The *posix_trace_eventtypelist_rewind*( ) function shall reset the next trace event type identifier to be read to the first trace event type identifier from the list of trace events used in the trace stream identified by *trid*.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

The *posix_trace_eventtypelist_getnext_id*( ) function stores the trace event type identifier value in the object pointed to by *event*, if successful.

ERRORS

These functions shall fail if:

[EINVAL] The *trid* argument was not a valid trace stream identifier.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_eventtypelist_getnext_id*( ) and *posix_trace_eventtypelist_rewind*( ) functions may be removed in a future version.

50174 **CHANGE HISTORY**

50175 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

50176 IEEE PASC Interpretations 1003.1 #123 and #129 are applied.

50177 **Issue 7**

50178 The *posix_trace_eventtypelist_getnext_id*( ) and *posix_trace_eventtypelist_rewind*( ) functions are
50179 marked obsolescent.

NAME

posix_trace_flush — trace stream flush from a process (**TRACING**)

SYNOPSIS

OB TRC
```
#include <sys/types.h>
#include <trace.h>
```

TRL
```
int posix_trace_flush(trace_id_t trid);
```

DESCRIPTION

Refer to *posix_trace_create( )*.

NAME

posix_trace_get_attr, posix_trace_get_status ‡’ etrieve the trace attributes or trace status (**TRACING**)

SYNOPSIS

OB TRC
```
#include <trace.h>

int posix_trace_get_attr(trace_id_t trid, trace_attr_t *attr);
int posix_trace_get_status(trace_id_t trid,
    struct posix_trace_status_info *statusinfo);
```

DESCRIPTION

The *posix_trace_get_attr*( ) function shall copy the attributes of the active trace stream identified TRL by *trid* into the object pointed to by the *attr* argument. If the Trace Log option is supported, *trid* may represent a pre-recorded trace log.

The *posix_trace_get_status*( ) function shall return, in the structure pointed to by the *statusinfo* argument, the current trace status for the trace stream identified by the *trid* argument. These status values returned in the structure pointed to by *statusinfo* shall have been appropriately TRL read to ensure that the returned values are consistent. If the Trace Log option is supported and the *trid* argument refers to a pre-recorded trace stream, the status shall be the status of the completed trace stream.

Each time the *posix_trace_get_status*( ) function is used, the overrun status of the trace stream TRL shall be reset to POSIX_TRACE_NO_OVERRUN immediately after the call completes. If the Trace Log option is supported, the *posix_trace_get_status*( ) function shall behave the same as when the option is not supported except for the following differences:

- If the *trid* argument refers to a trace stream with log, each time the *posix_trace_get_status*( ) function is used, the log overrun status of the trace stream shall be reset to POSIX_TRACE_NO_OVERRUN and the *flush_error* status shall be reset to zero immediately after the call completes.
- If the *trid* argument refers to a pre-recorded trace stream, the status returned shall be the status of the completed trace stream and the status values of the trace stream shall not be reset.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

The *posix_trace_get_attr*( ) function stores the trace attributes in the object pointed to by *attr*, if successful.

The *posix_trace_get_status*( ) function stores the trace status in the object pointed to by *statusinfo*, if successful.

ERRORS

These functions shall fail if:

[EINVAL] The trace stream argument *trid* does not correspond to a valid active trace stream or a valid trace log.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_get_attr*( ) and *posix_trace_get_status*( ) functions may be removed in a future version.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

IEEE PASC Interpretation 1003.1 #123 is applied.

Issue 7

The *posix_trace_get_attr*( ) and *posix_trace_get_status*( ) functions are marked obsolescent.

NAME

posix_trace_get_filter, posix_trace_set_filter — retrieve and set the filter of an initialized trace stream (**TRACING**)

SYNOPSIS

OB TRC
TEF

```
#include <trace.h>

int posix_trace_get_filter(trace_id_t trid, trace_event_set_t *set);
int posix_trace_set_filter(trace_id_t trid,
    const trace_event_set_t *set, int how);
```

DESCRIPTION

The *posix_trace_get_filter*( ) function shall retrieve, into the argument pointed to by *set*, the actual trace event filter from the trace stream specified by *trid*.

The *posix_trace_set_filter*( ) function shall change the set of filtered trace event types after a trace stream identified by the *trid* argument is created. This function may be called prior to starting the trace stream, or while the trace stream is active. By default, if no call is made to *posix_trace_set_filter*( ), all trace events shall be recorded (that is, none of the trace event types are filtered out).

If this function is called while the trace is in progress, a special system trace event, POSIX_TRACE_FILTER, shall be recorded in the trace indicating both the old and the new sets of filtered trace event types (see Table 2-4 (on page 544) and Table 2-6, on page 545).

If the *posix_trace_set_filter*( ) function is interrupted by a signal, an error shall be returned and the filter shall not be changed. In this case, the state of the trace stream shall not be changed.

The value of the argument *how* indicates the manner in which the set is to be changed and shall have one of the following values, as defined in the **<trace.h>** header:

POSIX_TRACE_SET_EVENTSET
: The resulting set of trace event types to be filtered shall be the trace event type set pointed to by the argument *set*.

POSIX_TRACE_ADD_EVENTSET
: The resulting set of trace event types to be filtered shall be the union of the current set and the trace event type set pointed to by the argument *set*.

POSIX_TRACE_SUB_EVENTSET
: The resulting set of trace event types to be filtered shall be all trace event types in the current set that are not in the set pointed to by the argument *set*; that is, remove each element of the specified set from the current filter.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

The *posix_trace_get_filter*( ) function stores the set of filtered trace event types in *set*, if successful.

ERRORS

These functions shall fail if:

[EINVAL] The value of the *trid* argument does not correspond to an active trace stream or the value of the argument pointed to by *set* is invalid.

[EINTR] The operation was interrupted by a signal.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_get_filter*( ) and *posix_trace_set_filter*( ) functions may be removed in a future version.

NAME

posix_trace_get_status — retrieve the trace status (**TRACING**)

SYNOPSIS

OB TRC

```
#include <trace.h>

int posix_trace_get_status(trace_id_t trid,
    struct posix_trace_status_info *statusinfo);
```

DESCRIPTION

Refer to *posix_trace_get_attr( )*.

NAME

posix_trace_getnext_event, posix_trace_timedgetnext_event, posix_trace_trygetnext_event ‡' retrieve a trace event (**TRACING**)

SYNOPSIS

OB TRC
```
#include <sys/types.h>
#include <trace.h>

int posix_trace_getnext_event(trace_id_t trid,
    struct posix_trace_event_info *restrict event,
    void *restrict data, size_t num_bytes,
    size_t *restrict data_len, int *restrict unavailable);
int posix_trace_timedgetnext_event(trace_id_t trid,
    struct posix_trace_event_info *restrict event,
    void *restrict data, size_t num_bytes,
    size_t *restrict data_len, int *restrict unavailable,
    const struct timespec *restrict abstime);
int posix_trace_trygetnext_event(trace_id_t trid,
    struct posix_trace_event_info *restrict event,
    void *restrict data, size_t num_bytes,
    size_t *restrict data_len, int *restrict unavailable);
```

DESCRIPTION

The *posix_trace_getnext_event*( ) function shall report a recorded trace event either from an active trace stream without log TRL or a pre-recorded trace stream identified by the *trid* argument. The *posix_trace_trygetnext_event*( ) function shall report a recorded trace event from an active trace stream without log identified by the *trid* argument.

The trace event information associated with the recorded trace event shall be copied by the function into the structure pointed to by the argument *event* and the data associated with the trace event shall be copied into the buffer pointed to by the *data* argument.

The *posix_trace_getnext_event*( ) function shall block if the *trid* argument identifies an active trace stream and there is currently no trace event ready to be retrieved. When returning, if a recorded trace event was reported, the variable pointed to by the *unavailable* argument shall be set to zero. Otherwise, the variable pointed to by the *unavailable* argument shall be set to a value different from zero.

The *posix_trace_timedgetnext_event*( ) function shall attempt to get another trace event from an active trace stream without log, as in the *posix_trace_getnext_event*( ) function. However, if no trace event is available from the trace stream, the implied wait shall be terminated when the timeout specified by the argument *abstime* expires, and the function shall return the error [ETIMEDOUT].

The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the clock upon which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the clock on which it is based. The **timespec** data type is defined in the **<time.h>** header.

Under no circumstance shall the function fail with a timeout if a trace event is immediately available from the trace stream. The validity of the *abstime* argument need not be checked if a trace event is immediately available from the trace stream.

The behavior of this function for a pre-recorded trace stream is unspecified.

TRL The *posix_trace_trygetnext_event*( ) function shall not block. This function shall return an error if the *trid* argument identifies a pre-recorded trace stream. If a recorded trace event was reported, the variable pointed to by the *unavailable* argument shall be set to zero. Otherwise, if no trace event was reported, the variable pointed to by the *unavailable* argument shall be set to a value different from zero.

The argument *num_bytes* shall be the size of the buffer pointed to by the *data* argument. The argument *data_len* reports to the application the length in bytes of the data record just transferred. If *num_bytes* is greater than or equal to the size of the data associated with the trace event pointed to by the *event* argument, all the recorded data shall be transferred. In this case, the *truncation-status* member of the trace event structure shall be either POSIX_TRACE_NOT_TRUNCATED, if the trace event data was recorded without truncation while tracing, or POSIX_TRACE_TRUNCATED_RECORD, if the trace event data was truncated when it was recorded. If the *num_bytes* argument is less than the length of recorded trace event data, the data transferred shall be truncated to a length of *num_bytes*, the value stored in the variable pointed to by *data_len* shall be equal to *num_bytes*, and the *truncation-status* member of the *event* structure argument shall be set to POSIX_TRACE_TRUNCATED_READ (see the **posix_trace_event_info** structure defined in **<trace.h>**).

The report of a trace event shall be sequential starting from the oldest recorded trace event. Trace events shall be reported in the order in which they were generated, up to an implementation-defined time resolution that causes the ordering of trace events occurring very close to each other to be unknown. Once reported, a trace event cannot be reported again from an active trace stream. Once a trace event is reported from an active trace stream without log, the trace stream shall make the resources associated with that trace event available to record future generated trace events.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

If successful, these functions store:

The recorded trace event in the object pointed to by *event*

The trace event information associated with the recorded trace event in the object pointed to by *data*

The length of this trace event information in the object pointed to by *data_len*

The value of zero in the object pointed to by *unavailable*

ERRORS

These functions shall fail if:

[EINVAL] The trace stream identifier argument *trid* is invalid.

The *posix_trace_getnext_event*( ) and *posix_trace_timedgetnext_event*( ) functions shall fail if:

[EINTR] The operation was interrupted by a signal, and so the call had no effect.

The *posix_trace_trygetnext_event*( ) function shall fail if:

[EINVAL] The trace stream identifier argument *trid* does not correspond to an active trace stream.

The *posix_trace_timedgetnext_event*( ) function shall fail if:

[EINVAL] There is no trace event immediately available from the trace stream, and the *timeout* argument is invalid.

[ETIMEDOUT] No trace event was available from the trace stream before the specified timeout *timeout* expired.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

These functions may be removed in a future version.

NAME

posix_trace_shutdown — trace stream shutdown from a process (**TRACING**)

SYNOPSIS

OB TRC

```
#include <sys/types.h>
#include <trace.h>

int posix_trace_shutdown(trace_id_t trid);
```

DESCRIPTION

Refer to *posix_trace_create( )*.

50447 **NAME**

50448 posix_trace_start, posix_trace_stop ‡’trace start and stop (**TRACING**)

50449 **SYNOPSIS**

50450 OB TRC
```
#include <trace.h>

int posix_trace_start(trace_id_t trid);
int posix_trace_stop (trace_id_t trid);
```

50453 **DESCRIPTION**

50454 The *posix_trace_start*( ) and *posix_trace_stop*( ) functions, respectively, shall start and stop the trace
50455 stream identified by the argument *trid*.

50456 The effect of calling the *posix_trace_start*( ) function shall be recorded in the trace stream as the
50457 POSIX_TRACE_START system trace event and the status of the trace stream shall become
50458 POSIX_TRACE_RUNNING. If the trace stream is in progress when this function is called, the
50459 POSIX_TRACE_START system trace event shall not be recorded and the trace stream shall
50460 continue to run. If the trace stream is full, the POSIX_TRACE_START system trace event shall
50461 not be recorded and the status of the trace stream shall not be changed.

50462 The effect of calling the *posix_trace_stop*( ) function shall be recorded in the trace stream as the
50463 POSIX_TRACE_STOP system trace event and the status of the trace stream shall become
50464 POSIX_TRACE_SUSPENDED. If the trace stream is suspended when this function is called, the
50465 POSIX_TRACE_STOP system trace event shall not be recorded and the trace stream shall remain
50466 suspended. If the trace stream is full, the POSIX_TRACE_STOP system trace event shall not be
50467 recorded and the status of the trace stream shall not be changed.

50468 **RETURN VALUE**

50469 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
50470 return the corresponding error number.

50471 **ERRORS**

50472 These functions shall fail if:

50473 [EINVAL] The value of the argument *trid* does not correspond to an active trace stream
50474 and thus no trace stream was started or stopped.

50475 [EINTR] The operation was interrupted by a signal and thus the trace stream was not
50476 necessarily started or stopped.

DESCRIPTION

Refer to *posix_trace_getnext_event( )*.

NAME

posix_trace_trid_eventid_open ‡ open a trace event type identifier (**TRACING**)

SYNOPSIS

OB TRC
```
#include <trace.h>
```

TEF
```
int posix_trace_trid_eventid_open(trace_id_t trid,
    const char *restrict event_name,
    trace_event_id_t *restrict event);
```

DESCRIPTION

Refer to *posix_trace_eventid_equal( )*.

NAME

posix_trace_trygetnext_event — retrieve a trace event (**TRACING**)

SYNOPSIS

OB TRC

```
#include <sys/types.h>
#include <trace.h>

int posix_trace_trygetnext_event(trace_id_t trid,
    struct posix_trace_event_info *restrict event,
    void *restrict data, size_t num_bytes,
    size_t *restrict data_len, int *restrict unavailable);
```

DESCRIPTION

Refer to *posix_trace_getnext_event( )*.

NAME

posix_typed_mem_get_info ‡'query typed memory information (**ADVANCED REALTIME**)

SYNOPSIS

TYM
```
#include <sys/mman.h>

int posix_typed_mem_get_info(int fildes,
    struct posix_typed_mem_info *info);
```

DESCRIPTION

The *posix_typed_mem_get_info*( ) function shall return, in the *posix_tmi_length* field of the **posix_typed_mem_info** structure pointed to by *info*, the maximum length which may be successfully allocated by the typed memory object designated by *fildes*. This maximum length shall take into account the flag POSIX_TYPED_MEM_ALLOCATE or POSIX_TYPED_MEM_ALLOCATE_CONTIG specified when the typed memory object represented by *fildes* was opened. The maximum length is dynamic; therefore, the value returned is valid only while the current mapping of the corresponding typed memory pool remains unchanged.

If *fildes* represents a typed memory object opened with neither the POSIX_TYPED_MEM_ALLOCATE flag nor the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag specified, the returned value of *info->posix_tmi_length* is unspecified.

The *posix_typed_mem_get_info*( ) function may return additional implementation-defined information in other fields of the **posix_typed_mem_info** structure pointed to by *info*.

If the memory object specified by *fildes* is not a typed memory object, then the behavior of this function is undefined.

RETURN VALUE

Upon successful completion, the *posix_typed_mem_get_info*( ) function shall return zero; otherwise, the corresponding error status value shall be returned.

ERRORS

The *posix_typed_mem_get_info*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid open file descriptor.

[ENODEV] The *fildes* argument is not connected to a memory object supported by this function.

This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

An application that needs to allocate a block of typed memory with length dependent upon the amount of memory currently available must either query the typed memory object to obtain the amount available, or repeatedly invoke *mmap*( ) attempting to guess an appropriate length. While the latter method is existing practice with *malloc*( ), it is awkward and imprecise. The *posix_typed_mem_get_info*( ) function allows an application to immediately determine available memory. This is particularly important for typed memory objects that may in some cases be scarce resources. Note that when a typed memory pool is a shared resource, some form of mutual-exclusion or synchronization may be required while typed memory is being queried and

allocated to prevent race conditions.

The existing *fstat*( ) function is not suitable for this purpose. We realize that implementations may wish to provide other attributes of typed memory objects (for example, alignment requirements, page size, and so on). The *fstat*( ) function returns a structure which is not extensible and, furthermore, contains substantial information that is inappropriate for typed memory objects.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

NAME

posix_typed_mem_open ‡’open a typed memory object (**ADVANCED REALTIME**)

SYNOPSIS

TYM
```
#include <sys/mman.h>

int posix_typed_mem_open(const char *name, int oflag, int tflag);
```

DESCRIPTION

The *posix_typed_mem_open*( ) function shall establish a connection between the typed memory object specified by the string pointed to by *name* and a file descriptor. It shall create an open file description that refers to the typed memory object and a file descriptor that refers to that open file description. The file descriptor shall be allocated as described in Section 2.14 (on page 549) and can be used by other functions to refer to that typed memory object. It is unspecified whether the name appears in the file system and is visible to other functions that take pathnames as arguments. The *name* argument conforms to the construction rules for a pathname, except that the interpretation of <slash> characters other than the leading <slash> character in *name* is implementation-defined, and that the length limits for the *name* argument are implementation-defined and need not be the same as the pathname limits {PATH_MAX} and {NAME_MAX}. If *name* begins with the <slash> character, then processes calling *posix_typed_mem_open*( ) with the same value of *name* shall refer to the same typed memory object. If *name* does not begin with the <slash> character, the effect is implementation-defined.

Each typed memory object supported in a system shall be identified by a name which specifies not only its associated typed memory pool, but also the path or port by which it is accessed. That is, the same typed memory pool accessed via several different ports shall have several different corresponding names. The binding between names and typed memory objects is established in an implementation-defined manner. Unlike shared memory objects, there is no way within POSIX.1-2017 for a program to create a typed memory object.

The value of *tflag* shall determine how the typed memory object behaves when subsequently mapped by calls to *mmap*( ). At most, one of the following flags defined in **<sys/mman.h>** may be specified:

POSIX_TYPED_MEM_ALLOCATE
: Allocate on *mmap*( ).

POSIX_TYPED_MEM_ALLOCATE_CONTIG
: Allocate contiguously on *mmap*( ).

POSIX_TYPED_MEM_MAP_ALLOCATABLE
: Map on *mmap*( ), without affecting allocatability.

If *tflag* has the flag POSIX_TYPED_MEM_ALLOCATE specified, any subsequent call to *mmap*( ) using the returned file descriptor shall result in allocation and mapping of typed memory from the specified typed memory pool. The allocated memory may be a contiguous previously unallocated area of the typed memory pool or several non-contiguous previously unallocated areas (mapped to a contiguous portion of the process address space). If *tflag* has the flag POSIX_TYPED_MEM_ALLOCATE_CONTIG specified, any subsequent call to *mmap*( ) using the returned file descriptor shall result in allocation and mapping of a single contiguous previously unallocated area of the typed memory pool (also mapped to a contiguous portion of the process address space). If *tflag* has none of the flags POSIX_TYPED_MEM_ALLOCATE or POSIX_TYPED_MEM_ALLOCATE_CONTIG specified, any subsequent call to *mmap*( ) using the returned file descriptor shall map an application-chosen area from the specified typed memory pool such that this mapped area becomes unavailable for allocation until unmapped by all processes. If *tflag* has the flag POSIX_TYPED_MEM_MAP_ALLOCATABLE specified, any

subsequent call to *mmap*( ) using the returned file descriptor shall map an application-chosen area from the specified typed memory pool without an effect on the availability of that area for allocation; that is, mapping such an object leaves each byte of the mapped area unallocated if it was unallocated prior to the mapping or allocated if it was allocated prior to the mapping. Appropriate privileges to specify the POSIX_TYPED_MEM_MAP_ALLOCATABLE flag are implementation-defined.

If successful, *posix_typed_mem_open*( ) shall return a file descriptor for the typed memory object. The open file description is new, and therefore the file descriptor shall not share it with any other processes. It is unspecified whether the file offset is set. The FD_CLOEXEC file descriptor flag associated with the new file descriptor shall be cleared.

The behavior of *msync*( ), *ftruncate*( ), and all file operations other than *mmap*( ), *posix_mem_offset*( ), *posix_typed_mem_get_info*( ), *fstat*( ), *dup*( ), *dup2*( ), and *close*( ), is unspecified when passed a file descriptor connected to a typed memory object by this function.

The file status flags of the open file description shall be set according to the value of *oflag*. Applications shall specify exactly one of the three access mode values described below and defined in the **<fcntl.h>** header, as the value of *oflag*.

O_RDONLY Open for read access only.

O_WRONLY Open for write access only.

O_RDWR Open for read or write access.

RETURN VALUE

Upon successful completion, the *posix_typed_mem_open*( ) function shall return a non-negative integer representing the file descriptor. Otherwise, it shall return −1 and set *errno* to indicate the error.

ERRORS

The *posix_typed_mem_open*( ) function shall fail if:

[EACCES] The typed memory object exists and the permissions specified by *oflag* are denied.

[EINTR] The *posix_typed_mem_open*( ) operation was interrupted by a signal.

[EINVAL] The flags specified in *tflag* are invalid (more than one of POSIX_TYPED_MEM_ALLOCATE, POSIX_TYPED_MEM_ALLOCATE_CONTIG, or POSIX_TYPED_MEM_MAP_ALLOCATABLE is specified).

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] Too many file descriptors are currently open in the system.

[ENOENT] The named typed memory object does not exist.

[EPERM] The caller lacks appropriate privileges to specify the POSIX_TYPED_MEM_MAP_ALLOCATABLE flag in the *tflag* argument.

The *posix_typed_mem_open*( ) function may fail if:

[ENAMETOOLONG]
The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI systems, or has a pathname component that is longer than

50671 XSI {_POSIX_NAME_MAX} on systems that do not support the XSI option or
50672 longer than {_XOPEN_NAME_MAX} on XSI systems.

NAME

pow, powf, powl ‡'power function

SYNOPSIS

```
#include <math.h>

double pow(double x, double y);
float powf(float x, float y);
long double powl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall compute the value of x raised to the power y, x^y. If x is negative, the application shall ensure that y is an integer value.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the value of x raised to the power y.

MX For finite values of $x < 0$, and finite non-integer values of y, a domain error shall occur and either a NaN (if representable), or an implementation-defined value shall be returned.

If the correct value would cause overflow, a range error shall occur and *pow*( ), *powf*( ), and *powl*( ) shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL, respectively, with the same sign as the correct value of the function.

MXX If the correct value would cause underflow, and is not representable, a range error may occur, and *pow*( ), *powf*( ), and *powl*( ) shall return 0.0, or (if IEC 60559 Floating-Point is not supported) an implementation-defined value no greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

CX For $y < 0$, if x is zero, a pole error may occur and *pow*( ), *powf*( ), and *powl*( ) shall return
MX ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL, respectively. On systems that support the IEC 60559 Floating-Point option, if x is ±0, a pole error shall occur and *pow*( ), *powf*( ), and *powl*( ) shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL, respectively if y is an odd integer, or HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively if y is not an odd integer.

MX If x or y is a NaN, a NaN shall be returned (unless specified elsewhere in this description).

For any value of y (including NaN), if x is +1, 1.0 shall be returned.

For any value of x (including NaN), if y is ±0, 1.0 shall be returned.

For any odd integer value of $y > 0$, if x is ±0, ±0 shall be returned.

For $y > 0$ and not an odd integer, if x is ±0, +0 shall be returned.

If x is –1, and y is ±Inf, 1.0 shall be returned.

For $|x| < 1$, if y is –Inf, +Inf shall be returned.

For $|x| > 1$, if y is –Inf, +0 shall be returned.

For $|x| < 1$, if y is +Inf, +0 shall be returned.

For $|x| > 1$, if y is +Inf, +Inf shall be returned.

For y an odd integer < 0, if x is –Inf, –0 shall be returned.

For $y < 0$ and not an odd integer, if x is –Inf, +0 shall be returned.

For y an odd integer > 0, if x is –Inf, –Inf shall be returned.

For $y > 0$ and not an odd integer, if x is –Inf, +Inf shall be returned.

For $y < 0$, if x is +Inf, +0 shall be returned.

For $y > 0$, if x is +Inf, +Inf shall be returned.

MXX If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions shall fail if:

Domain Error — The value of x is negative and y is a finite non-integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

MX Pole Error — The value of x is zero and y is negative.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised.

Range Error — The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Pole Error — The value of x is zero and y is negative.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised.

Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

The *powf*( ) and *powl*( ) functions are added for alignment with the ISO/IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/42 is applied, correcting the third paragraph in the RETURN VALUE section.

Issue 7

ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #51 (SD5-XSH-ERN-81) is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0443 [68], XSH/TC1-2008/0444 [148], and XSH/TC1-2008/0445 [68] are applied.

NAME

pselect, select — synchronous I/O multiplexing

SYNOPSIS

```
#include <sys/select.h>

int pselect(int nfds, fd_set *restrict readfds,
    fd_set *restrict writefds, fd_set *restrict errorfds,
    const struct timespec *restrict timeout,
    const sigset_t *restrict sigmask);
int select(int nfds, fd_set *restrict readfds,
    fd_set *restrict writefds, fd_set *restrict errorfds,
    struct timeval *restrict timeout);
void FD_CLR(int fd, fd_set *fdset);
int FD_ISSET(int fd, fd_set *fdset);
void FD_SET(int fd, fd_set *fdset);
void FD_ZERO(fd_set *fdset);
```

DESCRIPTION

The *pselect*( ) function shall examine the file descriptor sets whose addresses are passed in the *readfds*, *writefds*, and *errorfds* parameters to see whether some of their descriptors are ready for reading, are ready for writing, or have an exceptional condition pending, respectively.

The *select*( ) function shall be equivalent to the *pselect*( ) function, except as follows:

> For the *select*( ) function, the timeout period is given in seconds and microseconds in an argument of type **struct timeval**, whereas for the *pselect*( ) function the timeout period is given in seconds and nanoseconds in an argument of type **struct timespec**.
>
> The *select*( ) function has no *sigmask* argument; it shall behave as *pselect*( ) does when *sigmask* is a null pointer.
>
> Upon successful completion, the *select*( ) function may modify the object pointed to by the *timeout* argument.

The *pselect*( ) and *select*( ) functions shall support regular files, terminal and pseudo-terminal devices, STREAMS-based files, FIFOs, pipes, and sockets. The behavior of *pselect*( ) and *select*( ) on file descriptors that refer to other types of file is unspecified.

OB XSR

The *nfds* argument specifies the range of descriptors to be tested. The first *nfds* descriptors shall be checked in each set; that is, the descriptors from zero through *nfds*–1 in the descriptor sets shall be examined.

If the *readfds* argument is not a null pointer, it points to an object of type **fd_set** that on input specifies the file descriptors to be checked for being ready to read, and on output indicates which file descriptors are ready to read.

If the *writefds* argument is not a null pointer, it points to an object of type **fd_set** that on input specifies the file descriptors to be checked for being ready to write, and on output indicates which file descriptors are ready to write.

If the *errorfds* argument is not a null pointer, it points to an object of type **fd_set** that on input specifies the file descriptors to be checked for error conditions pending, and on output indicates which file descriptors have error conditions pending.

Upon successful completion, the *pselect*( ) or *select*( ) function shall modify the objects pointed to by the *readfds*, *writefds*, and *errorfds* arguments to indicate which file descriptors are ready for reading, ready for writing, or have an error condition pending, respectively, and shall return the total number of ready descriptors in all the output sets. For each file descriptor less than *nfds*, the

corresponding bit shall be set upon successful completion if it was set on input and the associated condition is true for that file descriptor.

If none of the selected descriptors are ready for the requested operation, the *pselect*( ) or *select*( ) function shall block until at least one of the requested operations becomes ready, until the *timeout* occurs, or until interrupted by a signal. The *timeout* parameter controls how long the *pselect*( ) or *select*( ) function shall take before timing out. If the *timeout* parameter is not a null pointer, it specifies a maximum interval to wait for the selection to complete. If the specified time interval expires without any requested operation becoming ready, the function shall return. If the *timeout* parameter is a null pointer, then the call to *pselect*( ) or *select*( ) shall block indefinitely until at least one descriptor meets the specified criteria. To effect a poll, the *timeout* parameter should not be a null pointer, and should point to a zero-valued **timespec** structure.

The use of a timeout does not affect any pending timers set up by *alarm*( ) or *setitimer*( ).

Implementations may place limitations on the maximum timeout interval supported. All implementations shall support a maximum timeout interval of at least 31 days. If the *timeout* argument specifies a timeout interval greater than the implementation-defined maximum value, the maximum value shall be used as the actual timeout value. Implementations may also place limitations on the granularity of timeout intervals. If the requested timeout interval requires a finer granularity than the implementation supports, the actual timeout interval shall be rounded up to the next supported value.

If *sigmask* is not a null pointer, then the *pselect*( ) function shall replace the signal mask of the caller by the set of signals pointed to by *sigmask* before examining the descriptors, and shall restore the signal mask of the calling thread before returning.

A descriptor shall be considered ready for reading when a call to an input function with O_NONBLOCK clear would not block, whether or not the function would transfer data successfully. (The function might return data, an end-of-file indication, or an error other than one indicating that it is blocked, and in each of these cases the descriptor shall be considered ready for reading.)

A descriptor shall be considered ready for writing when a call to an output function with O_NONBLOCK clear would not block, whether or not the function would transfer data successfully.

If a socket has a pending error, it shall be considered to have an exceptional condition pending. Otherwise, what constitutes an exceptional condition is file type-specific. For a file descriptor for use with a socket, it is protocol-specific except as noted below. For other file types it is implementation-defined. If the operation is meaningless for a particular file type, *pselect*( ) or *select*( ) shall indicate that the descriptor is ready for read or write operations, and shall indicate that the descriptor has no exceptional condition pending.

If a descriptor refers to a socket, the implied input function is the *recvmsg*( ) function with parameters requesting normal and ancillary data, such that the presence of either type shall cause the socket to be marked as readable. The presence of out-of-band data shall be checked if the socket option SO_OOBINLINE has been enabled, as out-of-band data is enqueued with normal data. If the socket is currently listening, then it shall be marked as readable if an incoming connection request has been received, and a call to the *accept*( ) function shall complete without blocking.

If a descriptor refers to a socket, the implied output function is the *sendmsg*( ) function supplying an amount of normal data equal to the current value of the SO_SNDLOWAT option for the socket. If a non-blocking call to the *connect*( ) function has been made for a socket, and the connection attempt has either succeeded or failed leaving a pending error, the socket shall be

marked as writable.

A socket shall be considered to have an exceptional condition pending if a receive operation with O_NONBLOCK clear for the open file description and with the MSG_OOB flag set would return out-of-band data without blocking. (It is protocol-specific whether the MSG_OOB flag would be used to read out-of-band data.) A socket shall also be considered to have an exceptional condition pending if an out-of-band data mark is present in the receive queue. Other circumstances under which a socket may be considered to have an exceptional condition pending are protocol-specific and implementation-defined.

If the *readfds*, *writefds*, and *errorfds* arguments are all null pointers and the *timeout* argument is not a null pointer, the *pselect*( ) or *select*( ) function shall block for the time specified, or until interrupted by a signal. If the *readfds*, *writefds*, and *errorfds* arguments are all null pointers and the *timeout* argument is a null pointer, the *pselect*( ) or *select*( ) function shall block until interrupted by a signal.

File descriptors associated with regular files shall always select true for ready to read, ready to write, and error conditions.

On failure, the objects pointed to by the *readfds*, *writefds*, and *errorfds* arguments shall not be modified. If the timeout interval expires without the specified condition being true for any of the specified file descriptors, the objects pointed to by the *readfds*, *writefds*, and *errorfds* arguments shall have all bits set to 0.

File descriptor masks of type **fd_set** can be initialized and tested with *FD_CLR*( ), *FD_ISSET*( ), *FD_SET*( ), and *FD_ZERO*( ). It is unspecified whether each of these is a macro or a function. If a macro definition is suppressed in order to access an actual function, or a program defines an external identifier with any of these names, the behavior is undefined.

FD_CLR(*fd*, *fdsetp*) shall remove the file descriptor *fd* from the set pointed to by *fdsetp*. If *fd* is not a member of this set, there shall be no effect on the set, nor will an error be returned.

FD_ISSET(*fd*, *fdsetp*) shall evaluate to non-zero if the file descriptor *fd* is a member of the set pointed to by *fdsetp*, and shall evaluate to zero otherwise.

FD_SET(*fd*, *fdsetp*) shall add the file descriptor *fd* to the set pointed to by *fdsetp*. If the file descriptor *fd* is already in this set, there shall be no effect on the set, nor will an error be returned.

FD_ZERO(*fdsetp*) shall initialize the descriptor set pointed to by *fdsetp* to the null set. No error is returned if the set is not empty at the time *FD_ZERO*( ) is invoked.

The behavior of these macros is undefined if the *fd* argument is less than 0 or greater than or equal to FD_SETSIZE, or if *fd* is not a valid file descriptor, or if any of the arguments are expressions with side-effects.

If a thread gets canceled during a *pselect*( ) call, the signal mask in effect when executing the registered cleanup functions is either the original signal mask or the signal mask installed as part of the *pselect*( ) call.

RETURN VALUE

Upon successful completion, the *pselect*( ) and *select*( ) functions shall return the total number of bits set in the bit masks. Otherwise, −1 shall be returned, and *errno* shall be set to indicate the error.

FD_CLR( ), *FD_SET*( ), and *FD_ZERO*( ) do not return a value. *FD_ISSET*( ) shall return a non-zero value if the bit for the file descriptor *fd* is set in the file descriptor set pointed to by *fdset*, and 0 otherwise.

ERRORS

Under the following conditions, *pselect*( ) and *select*( ) shall fail and set *errno* to:

[EBADF] One or more of the file descriptor sets specified a file descriptor that is not a valid open file descriptor.

[EINTR] The function was interrupted while blocked waiting for any of the selected descriptors to become ready and before the timeout interval expired.

If SA_RESTART has been set for the interrupting signal, it is implementation-defined whether the function restarts or returns with [EINTR].

[EINVAL] An invalid timeout interval was specified.

[EINVAL] The *nfds* argument is less than 0 or greater than FD_SETSIZE.

OB XSR [EINVAL] One of the specified file descriptors refers to a STREAM or multiplexer that is linked (directly or indirectly) downstream from a multiplexer.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

In earlier versions of the Single UNIX Specification, the *select*( ) function was defined in the **<sys/time.h>** header. This is now changed to **<sys/select.h>**. The rationale for this change was as follows: the introduction of the *pselect*( ) function included the **<sys/select.h>** header and the **<sys/select.h>** header defines all the related definitions for the *pselect*( ) and *select*( ) functions. Backwards-compatibility to existing XSI implementations is handled by allowing **<sys/time.h>** to include **<sys/select.h>**.

Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers can install an additional cancellation handler which resets the signal mask to the expected value.

```
void cleanup(void *arg)
{
    sigset_t *ss = (sigset_t *) arg;
    pthread_sigmask(SIG_SETMASK, ss, NULL);
}

int call_pselect(int nfds, fd_set *readfds, fd_set *writefds,
    fd_set errorfds, const struct timespec *timeout,
    const sigset_t *sigmask)
{
    sigset_t oldmask;
    int result;
    pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
    pthread_cleanup_push(cleanup, &oldmask);
    result = pselect(nfds, readfds, writefds, errorfds, timeout, sigmask);
    pthread_cleanup_pop(0);
    return result;
}
```

FUTURE DIRECTIONS

None.

XBD **<sys/select.h>**, **<sys/time.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

In the ERRORS section, the text has been changed to indicate that [EINVAL] is returned when *nfds* is less than 0 or greater than FD_SETSIZE. It previously stated less than 0, or greater than or equal to FD_SETSIZE.

Text about *timeout* is moved from the APPLICATION USAGE section to the DESCRIPTION.

Issue 6

The Open Group Corrigendum U026/6 is applied, changing the occurrences of *readfs* and *writefs* in the *select*( ) DESCRIPTION to be *readfds* and *writefds*.

Text referring to sockets is added to the DESCRIPTION.

The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

> These functions are now mandatory.

The *pselect*( ) function is added for alignment with IEEE Std 1003.1g-2000 and additional detail related to sockets semantics is added to the DESCRIPTION.

The *select*( ) function now requires inclusion of **<sys/select.h>**.

The **restrict** keyword is added to the *select*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/70 is applied, updating the DESCRIPTION to reference the signal mask in terms of the calling thread rather than the process.

Issue 7

SD5-XSH-ERN-122 is applied, adding text to the DESCRIPTION for when a thread is canceled during a call to *pselect*( ), and adding example code to the RATIONALE.

Functionality relating to the XSI STREAMS option is marked obsolescent.

Functionality relating to the Threads option is moved to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0446 [372] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0259 [680] is applied.

NAME

psiginfo, psignal ‡ write signal information to standard error

SYNOPSIS

CX
```
#include <signal.h>

void psiginfo(const siginfo_t *pinfo, const char *message);
void psignal(int signum, const char *message);
```

DESCRIPTION

The *psiginfo*( ) and *psignal*( ) functions shall write a language-dependent message associated with a signal number to the standard error stream as follows:

First, if *message* is not a null pointer and is not the empty string, the string pointed to by the *message* argument shall be written, followed by a <colon> and a <space>.

Then the signal description string associated with *signum* or with the signal indicated by *pinfo* shall be written, followed by a <newline>.

For *psiginfo*( ), the application shall ensure that the argument *pinfo* references a valid **siginfo_t** structure. For *psignal*( ), if *signum* is not a valid signal number, the behavior is implementation-defined.

The *psiginfo*( ) and *psignal*( ) functions shall not change the orientation of the standard error stream.

The *psiginfo*( ) and *psignal*( ) functions shall mark for update the last data modification and last file status change timestamps of the file associated with the standard error stream at some time between their successful completion and *exit*( ), *abort*( ), or the completion of *fflush*( ) or *fclose*( ) on *stderr*.

The *psiginfo*( ) and *psignal*( ) functions shall not change the setting of *errno* if successful.

On error, the *psiginfo*( ) and *psignal*( ) functions shall set the error indicator for the stream to which *stderr* points, and shall set *errno* to indicate the error.

Since no value is returned, an application wishing to check for error situations should set *errno* to 0, then call *psiginfo*( ) or *psignal*( ), then check *errno*.

RETURN VALUE

These functions shall not return a value.

ERRORS

Refer to *fputc*( ).

EXAMPLES

None.

APPLICATION USAGE

As an alternative to setting *errno* to zero before the call and checking if it is non-zero afterwards, applications can use *ferror*( ) to detect whether *psiginfo*( ) or *psignal*( ) encountered an error.

An application wishing to use this method to check for error situations should call *clearerr*(*stderr*) before calling *psiginfo*( ) or *psignal*( ), then if *ferror*(*stderr*) returns non-zero, the value of *errno* indicates which error occurred.

RATIONALE

System V historically has *psignal*( ) and *psiginfo*( ) in **<siginfo.h>**. However, the **<siginfo.h>** header is not specified in the Base Definitions volume of POSIX.1-2017, and the type **siginfo_t** is defined in **<signal.h>**.

FUTURE DIRECTIONS

None.

NAME

pthread_atfork — register fork handlers

SYNOPSIS

```
#include <pthread.h>

int pthread_atfork(void (*prepare)(void), void (*parent)(void),
    void (*child)(void));
```

DESCRIPTION

The *pthread_atfork*( ) function shall declare fork handlers to be called before and after *fork*( ), in the context of the thread that called *fork*( ). The *prepare* fork handler shall be called before *fork*( ) processing commences. The *parent* fork handle shall be called after *fork*( ) processing completes in the parent process. The *child* fork handler shall be called after *fork*( ) processing completes in the child process. If no handling is desired at one or more of these three points, the corresponding fork handler address(es) may be set to NULL.

If a *fork*( ) call in a multi-threaded process leads to a *child* fork handler calling any function that is not async-signal-safe, the behavior is undefined.

The order of calls to *pthread_atfork*( ) is significant. The *parent* and *child* fork handlers shall be called in the order in which they were established by calls to *pthread_atfork*( ). The *prepare* fork handlers shall be called in the opposite order.

RETURN VALUE

Upon successful completion, *pthread_atfork*( ) shall return a value of zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_atfork*( ) function shall fail if:

[ENOMEM] Insufficient table space exists to record the fork handler addresses.

The *pthread_atfork*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

The original usage pattern envisaged for *pthread_atfork*( ) was for the *prepare* fork handler to lock mutexes and other locks, and for the *parent* and *child* handlers to unlock them. However, since all of the relevant unlocking functions, except *sem_post*( ), are not async-signal-safe, this usage results in undefined behavior in the child process unless the only such unlocking function it calls is *sem_post*( ).

RATIONALE

There are at least two serious problems with the semantics of *fork*( ) in a multi-threaded program. One problem has to do with state (for example, memory) covered by mutexes. Consider the case where one thread has a mutex locked and the state covered by that mutex is inconsistent while another thread calls *fork*( ). In the child, the mutex is in the locked state (locked by a nonexistent thread and thus can never be unlocked). Having the child simply reinitialize the mutex is unsatisfactory since this approach does not resolve the question about how to correct or otherwise deal with the inconsistent state in the child.

It is suggested that programs that use *fork*( ) call an *exec* function very soon afterwards in the child process, thus resetting all states. In the meantime, only a short list of async-signal-safe library routines are promised to be available.

Unfortunately, this solution does not address the needs of multi-threaded libraries. Application

programs may not be aware that a multi-threaded library is in use, and they feel free to call any number of library routines between the *fork*( ) and *exec* calls, just as they always have. Indeed, they may be extant single-threaded programs and cannot, therefore, be expected to obey new restrictions imposed by the threads library.

On the other hand, the multi-threaded library needs a way to protect its internal state during *fork*( ) in case it is re-entered later in the child process. The problem arises especially in multi-threaded I/O libraries, which are almost sure to be invoked between the *fork*( ) and *exec* calls to effect I/O redirection. The solution may require locking mutex variables during *fork*( ), or it may entail simply resetting the state in the child after the *fork*( ) processing completes.

The *pthread_atfork*( ) function was intended to provide multi-threaded libraries with a means to protect themselves from innocent application programs that call *fork*( ), and to provide multi-threaded application programs with a standard mechanism for protecting themselves from *fork*( ) calls in a library routine or the application itself.

The expected usage was that the prepare handler would acquire all mutex locks and the other two fork handlers would release them.

For example, an application could have supplied a prepare routine that acquires the necessary mutexes the library maintains and supplied child and parent routines that release those mutexes, thus ensuring that the child would have got a consistent snapshot of the state of the library (and that no mutexes would have been left stranded). This is good in theory, but in reality not practical. Each and every mutex and lock in the process must be located and locked. Every component of a program including third-party components must participate and they must agree who is responsible for which mutex or lock. This is especially problematic for mutexes and locks in dynamically allocated memory. All mutexes and locks internal to the implementation must be locked, too. This possibly delays the thread calling *fork*( ) for a long time or even indefinitely since uses of these synchronization objects may not be under control of the application. A final problem to mention here is the problem of locking streams. At least the streams under control of the system (like *stdin*, *stdout*, *stderr*) must be protected by locking the stream with *flockfile*( ). But the application itself could have done that, possibly in the same thread calling *fork*( ). In this case, the process will deadlock.

Alternatively, some libraries might have been able to supply just a *child* routine that reinitializes the mutexes in the library and all associated states to some known value (for example, what it was when the image was originally executed). This approach is not possible, though, because implementations are allowed to fail **_init*( ) and **_destroy*( ) calls for mutexes and locks if the mutex or lock is still locked. In this case, the *child* routine is not able to reinitialize the mutexes and locks.

When *fork*( ) is called, only the calling thread is duplicated in the child process. Synchronization variables remain in the same state in the child as they were in the parent at the time *fork*( ) was called. Thus, for example, mutex locks may be held by threads that no longer exist in the child process, and any associated states may be inconsistent. The intention was that the parent process could have avoided this by explicit code that acquires and releases locks critical to the child via *pthread_atfork*( ). In addition, any critical threads would have needed to be recreated and reinitialized to the proper state in the child (also via *pthread_atfork*( )).

A higher-level package may acquire locks on its own data structures before invoking lower-level packages. Under this scenario, the order specified for fork handler calls allows a simple rule of initialization for avoiding package deadlock: a package initializes all packages on which it depends before it calls the *pthread_atfork*( ) function for itself.

As explained, there is no suitable solution for functionality which requires non-atomic operations to be protected through mutexes and locks. This is why the POSIX.1 standard since

the 1996 release requires that the child process after *fork*( ) in a multi-threaded process only calls async-signal-safe interfaces.

FUTURE DIRECTIONS

The *pthread_atfork*( ) function may be formally deprecated (for example, by shading it OB) in a future version of this standard.

NAME

pthread_attr_destroy, pthread_attr_init — destroy and initialize the thread attributes object

SYNOPSIS

```
#include <pthread.h>

int pthread_attr_destroy(pthread_attr_t *attr);
int pthread_attr_init(pthread_attr_t *attr);
```

DESCRIPTION

The *pthread_attr_destroy*( ) function shall destroy a thread attributes object. An implementation may cause *pthread_attr_destroy*( ) to set *attr* to an implementation-defined invalid value. A destroyed *attr* attributes object can be reinitialized using *pthread_attr_init*( ); the results of otherwise referencing the object after it has been destroyed are undefined.

The *pthread_attr_init*( ) function shall initialize a thread attributes object *attr* with the default value for all of the individual attributes used by a given implementation.

The resulting attributes object (possibly modified by setting individual attribute values) when used by *pthread_create*( ) defines the attributes of the thread created. A single attributes object can be used in multiple simultaneous calls to *pthread_create*( ). Results are undefined if *pthread_attr_init*( ) is called specifying an already initialized *attr* attributes object.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_destroy*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

Upon successful completion, *pthread_attr_destroy*( ) and *pthread_attr_init*( ) shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_init*( ) function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the thread attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to support probable future standardization in these areas without requiring that the function itself be changed.

Attributes objects provide clean isolation of the configurable aspects of threads. For example, ``stack size'' is an important attribute of a thread, but it cannot be expressed portably. When porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects can help by allowing the changes to be isolated in a single place, rather than being spread across every instance of thread creation.

Attributes objects can be used to set up ``classes' of threads with similar attributes; for example, ``threads with large stacks and high priority'' or ``threads with minimal stacks''. These classes can be defined in a single place and then referenced wherever threads need to be created. Changes to ``class'' decisions become straightforward, and detailed analysis of each *pthread_create*( ) call is not required.

The attributes objects are defined as opaque types as an aid to extensibility. If these objects had been specified as structures, adding new attributes would force recompilation of all multi-threaded programs when the attributes objects are extended; this might not be possible if different program components were supplied by different vendors.

Additionally, opaque attributes objects present opportunities for improving performance. Argument validity can be checked once when attributes are set, rather than each time a thread is created. Implementations often need to cache kernel objects that are expensive to create. Opaque attributes objects provide an efficient mechanism to detect when cached objects become invalid due to attribute changes.

Since assignment is not necessarily defined on a given opaque type, implementation-defined default values cannot be defined in a portable way. The solution to this problem is to allow attributes objects to be initialized dynamically by attributes object initialization functions, so that default values can be supplied automatically by the implementation.

The following proposal was provided as a suggested alternative to the supplied attributes:

1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to the initialization routines (*pthread_create*( ), *pthread_mutex_init*( ), *pthread_cond_init*( )). The parameter containing the flags should be an opaque type for extensibility. If no flags are set in the parameter, then the objects are created with default characteristics. An implementation may specify implementation-defined flag values and associated behavior.

2. If further specialization of mutexes and condition variables is necessary, implementations may specify additional procedures that operate on the **pthread_mutex_t** and **pthread_cond_t** objects (instead of on attributes objects).

The difficulties with this solution are:

1. A bitmask is not opaque if bits have to be set into bitvector attributes objects using explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an **int**, application programmers need to know the location of each bit. If bits are set or read by encapsulation (that is, get and set functions), then the bitmask is merely an implementation of attributes objects as currently defined and should not be exposed to the programmer.

2. Many attributes are not Boolean or very small integral values. For example, scheduling policy may be placed in 3-bit or 4-bit, but priority requires 5-bit or more, thereby taking up at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this, the bitmask can only reasonably control whether particular attributes are set or not, and it cannot serve as the repository of the value itself. The value needs to be specified as a function parameter (which is non-extensible), or by setting a structure field (which is non-opaque), or by get and set functions (making the bitmask a redundant addition to the attributes objects).

Stack size is defined as an optional attribute because the very notion of a stack is inherently machine-dependent. Some implementations may not be able to change the size of the stack, for example, and others may not need to because stack pages may be discontiguous and can be allocated and released on demand.

The attribute mechanism has been designed in large measure for extensibility. Future extensions to the attribute mechanism or to any attributes object defined in this volume of POSIX.1-2017 has to be done with care so as not to affect binary-compatibility.

Attributes objects, even if allocated by means of dynamic allocation functions such as *malloc*( ),

may have their size fixed at compile time. This means, for example, a *pthread_create*( ) in an implementation with extensions to **pthread_attr_t** cannot look beyond the area that the binary application assumes is valid. This suggests that implementations should maintain a size field in the attributes object, as well as possibly version information, if extensions in different directions (possibly by different vendors) are to be accommodated.

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_destroy*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_init*( ) refers to an already initialized thread attributes object, it is recommended that the function should fail and report an [EBUSY] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_attr_destroy*( ) and *pthread_attr_init*( ) functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1 #107 is applied, noting that the effect of initializing an already initialized thread attributes object is undefined.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/71 is applied, updating the ERRORS section to add the optional [EINVAL] error for the *pthread_attr_destroy*( ) function, and the optional [EBUSY] error for the *pthread_attr_init*( ) function.

Issue 7

The *pthread_attr_destroy*( ) and *pthread_attr_init*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

The [EBUSY] error for an already initialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_attr_getdetachstate, pthread_attr_setdetachstate — get and set the detachstate attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_attr_getdetachstate(const pthread_attr_t *attr,
    int *detachstate);
int pthread_attr_setdetachstate(pthread_attr_t *attr, int detachstate);
```

DESCRIPTION

The *detachstate* attribute controls whether the thread is created in a detached state. If the thread is created detached, then use of the ID of the newly created thread by the *pthread_detach*( ) or *pthread_join*( ) function is an error.

The *pthread_attr_getdetachstate*( ) and *pthread_attr_setdetachstate*( ) functions, respectively, shall get and set the *detachstate* attribute in the *attr* object.

For *pthread_attr_getdetachstate*( ), *detachstate* shall be set to either PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE.

For *pthread_attr_setdetachstate*( ), the application shall set *detachstate* to either PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE.

A value of PTHREAD_CREATE_DETACHED shall cause all threads created with *attr* to be in the detached state, whereas using a value of PTHREAD_CREATE_JOINABLE shall cause all threads created with *attr* to be in the joinable state. The default value of the *detachstate* attribute shall be PTHREAD_CREATE_JOINABLE.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getdetachstate*( ) or *pthread_attr_setdetachstate*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

Upon successful completion, *pthread_attr_getdetachstate*( ) and *pthread_attr_setdetachstate*( ) shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

The *pthread_attr_getdetachstate*( ) function stores the value of the *detachstate* attribute in *detachstate* if successful.

ERRORS

The *pthread_attr_setdetachstate*( ) function shall fail if:

[EINVAL] The value of *detachstate* was not valid

These functions shall not return an error code of [EINTR].

EXAMPLES

Retrieving the detachstate Attribute

This example shows how to obtain the *detachstate* attribute of a thread attribute object.

```
#include <pthread.h>

pthread_attr_t thread_attr;
int            detachstate;
int            rc;

/* code initializing thread_attr */
...
```

```
        rc = pthread_attr_getdetachstate (&thread_attr, &detachstate);
        if (rc!=0) {
            /* handle error */
            ...
        }
        else {
            /* legal values for detachstate are:
             * PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE
             */
             ...
        }
```

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getdetachstate*( ) or *pthread_attr_setdetachstate*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_attr_setdetachstate*( ) and *pthread_attr_getdetachstate*( ) functions are marked as part of the Threads option.

The normative text is updated to avoid use of the term ``must'' for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/72 is applied, adding the example to the EXAMPLES section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/73 is applied, updating the ERRORS section to include the optional [EINVAL] error.

Issue 7

The *pthread_attr_setdetachstate*( ) and *pthread_attr_getdetachstate*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_attr_getguardsize, pthread_attr_setguardsize — get and set the thread guardsize attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_attr_getguardsize(const pthread_attr_t *restrict attr,
    size_t *restrict guardsize);
int pthread_attr_setguardsize(pthread_attr_t *attr,
    size_t guardsize);
```

DESCRIPTION

The *pthread_attr_getguardsize*( ) function shall get the *guardsize* attribute in the *attr* object. This attribute shall be returned in the *guardsize* parameter.

The *pthread_attr_setguardsize*( ) function shall set the *guardsize* attribute in the *attr* object. The new value of this attribute shall be obtained from the *guardsize* parameter. If *guardsize* is zero, a guard area shall not be provided for threads created with *attr*. If *guardsize* is greater than zero, a guard area of at least size *guardsize* bytes shall be provided for each thread created with *attr*.

The *guardsize* attribute controls the size of the guard area for the created thread's stack. The *guardsize* attribute provides protection against overflow of the stack pointer. If a thread's stack is created with guard protection, the implementation allocates extra memory at the overflow end of the stack as a buffer against stack overflow of the stack pointer. If an application overflows into this buffer an error shall result (possibly in a SIGSEGV signal being delivered to the thread).

A conforming implementation may round up the value contained in *guardsize* to a multiple of the configurable system variable {PAGESIZE} (see **<sys/mman.h>**). If an implementation rounds up the value of *guardsize* to a multiple of {PAGESIZE}, a call to *pthread_attr_getguardsize*( ) specifying *attr* shall store in the *guardsize* parameter the guard size specified by the previous *pthread_attr_setguardsize*( ) function call.

The default value of the *guardsize* attribute is implementation-defined.

If the *stackaddr* attribute has been set (that is, the caller is allocating and managing its own thread stacks), the *guardsize* attribute shall be ignored and no protection shall be provided by the implementation. It is the responsibility of the application to manage stack overflow along with stack allocation and management in this case.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getguardsize*( ) or *pthread_attr_setguardsize*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getguardsize*( ) and *pthread_attr_setguardsize*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions shall fail if:

[EINVAL] The parameter *guardsize* is invalid.

These functions shall not return an error code of [EINTR].

EXAMPLES

Retrieving the guardsize Attribute

This example shows how to obtain the *guardsize* attribute of a thread attribute object.

```
#include <pthread.h>

pthread_attr_t thread_attr;
size_t  guardsize;
int     rc;

/* code initializing thread_attr */
...

rc = pthread_attr_getguardsize (&thread_attr, &guardsize);
if (rc != 0)  {
    /* handle error */
    ...
}
else {
    if (guardsize > 0) {
    /* a guard area of at least guardsize bytes is provided */
    ...
    }
    else {
    /* no guard area provided */
    ...
    }
}
```

APPLICATION USAGE

None.

RATIONALE

The *guardsize* attribute is provided to the application for two reasons:

1. Overflow protection can potentially result in wasted system resources. An application that creates a large number of threads, and which knows its threads never overflow their stack, can save system resources by turning off guard areas.
2. When threads allocate large data structures on the stack, large guard areas may be needed to detect stack overflow.

The default size of the guard area is left implementation-defined since on systems supporting very large page sizes, the overhead might be substantial if at least one guard page is required by default.

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getguardsize*( ) or *pthread_attr_setguardsize*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD **<pthread.h>**, **<sys/mman.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

In the ERRORS section, a third [EINVAL] error condition is removed as it is covered by the second error condition.

The **restrict** keyword is added to the *pthread_attr_getguardsize*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/74 is applied, updating the ERRORS section to remove the [EINVAL] error (``The attribute *attr* is invalid.''), and replacing it with the optional [EINVAL] error.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/76 is applied, adding the example to the EXAMPLES section.

Issue 7

SD5-XSH-ERN-111 is applied, removing the reference to the *stack* attribute in the DESCRIPTION.

SD5-XSH-ERN-175 is applied, updating the DESCRIPTION to note that the default size of the guard area is implementation-defined.

The *pthread_attr_getguardsize*( ) and *pthread_attr_setguardsize*( ) functions are moved from the XSI option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_attr_getinheritsched, pthread_attr_setinheritsched ‡' get and set the inheritsched attribute (**REALTIME THREADS**)

SYNOPSIS

TPS

```
#include <pthread.h>

int pthread_attr_getinheritsched(const pthread_attr_t *restrict attr,
    int *restrict inheritsched);
int pthread_attr_setinheritsched(pthread_attr_t *attr,
    int inheritsched);
```

DESCRIPTION

The *pthread_attr_getinheritsched*( ) and *pthread_attr_setinheritsched*( ) functions, respectively, shall get and set the *inheritsched* attribute in the *attr* argument.

When the attributes objects are used by *pthread_create*( ), the *inheritsched* attribute determines how the other scheduling attributes of the created thread shall be set.

The supported values of *inheritsched* shall be:

PTHREAD_INHERIT_SCHED
: Specifies that the thread scheduling attributes shall be inherited from the creating thread, and the scheduling attributes in this *attr* argument shall be ignored.

PTHREAD_EXPLICIT_SCHED
: Specifies that the thread scheduling attributes shall be set to the corresponding values from this attributes object.

The symbols PTHREAD_INHERIT_SCHED and PTHREAD_EXPLICIT_SCHED are defined in the **<pthread.h>** header.

The following thread scheduling attributes defined by POSIX.1-2017 are affected by the *inheritsched* attribute: scheduling policy (*schedpolicy*), scheduling parameters (*schedparam*), and scheduling contention scope (*contentionscope*).

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getinheritsched*( ) or *pthread_attr_setinheritsched*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getinheritsched*( ) and *pthread_attr_setinheritsched*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_setinheritsched*( ) function shall fail if:

[ENOTSUP] An attempt was made to set the attribute to an unsupported value.

The *pthread_attr_setinheritsched*( ) function may fail if:

[EINVAL] The value of *inheritsched* is not valid.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using *pthread_create*( ). Using these routines does not affect the current running thread.

See Section 2.9.4 (on page 515) for further details on thread scheduling attributes and their default settings.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getinheritsched*( ) or *pthread_attr_setinheritsched*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

XBD **<pthread.h>**, **<sched.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Marked as part of the Realtime Threads Feature Group.

Issue 6

The *pthread_attr_getinheritsched*( ) and *pthread_attr_setinheritsched*( ) functions are marked as part of the Threads and Thread Execution Scheduling options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Execution Scheduling option.

The **restrict** keyword is added to the *pthread_attr_getinheritsched*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/75 is applied, clarifying the values of *inheritsched* in the DESCRIPTION and adding two optional [EINVAL] errors to the ERRORS section for checking when *attr* refers to an uninitialized thread attribute object.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/77 is applied, adding a reference to Section 2.9.4 (on page 515) in the APPLICATION USAGE section.

Issue 7

The *pthread_attr_getinheritsched*( ) and *pthread_attr_setinheritsched*( ) functions are marked only as part of the Thread Execution Scheduling option as the Threads option is now part of the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0450 [314] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0262 [757] is applied.

NAME

pthread_attr_getschedparam, pthread_attr_setschedparam — get and set the schedparam attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_attr_getschedparam(const pthread_attr_t *restrict attr,
    struct sched_param *restrict param);
int pthread_attr_setschedparam(pthread_attr_t *restrict attr,
    const struct sched_param *restrict param);
```

DESCRIPTION

The *pthread_attr_getschedparam*( ) and *pthread_attr_setschedparam*( ) functions, respectively, shall get and set the scheduling parameter attributes in the *attr* argument. The contents of the *param* structure are defined in the **<sched.h>** header. For the SCHED_FIFO and SCHED_RR policies, the only required member of *param* is *sched_priority*.

TSP For the SCHED_SPORADIC policy, the required members of the *param* structure are *sched_priority*, *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, and *sched_ss_max_repl*. The specified *sched_ss_repl_period* must be greater than or equal to the specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail. The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getschedparam*( ) or *pthread_attr_setschedparam*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getschedparam*( ) and *pthread_attr_setschedparam*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_setschedparam*( ) function shall fail if:

[ENOTSUP] An attempt was made to set the attribute to an unsupported value.

The *pthread_attr_setschedparam*( ) function may fail if:

[EINVAL] The value of *param* is not valid.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using *pthread_create*( ). Using these routines does not affect the current running thread.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getschedparam*( ) or *pthread_attr_setschedparam*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_attr_getschedparam*( ) and *pthread_attr_setschedparam*( ) functions are marked as part of the Threads option.

The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread_attr_getschedparam*( ) and *pthread_attr_setschedparam*( ) prototypes for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/78 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

Issue 7

The *pthread_attr_getschedparam*( ) and *pthread_attr_setschedparam*( ) functions are moved from the Threads option to the Base.

Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements for the *sched_ss_repl_period* and *sched_ss_init_budget* values.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0451 [314] is applied.

NAME

pthread_attr_getschedpolicy, pthread_attr_setschedpolicy ‡' get and set the schedpolicy attribute (**REALTIME THREADS**)

SYNOPSIS

TPS
```
#include <pthread.h>

int pthread_attr_getschedpolicy(const pthread_attr_t *restrict attr,
    int *restrict policy);
int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);
```

DESCRIPTION

The *pthread_attr_getschedpolicy*( ) and *pthread_attr_setschedpolicy*( ) functions, respectively, shall get and set the *schedpolicy* attribute in the *attr* argument.

The supported values of *policy* shall include SCHED_FIFO, SCHED_RR, and SCHED_OTHER, which are defined in the **<sched.h>** header. When threads executing with the scheduling policy
TSP SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC are waiting on a mutex, they shall acquire the mutex in priority order when the mutex is unlocked.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getschedpolicy*( ) or *pthread_attr_setschedpolicy*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getschedpolicy*( ) and *pthread_attr_setschedpolicy*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_setschedpolicy*( ) function shall fail if:

[ENOTSUP] An attempt was made to set the attribute to an unsupported value.

The *pthread_attr_setschedpolicy*( ) function may fail if:

[EINVAL] The value of *policy* is not valid.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using *pthread_create*( ). Using these routines does not affect the current running thread.

See Section 2.9.4 (on page 515) for further details on thread scheduling attributes and their default settings.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getschedpolicy*( ) or *pthread_attr_setschedpolicy*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

NAME

pthread_attr_getscope, pthread_attr_setscope ‡' get and set the contentionscope attribute (**REALTIME THREADS**)

SYNOPSIS

TPS

```
#include <pthread.h>

int pthread_attr_getscope(const pthread_attr_t *restrict attr,
    int *restrict contentionscope);
int pthread_attr_setscope(pthread_attr_t *attr, int contentionscope);
```

DESCRIPTION

The *pthread_attr_getscope*( ) and *pthread_attr_setscope*( ) functions, respectively, shall get and set the *contentionscope* attribute in the *attr* object.

The *contentionscope* attribute may have the values PTHREAD_SCOPE_SYSTEM, signifying system scheduling contention scope, or PTHREAD_SCOPE_PROCESS, signifying process scheduling contention scope. The symbols PTHREAD_SCOPE_SYSTEM and PTHREAD_SCOPE_PROCESS are defined in the **<pthread.h>** header.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getscope*( ) or *pthread_attr_setscope*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getscope*( ) and *pthread_attr_setscope*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_setscope*( ) function shall fail if:

[ENOTSUP] An attempt was made to set the attribute to an unsupported value.

The *pthread_attr_setscope*( ) function may fail if:

[EINVAL] The value of *contentionscope* is not valid.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using *pthread_create*( ). Using these routines does not affect the current running thread.

See Section 2.9.4 (on page 515) for further details on thread scheduling attributes and their default settings.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getscope*( ) or *pthread_attr_setscope*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

NAME

pthread_attr_getstack, pthread_attr_setstack — get and set stack attributes

SYNOPSIS

TSA TSS

```
#include <pthread.h>

int pthread_attr_getstack(const pthread_attr_t *restrict attr,
    void **restrict stackaddr, size_t *restrict stacksize);
int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,
    size_t stacksize);
```

DESCRIPTION

The *pthread_attr_getstack*( ) and *pthread_attr_setstack*( ) functions, respectively, shall get and set the thread creation stack attributes *stackaddr* and *stacksize* in the *attr* object.

The stack attributes specify the area of storage to be used for the created thread's stack. The base (lowest addressable byte) of the storage shall be *stackaddr*, and the size of the storage shall be *stacksize* bytes. The *stacksize* shall be at least {PTHREAD_STACK_MIN}. The *pthread_attr_setstack*( ) function may fail with [EINVAL] if *stackaddr* does not meet implementation-defined alignment requirements. All pages within the stack described by *stackaddr* and *stacksize* shall be both readable and writable by the thread.

If the *pthread_attr_getstack*( ) function is called before the *stackaddr* attribute has been set, the behavior is unspecified.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getstack*( ) or *pthread_attr_setstack*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

Upon successful completion, these functions shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

The *pthread_attr_getstack*( ) function shall store the stack attribute values in *stackaddr* and *stacksize* if successful.

ERRORS

The *pthread_attr_setstack*( ) function shall fail if:

[EINVAL] The value of *stacksize* is less than {PTHREAD_STACK_MIN} or exceeds an implementation-defined limit.

The *pthread_attr_setstack*( ) function may fail if:

[EINVAL] The value of *stackaddr* does not have proper alignment to be used as a stack, or ((**char** *)*stackaddr* + *stacksize*) lacks proper alignment.

[EACCES] The stack page(s) described by *stackaddr* and *stacksize* are not both readable and writable by the thread.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

These functions are appropriate for use by applications in an environment where the stack for a thread must be placed in some particular region of memory.

While it might seem that an application could detect stack overflow by providing a protected page outside the specified stack region, this cannot be done portably. Implementations are free to place the thread's initial stack pointer anywhere within the specified region to accommodate the machine's stack pointer behavior and allocation requirements. Furthermore, on some architectures, such as the IA-64, ``overflow'' might mean that two separate stack pointers allocated within the region will overlap somewhere in the middle of the region.

After a successful call to *pthread_attr_setstack*( ), the storage area specified by the *stackaddr* parameter is under the control of the implementation, as described in Section 2.9.8 (on page 522).

The specification of the *stackaddr* attribute presents several ambiguities that make portable use of these functions impossible. For example, the standard allows implementations to impose arbitrary alignment requirements on *stackaddr*. Applications cannot assume that a buffer obtained from *malloc*( ) is suitably aligned. Note that although the *stacksize* value passed to *pthread_attr_setstack*( ) must satisfy alignment requirements, the same is not true for *pthread_attr_setstacksize*( ) where the implementation must increase the specified size if necessary to achieve the proper alignment.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getstack*( ) or *pthread_attr_setstack*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

XBD **<limits.h>**, **<pthread.h>**

CHANGE HISTORY

First released in Issue 6. Developed as part of the XSI option and brought into the BASE by IEEE PASC Interpretation 1003.1 #101.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/83 is applied, updating the APPLICATION USAGE section to refer to Section 2.9.8 (on page 522).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC/D6/84 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

Issue 7

SD5-XSH-ERN-66 is applied, correcting the use of *attr* in the [EINVAL] error condition.

Austin Group Interpretation 1003.1-2001 #057 is applied, clarifying the behavior if the function is called before the *stackaddr* attribute is set.

SD5-XSH-ERN-157 is applied, updating the APPLICATION USAGE section.

The description of the *stackaddr* attribute is updated in the DESCRIPTION and APPLICATION USAGE sections.

51860 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition
51861 results in undefined behavior.

NAME

pthread_attr_getstacksize, pthread_attr_setstacksize — get and set the stacksize attribute

SYNOPSIS

TSS

```
#include <pthread.h>

int pthread_attr_getstacksize(const pthread_attr_t *restrict attr,
    size_t *restrict stacksize);
int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);
```

DESCRIPTION

The *pthread_attr_getstacksize*( ) and *pthread_attr_setstacksize*( ) functions, respectively, shall get and set the thread creation *stacksize* attribute in the *attr* object.

The *stacksize* attribute shall define the minimum stack size (in bytes) allocated for the created threads stack.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getstacksize*( ) or *pthread_attr_setstacksize*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

Upon successful completion, *pthread_attr_getstacksize*( ) and *pthread_attr_setstacksize*( ) shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

The *pthread_attr_getstacksize*( ) function stores the *stacksize* attribute value in *stacksize* if successful.

ERRORS

The *pthread_attr_setstacksize*( ) function shall fail if:

[EINVAL] The value of *stacksize* is less than {PTHREAD_STACK_MIN} or exceeds a system-imposed limit.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getstacksize*( ) or *pthread_attr_setstacksize*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_attr_getstacksize*( ) and *pthread_attr_setstacksize*( ) functions are marked as part of the Threads and Thread Stack Size Attribute options.

The **restrict** keyword is added to the *pthread_attr_getstacksize*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/43 is applied, correcting the margin code in the SYNOPSIS from TSA to TSS and updating the CHANGE HISTORY from ``Thread Stack Address Attribute'' option to ``Thread Stack Size Attribute'' option.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/87 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

Issue 7

The *pthread_attr_getstacksize*( ) and *pthread_attr_setstacksize*( ) functions are marked only as part of the Thread Stack Size Attribute option as the Threads option is now part of the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0265 [757] is applied.

51919 **NAME**

51920 pthread_attr_init — initialize the thread attributes object

51921 **SYNOPSIS**

51922 `#include <pthread.h>`

51923 `int pthread_attr_init(pthread_attr_t *attr);`

51924 **DESCRIPTION**

51925 Refer to *pthread_attr_destroy( )*.

51926 **NAME**

51927 pthread_attr_setdetachstate — set the detachstate attribute

51928 **SYNOPSIS**

51929 `#include <pthread.h>`

51930 `int pthread_attr_setdetachstate(pthread_attr_t *attr, int detachstate);`

51931 **DESCRIPTION**

51932 Refer to *pthread_attr_getdetachstate( )*.

51933 **NAME**

51934 pthread_attr_setguardsize — set the thread guardsize attribute

51935 **SYNOPSIS**

51936 ```
#include <pthread.h>
```

51937 ```
int pthread_attr_setguardsize(pthread_attr_t *attr,
```

51938 ```
    size_t guardsize);
```

51939 **DESCRIPTION**

51940 Refer to *pthread_attr_getguardsize( )*.

  
```

NAME

pthread_attr_setinheritsched — set the inheritsched attribute (**REALTIME THREADS**)

SYNOPSIS

TPS

```

DESCRIPTION

Refer to *pthread_attr_getstack( )*.

NAME

pthread_attr_setstacksize — set the stacksize attribute

SYNOPSIS

TSS

```
#include <pthread.h>

int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);
```

DESCRIPTION

Refer to *pthread_attr_getstacksize( )*.

NAME

pthread_barrier_destroy, pthread_barrier_init — destroy and initialize a barrier object

SYNOPSIS

```
#include <pthread.h>

int pthread_barrier_destroy(pthread_barrier_t *barrier);
int pthread_barrier_init(pthread_barrier_t *restrict barrier,
    const pthread_barrierattr_t *restrict attr, unsigned count);
```

DESCRIPTION

The *pthread_barrier_destroy*( ) function shall destroy the barrier referenced by *barrier* and release any resources used by the barrier. The effect of subsequent use of the barrier is undefined until the barrier is reinitialized by another call to *pthread_barrier_init*( ). An implementation may use this function to set *barrier* to an invalid value. The results are undefined if *pthread_barrier_destroy*( ) is called when any thread is blocked on the barrier, or if this function is called with an uninitialized barrier.

The *pthread_barrier_init*( ) function shall allocate any resources required to use the barrier referenced by *barrier* and shall initialize the barrier with attributes referenced by *attr*. If *attr* is NULL, the default barrier attributes shall be used; the effect is the same as passing the address of a default barrier attributes object. The results are undefined if *pthread_barrier_init*( ) is called when any thread is blocked on the barrier (that is, has not returned from the *pthread_barrier_wait*( ) call). The results are undefined if a barrier is used without first being initialized. The results are undefined if *pthread_barrier_init*( ) is called specifying an already initialized barrier.

The *count* argument specifies the number of threads that must call *pthread_barrier_wait*( ) before any of them successfully return from the call. The value specified by *count* must be greater than zero.

If the *pthread_barrier_init*( ) function fails, the barrier shall not be initialized and the contents of *barrier* are undefined.

See Section 2.9.9 (on page 523) for further requirements.

RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_barrier_init*( ) function shall fail if:

[EAGAIN] The system lacks the necessary resources to initialize another barrier.

[EINVAL] The value specified by *count* is equal to zero.

[ENOMEM] Insufficient memory exists to initialize the barrier.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *barrier* argument to *pthread_barrier_destroy*( ) does not refer to an initialized barrier object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *attr* argument to *pthread_barrier_init*( ) does not refer to an initialized barrier attributes object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *barrier* argument to *pthread_barrier_destroy*( ) or *pthread_barrier_init*( ) refers to a barrier that is in use (for example, in a *pthread_barrier_wait*( ) call) by another thread, or detects that the value specified by the *barrier* argument to *pthread_barrier_init*( ) refers to an already initialized barrier object, it is recommended that the function should fail and report an [EBUSY] error.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

Issue 7

The *pthread_barrier_destroy*( ) and *pthread_barrier_init*( ) functions are moved from the Barriers option to the Base.

The [EINVAL] error for an uninitialized barrier object and an uninitialized barrier attributes object is removed; this condition results in undefined behavior.

The [EBUSY] error for a barrier that is in use or an already initialized barrier object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0266 [972] is applied.

NAME

pthread_barrier_wait — synchronize at a barrier

SYNOPSIS

```
#include <pthread.h>

int pthread_barrier_wait(pthread_barrier_t *barrier);
```

DESCRIPTION

The *pthread_barrier_wait*( ) function shall synchronize participating threads at the barrier referenced by *barrier*. The calling thread shall block until the required number of threads have called *pthread_barrier_wait*( ) specifying the barrier.

When the required number of threads have called *pthread_barrier_wait*( ) specifying the barrier, the constant PTHREAD_BARRIER_SERIAL_THREAD shall be returned to one unspecified thread and zero shall be returned to each of the remaining threads. At this point, the barrier shall be reset to the state it had as a result of the most recent *pthread_barrier_init*( ) function that referenced it.

The constant PTHREAD_BARRIER_SERIAL_THREAD is defined in **<pthread.h>** and its value shall be distinct from any other value returned by *pthread_barrier_wait*( ).

The results are undefined if this function is called with an uninitialized barrier.

If a signal is delivered to a thread blocked on a barrier, upon return from the signal handler the thread shall resume waiting at the barrier if the barrier wait has not completed (that is, if the required number of threads have not arrived at the barrier during the execution of the signal handler); otherwise, the thread shall continue as normal from the completed barrier wait. Until the thread in the signal handler returns from it, it is unspecified whether other threads may proceed past the barrier once they have all reached it.

A thread that has blocked on a barrier shall not prevent any unblocked thread that is eligible to use the same processing resources from eventually making forward progress in its execution. Eligibility for processing resources shall be determined by the scheduling policy.

RETURN VALUE

Upon successful completion, the *pthread_barrier_wait*( ) function shall return PTHREAD_BARRIER_SERIAL_THREAD for a single (arbitrary) thread synchronized at the barrier and zero for each of the other threads. Otherwise, an error number shall be returned to indicate the error.

ERRORS

This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using this function may be subject to priority inversion, as discussed in XBD Section 3.291 (on page 80).

RATIONALE

If an implementation detects that the value specified by the *barrier* argument to *pthread_barrier_wait*( ) does not refer to an initialized barrier object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

Issue 7

The *pthread_barrier_wait*( ) function is moved from the Barriers option to the Base.

The [EINVAL] error for an uninitialized barrier object is removed; this condition results in undefined behavior.

NAME

pthread_barrierattr_destroy, pthread_barrierattr_init — destroy and initialize the barrier attributes object

SYNOPSIS

```
#include <pthread.h>

int pthread_barrierattr_destroy(pthread_barrierattr_t *attr);
int pthread_barrierattr_init(pthread_barrierattr_t *attr);
```

DESCRIPTION

The *pthread_barrierattr_destroy*( ) function shall destroy a barrier attributes object. A destroyed *attr* attributes object can be reinitialized using *pthread_barrierattr_init*( ); the results of otherwise referencing the object after it has been destroyed are undefined. An implementation may cause *pthread_barrierattr_destroy*( ) to set the object referenced by *attr* to an invalid value.

The *pthread_barrierattr_init*( ) function shall initialize a barrier attributes object *attr* with the default value for all of the attributes defined by the implementation.

If *pthread_barrierattr_init*( ) is called specifying an already initialized *attr* attributes object, the results are undefined.

After a barrier attributes object has been used to initialize one or more barriers, any function affecting the attributes object (including destruction) shall not affect any previously initialized barrier.

The behavior is undefined if the value specified by the *attr* argument to *pthread_barrierattr_destroy*( ) does not refer to an initialized barrier attributes object.

RETURN VALUE

If successful, the *pthread_barrierattr_destroy*( ) and *pthread_barrierattr_init*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_barrierattr_init*( ) function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the barrier attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_barrierattr_destroy*( ) does not refer to an initialized barrier attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

pthread_barrierattr_getpshared( )

XBD **<pthread.h>**

52149 **CHANGE HISTORY**

52150 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

52151 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

52152 **Issue 7**

52153 The *pthread_barrierattr_destroy*( ) and *pthread_barrierattr_init*( ) functions are moved from the
52154 Barriers option to the Base.

52155 The [EINVAL] error for an uninitialized barrier attributes object is removed; this condition
52156 results in undefined behavior.

NAME

pthread_barrierattr_getpshared, pthread_barrierattr_setpshared ‡' get and set the process-shared attribute of the barrier attributes object

SYNOPSIS

TSH

```
#include <pthread.h>

int pthread_barrierattr_getpshared(const pthread_barrierattr_t
    *restrict attr, int *restrict pshared);
int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
    int pshared);
```

DESCRIPTION

The *pthread_barrierattr_getpshared*( ) function shall obtain the value of the *process-shared* attribute from the attributes object referenced by *attr*. The *pthread_barrierattr_setpshared*( ) function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

The *process-shared* attribute is set to PTHREAD_PROCESS_SHARED to permit a barrier to be operated upon by any thread that has access to the memory where the barrier is allocated. See Section 2.9.9 (on page 523) for further requirements. The default value of the attribute shall be PTHREAD_PROCESS_PRIVATE. Both constants PTHREAD_PROCESS_SHARED and PTHREAD_PROCESS_PRIVATE are defined in **<pthread.h>**.

Additional attributes, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

The behavior is undefined if the value specified by the *attr* argument to *pthread_barrierattr_getpshared*( ) or *pthread_barrierattr_setpshared*( ) does not refer to an initialized barrier attributes object.

RETURN VALUE

If successful, the *pthread_barrierattr_getpshared*( ) function shall return zero and store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise, an error number shall be returned to indicate the error.

If successful, the *pthread_barrierattr_setpshared*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_barrierattr_setpshared*( ) function may fail if:

[EINVAL] The new value specified for the *process-shared* attribute is not one of the legal values PTHREAD_PROCESS_SHARED or PTHREAD_PROCESS_PRIVATE.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

The *pthread_barrierattr_getpshared*( ) and *pthread_barrierattr_setpshared*( ) functions are part of the Thread Process-Shared Synchronization option and need not be provided on all implementations.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_barrierattr_getpshared*( ) or *pthread_barrierattr_setpshared*( ) does not refer to an initialized barrier attributes object, it is recommended that the function should fail and report an [EINVAL]

error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000

Issue 7

The *pthread_barrierattr_getpshared*( ) and *pthread_barrierattr_setpshared*( ) functions are marked only as part of the Thread Process-Shared Synchronization option as the Threads option is now part of the Base.

The [EINVAL] error for an uninitialized barrier attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0266 [972] and XSH/TC2-2008/0267 [757] are applied.

52217 **NAME**

52218 pthread_barrierattr_init — initialize the barrier attributes object

52219 **SYNOPSIS**

52220 `#include <pthread.h>`

52221 `int pthread_barrierattr_init(pthread_barrierattr_t *attr);`

52222 **DESCRIPTION**

52223 Refer to *pthread_barrierattr_destroy( )*.

NAME

pthread_barrierattr_setpshared — set the process-shared attribute of the barrier attributes object

SYNOPSIS

TSH

```
#include <pthread.h>

int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
    int pshared);
```

DESCRIPTION

Refer to *pthread_barrierattr_getpshared( )*.

52232 **NAME**

52233 pthread_cancel — cancel execution of a thread

52234 **SYNOPSIS**

52235 `#include <pthread.h>`

52236 `int pthread_cancel(pthread_t thread);`

52237 **DESCRIPTION**

52238 The *pthread_cancel*( ) function shall request that *thread* be canceled. The target thread's
52239 cancelability state and type determines when the cancellation takes effect. When the cancellation
52240 is acted on, the cancellation cleanup handlers for *thread* shall be called. When the last
52241 cancellation cleanup handler returns, the thread-specific data destructor functions shall be called
52242 for *thread*. When the last destructor function returns, *thread* shall be terminated.

52243 The cancellation processing in the target thread shall run asynchronously with respect to the
52244 calling thread returning from *pthread_cancel*( ).

52245 **RETURN VALUE**

52246 If successful, the *pthread_cancel*( ) function shall return zero; otherwise, an error number shall be
52247 returned to indicate the error.

52248 **ERRORS**

52249 The *pthread_cancel*( ) function shall not return an error code of [EINTR].

52250 **EXAMPLES**

52251 None.

52252 **APPLICATION USAGE**

52253 None.

52254 **RATIONALE**

52255 Two alternative functions were considered for sending the cancellation notification to a thread.
52256 One would be to define a new SIGCANCEL signal that had the cancellation semantics when
52257 delivered; the other was to define the new *pthread_cancel*( ) function, which would trigger the
52258 cancellation semantics.

52259 The advantage of a new signal was that so much of the delivery criteria were identical to that
52260 used when trying to deliver a signal that making cancellation notification a signal was seen as
52261 consistent. Indeed, many implementations implement cancellation using a special signal. On the
52262 other hand, there would be no signal functions that could be used with this signal except
52263 *pthread_kill*( ), and the behavior of the delivered cancellation signal would be unlike any
52264 previously existing defined signal.

52265 The benefits of a special function include the recognition that this signal would be defined
52266 because of the similar delivery criteria and that this is the only common behavior between a
52267 cancellation request and a signal. In addition, the cancellation delivery mechanism does not
52268 have to be implemented as a signal. There are also strong, if not stronger, parallels with
52269 language exception mechanisms than with signals that are potentially obscured if the delivery
52270 mechanism is visibly closer to signals.

52271 In the end, it was considered that as there were so many exceptions to the use of the new signal
52272 with existing signals functions it would be misleading. A special function has resolved this
52273 problem. This function was carefully defined so that an implementation wishing to provide the
52274 cancellation functions on top of signals could do so. The special function also means that
52275 implementations are not obliged to implement cancellation with signals.

52276 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended
52277 that the function should fail and report an [ESRCH] error.

52278 **FUTURE DIRECTIONS**

52279 None.

52280 **SEE ALSO**

52281 *pthread_exit*( ), *pthread_cond_timedwait*( ), *pthread_join*( ), *pthread_setcancelstate*( )

52282 XBD **<pthread.h>**

52283 **CHANGE HISTORY**

52284 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52285 **Issue 6**

52286 The *pthread_cancel*( ) function is marked as part of the Threads option.

52287 **Issue 7**

52288 The *pthread_cancel*( ) function is moved from the Threads option to the Base.

52289 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

52290 **NAME**

52291 pthread_cleanup_pop, pthread_cleanup_push — establish cancellation handlers

52292 **SYNOPSIS**

52293 ```
#include <pthread.h>
```

52294 ```
void pthread_cleanup_pop(int execute);
```

52295 ```
void pthread_cleanup_push(void (*routine)(void*), void *arg);
```

52296 **DESCRIPTION**

52297 The *pthread_cleanup_pop*( ) function shall remove the routine at the top of the calling thread's
52298 cancellation cleanup stack and optionally invoke it (if *execute* is non-zero).

52299 The *pthread_cleanup_push*( ) function shall push the specified cancellation cleanup handler *routine*
52300 onto the calling thread's cancellation cleanup stack. The cancellation cleanup handler shall be
52301 popped from the cancellation cleanup stack and invoked with the argument *arg* when:

52302 The thread exits (that is, calls *pthread_exit*( )).

52303 The thread acts upon a cancellation request.

52304 The thread calls *pthread_cleanup_pop*( ) with a non-zero *execute* argument.

52305 It is unspecified whether *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ) are macros or
52306 functions. If a macro definition is suppressed in order to access an actual function, or a program
52307 defines an external identifier with any of these names, the behavior is undefined. The
52308 application shall ensure that they appear as statements, and in pairs within the same lexical
52309 scope (that is, the *pthread_cleanup_push*( ) macro may be thought to expand to a token list whose
52310 first token is `'{'` with *pthread_cleanup_pop*( ) expanding to a token list whose last token is the
52311 corresponding `'}'`).

52312 The effect of calling *longjmp*( ) or *siglongjmp*( ) is undefined if there have been any calls to
52313 *pthread_cleanup_push*( ) or *pthread_cleanup_pop*( ) made without the matching call since the jump
52314 buffer was filled. The effect of calling *longjmp*( ) or *siglongjmp*( ) from inside a cancellation
52315 cleanup handler is also undefined unless the jump buffer was also filled in the cancellation
52316 cleanup handler.

52317 The effect of the use of **return**, **break**, **continue**, and **goto** to prematurely leave a code block
52318 described by a pair of *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ) functions calls is
52319 undefined.

52320 **RETURN VALUE**

52321 The *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ) functions shall not return a value.

52322 **ERRORS**

52323 No errors are defined.

52324 These functions shall not return an error code of [EINTR].

52325 **EXAMPLES**

52326 The following is an example using thread primitives to implement a cancelable, writers-priority
52327 read-write lock:

```
52328 typedef struct {
52329     pthread_mutex_t lock;
52330     pthread_cond_t rcond,
52331         wcond;
52332     int lock_count; /* < 0 .. Held by writer. */
52333                     /* > 0 .. Held by lock_count readers. */
52334                     /* = 0 .. Held by nobody. */
```

```

```
52335   int waiting_writers; /* Count of waiting writers. */
52336   } rwlock;
52337   void
52338   waiting_reader_cleanup(void *arg)
52339   {
52340   rwlock *l;
52341   l = (rwlock *) arg;
52342   pthread_mutex_unlock(&l->lock);
52343   }
52344   void
52345   lock_for_read(rwlock *l)
52346   {
52347   pthread_mutex_lock(&l->lock);
52348   pthread_cleanup_push(waiting_reader_cleanup, l);
52349   while ((l->lock_count < 0) || (l->waiting_writers != 0))
52350   pthread_cond_wait(&l->rcond, &l->lock);
52351   l->lock_count++;
52352   /*
52353   * Note the pthread_cleanup_pop executes
52354   * waiting_reader_cleanup.
52355   */
52356   pthread_cleanup_pop(1);
52357   }
52358   void
52359   release_read_lock(rwlock *l)
52360   {
52361   pthread_mutex_lock(&l->lock);
52362   if (--l->lock_count == 0)
52363   pthread_cond_signal(&l->wcond);
52364   pthread_mutex_unlock(&l->lock);
52365   }
52366   void
52367   waiting_writer_cleanup(void *arg)
52368   {
52369   rwlock *l;
52370   l = (rwlock *) arg;
52371   if ((--l->waiting_writers == 0) && (l->lock_count >= 0)) {
52372   /*
52373   * This only happens if we have been canceled. If the
52374   * lock is not held by a writer, there may be readers who
52375   * were blocked because waiting_writers was positive; they
52376   * can now be unblocked.
52377   */
52378   pthread_cond_broadcast(&l->rcond);
52379   }
52380   pthread_mutex_unlock(&l->lock);
52381   }
52382   void
```

```
52383         lock_for_write(rwlock *l)
52384         {
52385             pthread_mutex_lock(&l->lock);
52386             l->waiting_writers++;
52387             pthread_cleanup_push(waiting_writer_cleanup, l);
52388             while (l->lock_count != 0)
52389                 pthread_cond_wait(&l->wcond, &l->lock);
52390             l->lock_count = -1;
52391            /*
52392             * Note the pthread_cleanup_pop executes
52393             * waiting_writer_cleanup.
52394             */
52395             pthread_cleanup_pop(1);
52396         }
52397         void
52398         release_write_lock(rwlock *l)
52399         {
52400             pthread_mutex_lock(&l->lock);
52401             l->lock_count = 0;
52402             if (l->waiting_writers == 0)
52403                 pthread_cond_broadcast(&l->rcond);
52404             else
52405                 pthread_cond_signal(&l->wcond);
52406             pthread_mutex_unlock(&l->lock);
52407         }
52408         /*
52409          * This function is called to initialize the read/write lock.
52410          */
52411         void
52412         initialize_rwlock(rwlock *l)
52413         {
52414             pthread_mutex_init(&l->lock, pthread_mutexattr_default);
52415             pthread_cond_init(&l->wcond, pthread_condattr_default);
52416             pthread_cond_init(&l->rcond, pthread_condattr_default);
52417             l->lock_count = 0;
52418             l->waiting_writers = 0;
52419         }
52420         reader_thread()
52421         {
52422             lock_for_read(&lock);
52423             pthread_cleanup_push(release_read_lock, &lock);
52424            /*
52425             * Thread has read lock.
52426             */
52427             pthread_cleanup_pop(1);
52428         }
52429         writer_thread()
52430         {
52431             lock_for_write(&lock);
52432             pthread_cleanup_push(release_write_lock, &lock);
```

```
        /*
         * Thread has write lock.
         */
    pthread_cleanup_pop(1);
    }
```

APPLICATION USAGE

The two routines that push and pop cancellation cleanup handlers, *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ), can be thought of as left and right-parentheses. They always need to be matched.

RATIONALE

The restriction that the two routines that push and pop cancellation cleanup handlers, *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ), have to appear in the same lexical scope allows for efficient macro or compiler implementations and efficient storage management. A sample implementation of these routines as macros might look like this:

```
#define pthread_cleanup_push(rtn,arg) { \
    struct _pthread_handler_rec __cleanup_handler, **__head; \
    __cleanup_handler.rtn = rtn; \
    __cleanup_handler.arg = arg; \
    (void) pthread_getspecific(_pthread_handler_key, &__head); \
    __cleanup_handler.next = *__head; \
    *__head = &__cleanup_handler;

#define pthread_cleanup_pop(ex) \
    *__head = __cleanup_handler.next; \
    if (ex) (*__cleanup_handler.rtn)(__cleanup_handler.arg); \
}
```

A more ambitious implementation of these routines might do even better by allowing the compiler to note that the cancellation cleanup handler is a constant and can be expanded inline.

This volume of POSIX.1-2017 currently leaves unspecified the effect of calling *longjmp*( ) from a signal handler executing in a POSIX System Interfaces function. If an implementation wants to allow this and give the programmer reasonable behavior, the *longjmp*( ) function has to call all cancellation cleanup handlers that have been pushed but not popped since the time *setjmp*( ) was called.

Consider a multi-threaded function called by a thread that uses signals. If a signal were delivered to a signal handler during the operation of *qsort*( ) and that handler were to call *longjmp*( ) (which, in turn, did *not* call the cancellation cleanup handlers) the helper threads created by the *qsort*( ) function would not be canceled. Instead, they would continue to execute and write into the argument array even though the array might have been popped off the stack.

Note that the specified cleanup handling mechanism is especially tied to the C language and, while the requirement for a uniform mechanism for expressing cleanup is language-independent, the mechanism used in other languages may be quite different. In addition, this mechanism is really only necessary due to the lack of a real exception mechanism in the C language, which would be the ideal solution.

There is no notion of a cancellation cleanup-safe function. If an application has no cancellation points in its signal handlers, blocks any signal whose handler may have cancellation points while calling async-unsafe functions, or disables cancellation while calling async-unsafe functions, all functions may be safely called from cancellation cleanup routines.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_cleanup_pop*( ) and *pthread_cleanup_push*( ) functions are marked as part of the Threads option.

The APPLICATION USAGE section is added.

The normative text is updated to avoid use of the term ``must'' for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/88 is applied, updating the DESCRIPTION to describe the consequences of prematurely leaving a code block defined by the *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ) functions.

Issue 7

The *pthread_cleanup_pop*( ) and *pthread_cleanup_push*( ) functions are moved from the Threads option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0454 [229] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0268 [624] is applied.

52499 **NAME**

52500 pthread_cond_broadcast, pthread_cond_signal — broadcast or signal a condition

52501 **SYNOPSIS**

52502 ```
#include <pthread.h>

int pthread_cond_broadcast(pthread_cond_t *cond);
int pthread_cond_signal(pthread_cond_t *cond);
```

52505 **DESCRIPTION**

52506 These functions shall unblock threads blocked on a condition variable.

52507 The *pthread_cond_broadcast*( ) function shall unblock all threads currently blocked on the
52508 specified condition variable *cond*.

52509 The *pthread_cond_signal*( ) function shall unblock at least one of the threads that are blocked on
52510 the specified condition variable *cond* (if any threads are blocked on *cond*).

52511 If more than one thread is blocked on a condition variable, the scheduling policy shall determine
52512 the order in which threads are unblocked. When each thread unblocked as a result of a
52513 *pthread_cond_broadcast*( ) or *pthread_cond_signal*( ) returns from its call to *pthread_cond_wait*( ) or
52514 *pthread_cond_timedwait*( ), the thread shall own the mutex with which it called
52515 *pthread_cond_wait*( ) or *pthread_cond_timedwait*( ). The thread(s) that are unblocked shall contend
52516 for the mutex according to the scheduling policy (if applicable), and as if each had called
52517 *pthread_mutex_lock*( ).

52518 The *pthread_cond_broadcast*( ) or *pthread_cond_signal*( ) functions may be called by a thread
52519 whether or not it currently owns the mutex that threads calling *pthread_cond_wait*( ) or
52520 *pthread_cond_timedwait*( ) have associated with the condition variable during their waits;
52521 however, if predictable scheduling behavior is required, then that mutex shall be locked by the
52522 thread calling *pthread_cond_broadcast*( ) or *pthread_cond_signal*( ).

52523 The *pthread_cond_broadcast*( ) and *pthread_cond_signal*( ) functions shall have no effect if there are
52524 no threads currently blocked on *cond*.

52525 The behavior is undefined if the value specified by the *cond* argument to *pthread_cond_broadcast*( )
52526 or *pthread_cond_signal*( ) does not refer to an initialized condition variable.

52527 **RETURN VALUE**

52528 If successful, the *pthread_cond_broadcast*( ) and *pthread_cond_signal*( ) functions shall return zero;
52529 otherwise, an error number shall be returned to indicate the error.

52530 **ERRORS**

52531 These functions shall not return an error code of [EINTR].

52532 **EXAMPLES**

52533 None.

52534 **APPLICATION USAGE**

52535 The *pthread_cond_broadcast*( ) function is used whenever the shared-variable state has been
52536 changed in a way that more than one thread can proceed with its task. Consider a single
52537 producer/multiple consumer problem, where the producer can insert multiple items on a list
52538 that is accessed one item at a time by the consumers. By calling the *pthread_cond_broadcast*( )
52539 function, the producer would notify all consumers that might be waiting, and thereby the
52540 application would receive more throughput on a multi-processor. In addition,
52541 *pthread_cond_broadcast*( ) makes it easier to implement a read-write lock. The
52542 *pthread_cond_broadcast*( ) function is needed in order to wake up all waiting readers when a
52543 writer releases its lock. Finally, the two-phase commit algorithm can use this broadcast function
52544 to notify all clients of an impending transaction commit.

  
```

It is not safe to use the *pthread_cond_signal*( ) function in a signal handler that is invoked asynchronously. Even if it were safe, there would still be a race between the test of the Boolean *pthread_cond_wait*( ) that could not be efficiently eliminated.

Mutexes and condition variables are thus not suitable for releasing a waiting thread by signaling from code running in a signal handler.

RATIONALE

If an implementation detects that the value specified by the *cond* argument to *pthread_cond_broadcast*( ) or *pthread_cond_signal*( ) does not refer to an initialized condition variable, it is recommended that the function should fail and report an [EINVAL] error.

Multiple Awakenings by Condition Signal

On a multi-processor, it may be impossible for an implementation of *pthread_cond_signal*( ) to avoid the unblocking of more than one thread blocked on a condition variable. For example, consider the following partial implementation of *pthread_cond_wait*( ) and *pthread_cond_signal*( ), executed by two threads in the order given. One thread is trying to wait on the condition variable, another is concurrently executing *pthread_cond_signal*( ), while a third thread is already waiting.

```
pthread_cond_wait(mutex, cond):
    value = cond->value; /* 1 */
    pthread_mutex_unlock(mutex); /* 2 */
    pthread_mutex_lock(cond->mutex); /* 10 */
    if (value == cond->value) { /* 11 */
        me->next_cond = cond->waiter;
        cond->waiter = me;
        pthread_mutex_unlock(cond->mutex);
        unable_to_run(me);
    } else
        pthread_mutex_unlock(cond->mutex); /* 12 */
    pthread_mutex_lock(mutex); /* 13 */

pthread_cond_signal(cond):
    pthread_mutex_lock(cond->mutex); /* 3 */
    cond->value++; /* 4 */
    if (cond->waiter) { /* 5 */
        sleeper = cond->waiter; /* 6 */
        cond->waiter = sleeper->next_cond; /* 7 */
        able_to_run(sleeper); /* 8 */
    }
    pthread_mutex_unlock(cond->mutex); /* 9 */
```

The effect is that more than one thread can return from its call to *pthread_cond_wait*( ) or *pthread_cond_timedwait*( ) as a result of one call to *pthread_cond_signal*( ). This effect is called ``spurious wakeup''. Note that the situation is self-correcting in that the number of threads that are so awakened is finite; for example, the next thread to call *pthread_cond_wait*( ) after the sequence of events above blocks.

While this problem could be resolved, the loss of efficiency for a fringe condition that occurs only rarely is unacceptable, especially given that one has to check the predicate associated with a condition variable anyway. Correcting this problem would unnecessarily reduce the degree of concurrency in this basic building block for all higher-level synchronization operations.

An added benefit of allowing spurious wakeups is that applications are forced to code a

predicate-testing-loop around the condition wait. This also makes the application tolerate superfluous condition broadcasts or signals on the same condition variable that may be coded in some other part of the application. The resulting applications are thus more robust. Therefore, POSIX.1-2017 explicitly documents that spurious wakeups may occur.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_cond_broadcast*( ) and *pthread_cond_signal*( ) functions are marked as part of the Threads option.

The APPLICATION USAGE section is added.

Issue 7

The *pthread_cond_broadcast*( ) and *pthread_cond_signal*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized condition variable is removed; this condition results in undefined behavior.

NAME

pthread_cond_destroy, pthread_cond_init — destroy and initialize condition variables

SYNOPSIS

```
#include <pthread.h>

int pthread_cond_destroy(pthread_cond_t *cond);
int pthread_cond_init(pthread_cond_t *restrict cond,
    const pthread_condattr_t *restrict attr);
pthread_cond_t cond = PTHREAD_COND_INITIALIZER;
```

DESCRIPTION

The *pthread_cond_destroy*( ) function shall destroy the given condition variable specified by *cond*; the object becomes, in effect, uninitialized. An implementation may cause *pthread_cond_destroy*( ) to set the object referenced by *cond* to an invalid value. A destroyed condition variable object can be reinitialized using *pthread_cond_init*( ); the results of otherwise referencing the object after it has been destroyed are undefined.

It shall be safe to destroy an initialized condition variable upon which no threads are currently blocked. Attempting to destroy a condition variable upon which other threads are currently blocked results in undefined behavior.

The *pthread_cond_init*( ) function shall initialize the condition variable referenced by *cond* with attributes referenced by *attr*. If *attr* is NULL, the default condition variable attributes shall be used; the effect is the same as passing the address of a default condition variable attributes object. Upon successful initialization, the state of the condition variable shall become initialized.

See Section 2.9.9 (on page 523) for further requirements.

Attempting to initialize an already initialized condition variable results in undefined behavior.

In cases where default condition variable attributes are appropriate, the macro PTHREAD_COND_INITIALIZER can be used to initialize condition variables. The effect shall be equivalent to dynamic initialization by a call to *pthread_cond_init*( ) with parameter *attr* specified as NULL, except that no error checks are performed.

The behavior is undefined if the value specified by the *cond* argument to *pthread_cond_destroy*( ) does not refer to an initialized condition variable.

The behavior is undefined if the value specified by the *attr* argument to *pthread_cond_init*( ) does not refer to an initialized condition variable attributes object.

RETURN VALUE

If successful, the *pthread_cond_destroy*( ) and *pthread_cond_init*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_cond_init*( ) function shall fail if:

[EAGAIN] The system lacked the necessary resources (other than memory) to initialize another condition variable.

[ENOMEM] Insufficient memory exists to initialize the condition variable.

These functions shall not return an error code of [EINTR].

EXAMPLES

A condition variable can be destroyed immediately after all the threads that are blocked on it are awakened. For example, consider the following code:

```
struct list {
    pthread_mutex_t lm;
    ...
}

struct elt {
    key k;
    int busy;
    pthread_cond_t notbusy;
    ...
}

/* Find a list element and reserve it. */
struct elt *
list_find(struct list *lp, key k)
{
    struct elt *ep;

    pthread_mutex_lock(&lp->lm);
    while ((ep = find_elt(l, k) != NULL) && ep->busy)
        pthread_cond_wait(&ep->notbusy, &lp->lm);
    if (ep != NULL)
        ep->busy = 1;
    pthread_mutex_unlock(&lp->lm);
    return(ep);
}

delete_elt(struct list *lp, struct elt *ep)
{
    pthread_mutex_lock(&lp->lm);
    assert(ep->busy);
    ... remove ep from list ...
    ep->busy = 0;  /* Paranoid. */
(A) pthread_cond_broadcast(&ep->notbusy);
    pthread_mutex_unlock(&lp->lm);
(B) pthread_cond_destroy(&ep->notbusy);
    free(ep);
}
```

In this example, the condition variable and its list element may be freed (line B) immediately after all threads waiting for it are awakened (line A), since the mutex and the code ensure that no other thread can touch the element to be deleted.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *cond* argument to *pthread_cond_destroy*( ) does not refer to an initialized condition variable, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *cond* argument to

pthread_cond_destroy( ) or *pthread_cond_init*( ) refers to a condition variable that is in use (for example, in a *pthread_cond_wait*( ) call) by another thread, or detects that the value specified by the *cond* argument to *pthread_cond_init*( ) refers to an already initialized condition variable, it is recommended that the function should fail and report an [EBUSY] error.

If an implementation detects that the value specified by the *attr* argument to *pthread_cond_init*( ) does not refer to an initialized condition variable attributes object, it is recommended that the function should fail and report an [EINVAL] error.

See also *pthread_mutex_destroy*( ).

52730 **NAME**

52731 pthread_cond_signal — signal a condition

52732 **SYNOPSIS**

52733 `#include <pthread.h>`

52734 `int pthread_cond_signal(pthread_cond_t *cond);`

52735 **DESCRIPTION**

52736 Refer to *pthread_cond_broadcast( )*.

52737 **NAME**

52738 pthread_cond_timedwait, pthread_cond_wait — wait on a condition

52739 **SYNOPSIS**

52740
```
#include <pthread.h>
```

52741
```
int pthread_cond_timedwait(pthread_cond_t *restrict cond,
```
52742
```
    pthread_mutex_t *restrict mutex,
```
52743
```
    const struct timespec *restrict abstime);
```
52744
```
int pthread_cond_wait(pthread_cond_t *restrict cond,
```
52745
```
    pthread_mutex_t *restrict mutex);
```

52746 **DESCRIPTION**

52747 The *pthread_cond_timedwait*( ) and *pthread_cond_wait*( ) functions shall block on a condition
52748 variable. The application shall ensure that these functions are called with *mutex* locked by the
52749 calling thread; otherwise, an error (for PTHREAD_MUTEX_ERRORCHECK and robust
52750 mutexes) or undefined behavior (for other mutexes) results.

52751 These functions atomically release *mutex* and cause the calling thread to block on the condition
52752 variable *cond*; atomically here means ``atomically with respect to access by another thread to the
52753 mutex and then the condition variable''. That is, if another thread is able to acquire the mutex
52754 after the about-to-block thread has released it, then a subsequent call to *pthread_cond_broadcast*( )
52755 or *pthread_cond_signal*( ) in that thread shall behave as if it were issued after the about-to-block
52756 thread has blocked.

52757 Upon successful return, the mutex shall have been locked and shall be owned by the calling
52758 thread. If *mutex* is a robust mutex where an owner terminated while holding the lock and the
52759 state is recoverable, the mutex shall be acquired even though the function returns an error code.

52760 When using condition variables there is always a Boolean predicate involving shared variables
52761 associated with each condition wait that is true if the thread should proceed. Spurious wakeups
52762 from the *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ) functions may occur. Since the return
52763 from *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ) does not imply anything about the value of
52764 this predicate, the predicate should be re-evaluated upon such return.

52765 When a thread waits on a condition variable, having specified a particular mutex to either the
52766 *pthread_cond_timedwait*( ) or the *pthread_cond_wait*( ) operation, a dynamic binding is formed
52767 between that mutex and condition variable that remains in effect as long as at least one thread is
52768 blocked on the condition variable. During this time, the effect of an attempt by any thread to
52769 wait on that condition variable using a different mutex is undefined. Once all waiting threads
52770 have been unblocked (as by the *pthread_cond_broadcast*( ) operation), the next wait operation on
52771 that condition variable shall form a new dynamic binding with the mutex specified by that wait
52772 operation. Even though the dynamic binding between condition variable and mutex may be
52773 removed or replaced between the time a thread is unblocked from a wait on the condition
52774 variable and the time that it returns to the caller or begins cancellation cleanup, the unblocked
52775 thread shall always re-acquire the mutex specified in the condition wait operation call from
52776 which it is returning.

52777 A condition wait (whether timed or not) is a cancellation point. When the cancelability type of a
52778 thread is set to PTHREAD_CANCEL_DEFERRED, a side-effect of acting upon a cancellation
52779 request while in a condition wait is that the mutex is (in effect) re-acquired before calling the first
52780 cancellation cleanup handler. The effect is as if the thread were unblocked, allowed to execute up
52781 to the point of returning from the call to *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ), but at
52782 that point notices the cancellation request and instead of returning to the caller of
52783 *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ), starts the thread cancellation activities, which
52784 includes calling cancellation cleanup handlers.

A thread that has been unblocked because it has been canceled while blocked in a call to *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ) shall not consume any condition signal that may be directed concurrently at the condition variable if there are other threads blocked on the condition variable.

The *pthread_cond_timedwait*( ) function shall be equivalent to *pthread_cond_wait*( ), except that an error is returned if the absolute time specified by *abstime* passes (that is, system time equals or exceeds *abstime*) before the condition *cond* is signaled or broadcasted, or if the absolute time specified by *abstime* has already been passed at the time of the call. When such timeouts occur, *pthread_cond_timedwait*( ) shall nonetheless release and re-acquire the mutex referenced by *mutex*, and may consume a condition signal directed concurrently at the condition variable.

The condition variable shall have a clock attribute which specifies the clock that shall be used to measure the time specified by the *abstime* argument. The *pthread_cond_timedwait*( ) function is also a cancellation point.

If a signal is delivered to a thread waiting for a condition variable, upon return from the signal handler the thread resumes waiting for the condition variable as if it was not interrupted, or it shall return zero due to spurious wakeup.

The behavior is undefined if the value specified by the *cond* or *mutex* argument to these functions does not refer to an initialized condition variable or an initialized mutex object, respectively.

RETURN VALUE

Except for [ETIMEDOUT], [ENOTRECOVERABLE], and [EOWNERDEAD], all these error checks shall act as if they were performed immediately at the beginning of processing for the function and shall cause an error return, in effect, prior to modifying the state of the mutex specified by *mutex* or the condition variable specified by *cond*.

Upon successful completion, a value of zero shall be returned; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions shall fail if:

[ENOTRECOVERABLE]
: The state protected by the mutex is not recoverable.

[EOWNERDEAD]
: The mutex is a robust mutex and the process containing the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent.

[EPERM]
: The mutex type is PTHREAD_MUTEX_ERRORCHECK or the mutex is a robust mutex, and the current thread does not own the mutex.

The *pthread_cond_timedwait*( ) function shall fail if:

[ETIMEDOUT]
: The time specified by *abstime* to *pthread_cond_timedwait*( ) has passed.

[EINVAL]
: The *abstime* argument specified a nanosecond value less than zero or greater than or equal to 1000 million.

These functions may fail if:

[EOWNERDEAD]
The mutex is a robust mutex and the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications that have assumed that non-zero return values are errors will need updating for use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If an application is supposed to work with normal and robust mutexes, it should check all return values for error conditions and if necessary take appropriate action.

RATIONALE

If an implementation detects that the value specified by the *cond* argument to *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ) does not refer to an initialized condition variable, or detects that the value specified by the *mutex* argument to *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ) does not refer to an initialized mutex object, it is recommended that the function should fail and report an [EINVAL] error.

Condition Wait Semantics

It is important to note that when *pthread_cond_wait*( ) and *pthread_cond_timedwait*( ) return without error, the associated predicate may still be false. Similarly, when *pthread_cond_timedwait*( ) returns with the timeout error, the associated predicate may be true due to an unavoidable race between the expiration of the timeout and the predicate state change.

The application needs to recheck the predicate on any return because it cannot be sure there is another thread waiting on the thread to handle the signal, and if there is not then the signal is lost. The burden is on the application to check the predicate.

Some implementations, particularly on a multi-processor, may sometimes cause multiple threads to wake up when the condition variable is signaled simultaneously on different processors.

In general, whenever a condition wait returns, the thread has to re-evaluate the predicate associated with the condition wait to determine whether it can safely proceed, should wait again, or should declare a timeout. A return from the wait does not imply that the associated predicate is either true or false.

It is thus recommended that a condition wait be enclosed in the equivalent of a ``while loop'' that checks the predicate.

Timed Wait Semantics

An absolute time measure was chosen for specifying the timeout parameter for two reasons. First, a relative time measure can be easily implemented on top of a function that specifies absolute time, but there is a race condition associated with specifying an absolute timeout on top of a function that specifies relative timeouts. For example, assume that *clock_gettime*( ) returns the current time and *cond_relative_timed_wait*( ) uses relative timeouts:

```
clock_gettime(CLOCK_REALTIME, &now)
reltime = sleep_til_this_absolute_time –now;
cond_relative_timed_wait(c, m, &reltime);
```

If the thread is preempted between the first statement and the last statement, the thread blocks for too long. Blocking, however, is irrelevant if an absolute timeout is used. An absolute timeout also need not be recomputed if it is used multiple times in a loop, such as that enclosing a condition wait.

For cases when the system clock is advanced discontinuously by an operator, it is expected that implementations process any timed wait expiring at an intervening time as if that time had actually occurred.

Cancellation and Condition Wait

A condition wait, whether timed or not, is a cancellation point. That is, the functions *pthread_cond_wait*( ) or *pthread_cond_timedwait*( ) are points where a pending (or concurrent) cancellation request is noticed. The reason for this is that an indefinite wait is possible at these points—whatever event is being waited for, even if the program is totally correct, might never occur; for example, some input data being awaited might never be sent. By making condition wait a cancellation point, the thread can be canceled and perform its cancellation cleanup handler even though it may be stuck in some indefinite wait.

A side-effect of acting on a cancellation request while a thread is blocked on a condition variable is to re-acquire the mutex before calling any of the cancellation cleanup handlers. This is done in order to ensure that the cancellation cleanup handler is executed in the same state as the critical code that lies both before and after the call to the condition wait function. This rule is also required when interfacing to POSIX threads from languages, such as Ada or C++, which may choose to map cancellation onto a language exception; this rule ensures that each exception handler guarding a critical section can always safely depend upon the fact that the associated mutex has already been locked regardless of exactly where within the critical section the exception was raised. Without this rule, there would not be a uniform rule that exception handlers could follow regarding the lock, and so coding would become very cumbersome.

Therefore, since *some* statement has to be made regarding the state of the lock when a cancellation is delivered during a wait, a definition has been chosen that makes application coding most convenient and error free.

When acting on a cancellation request while a thread is blocked on a condition variable, the implementation is required to ensure that the thread does not consume any condition signals directed at that condition variable if there are any other threads waiting on that condition variable. This rule is specified in order to avoid deadlock conditions that could occur if these two independent requests (one acting on a thread and the other acting on the condition variable) were not processed independently.

52907 **Performance of Mutexes and Condition Variables**

52908 Mutexes are expected to be locked only for a few instructions. This practice is almost
52909 automatically enforced by the desire of programmers to avoid long serial regions of execution
52910 (which would reduce total effective parallelism).

52911 When using mutexes and condition variables, one tries to ensure that the usual case is to lock the
52912 mutex, access shared data, and unlock the mutex. Waiting on a condition variable should be a
52913 relatively rare situation. For example, when implementing a read-write lock, code that acquires a
52914 read-lock typically needs only to increment the count of readers (under mutual-exclusion) and
52915 return. The calling thread would actually wait on the condition variable only when there is
52916 already an active writer. So the efficiency of a synchronization operation is bounded by the cost
52917 of mutex lock/unlock and not by condition wait. Note that in the usual case there is no context
52918 switch.

52919 This is not to say that the efficiency of condition waiting is unimportant. Since there needs to be
52920 at least one context switch per Ada rendezvous, the efficiency of waiting on a condition variable
52921 is important. The cost of waiting on a condition variable should be little more than the minimal
52922 cost for a context switch plus the time to unlock and lock the mutex.

52923 **Features of Mutexes and Condition Variables**

52924 It had been suggested that the mutex acquisition and release be decoupled from condition wait.
52925 This was rejected because it is the combined nature of the operation that, in fact, facilitates
52926 realtime implementations. Those implementations can atomically move a high-priority thread
52927 between the condition variable and the mutex in a manner that is transparent to the caller. This
52928 can prevent extra context switches and provide more deterministic acquisition of a mutex when
52929 the waiting thread is signaled. Thus, fairness and priority issues can be dealt with directly by the
52930 scheduling discipline. Furthermore, the current condition wait operation matches existing
52931 practice.

52932 **Scheduling Behavior of Mutexes and Condition Variables**

52933 Synchronization primitives that attempt to interfere with scheduling policy by specifying an
52934 ordering rule are considered undesirable. Threads waiting on mutexes and condition variables
52935 are selected to proceed in an order dependent upon the scheduling policy rather than in some
52936 fixed order (for example, FIFO or priority). Thus, the scheduling policy determines which
52937 thread(s) are awakened and allowed to proceed.

52938 **Timed Condition Wait**

52939 The *pthread_cond_timedwait*( ) function allows an application to give up waiting for a particular
52940 condition after a given amount of time. An example of its use follows:

```
52941 (void) pthread_mutex_lock(&t.mn);
52942     t.waiters++;
52943     clock_gettime(CLOCK_REALTIME, &ts);
52944     ts.tv_sec += 5;
52945     rc = 0;
52946     while (! mypredicate(&t) && rc == 0)
52947         rc = pthread_cond_timedwait(&t.cond, &t.mn, &ts);
52948     t.waiters--;
52949     if (rc == 0 || mypredicate(&t))
52950         setmystate(&t);
52951 (void) pthread_mutex_unlock(&t.mn);
```

By making the timeout parameter absolute, it does not need to be recomputed each time the program checks its blocking predicate. If the timeout was relative, it would have to be recomputed before each call. This would be especially difficult since such code would need to take into account the possibility of extra wakeups that result from extra broadcasts or signals on the condition variable that occur before either the predicate is true or the timeout is due.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_cond_timedwait*( ) and *pthread_cond_wait*( ) functions are marked as part of the Threads option.

The Open Group Corrigendum U021/9 is applied, correcting the prototype for the *pthread_cond_wait*( ) function.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for the Clock Selection option.

The ERRORS section has an additional case for [EPERM] in response to IEEE PASC Interpretation 1003.1c #28.

The **restrict** keyword is added to the *pthread_cond_timedwait*( ) and *pthread_cond_wait*( ) prototypes for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/89 is applied, updating the DESCRIPTION for consistency with the *pthread_cond_destroy*( ) function that states it is safe to destroy an initialized condition variable upon which no threads are currently blocked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/90 is applied, updating words in the DESCRIPTION from ``the cancelability enable state'' to ``the cancelability type''.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/91 is applied, updating the ERRORS section to remove the error case related to *abstime* from the *pthread_cond_wait*( ) function, and to make the error case related to *abstime* mandatory for *pthread_cond_timedwait*( ) for consistency with other functions.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/92 is applied, adding a new paragraph to the RATIONALE section stating that an application should check the predicate on any return from this function.

Issue 7

SD5-XSH-ERN-44 is applied, changing the definition of the ``shall fail'' case of the [EINVAL] error.

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

The *pthread_cond_timedwait*( ) and *pthread_cond_wait*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized condition variable or uninitialized mutex object is removed; this condition results in undefined behavior"

The [EPERM] error is revised and moved to the ``shall fail'' list of error conditions for the *pthread_cond_timedwait*( ) function.

The DESCRIPTION is updated to clarify the behavior when *mutex* is a robust mutex.

The ERRORS section is updated to include ``shall fail'' cases for PTHREAD_MUTEX_ERRORCHECK mutexes.

The DESCRIPTION is rewritten to clarify that undefined behavior occurs only for mutexes where the [EPERM] error is not mandated.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0456 [91,286,437] and XSH/TC1-2008/0457 [239] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0271 [749] is applied.

53005 **NAME**

53006 pthread_condattr_destroy, pthread_condattr_init — destroy and initialize the condition variable
53007 attributes object

53008 **SYNOPSIS**

53009 ```
#include <pthread.h>
```

53010 ```
int pthread_condattr_destroy(pthread_condattr_t *attr);
```
53011 ```
int pthread_condattr_init(pthread_condattr_t *attr);
```

53012 **DESCRIPTION**

53013 The *pthread_condattr_destroy*( ) function shall destroy a condition variable attributes object; the
53014 object becomes, in effect, uninitialized. An implementation may cause *pthread_condattr_destroy*( )
53015 to set the object referenced by *attr* to an invalid value. A destroyed *attr* attributes object can be
53016 reinitialized using *pthread_condattr_init*( ); the results of otherwise referencing the object after it
53017 has been destroyed are undefined.

53018 The *pthread_condattr_init*( ) function shall initialize a condition variable attributes object *attr* with
53019 the default value for all of the attributes defined by the implementation.

53020 Results are undefined if *pthread_condattr_init*( ) is called specifying an already initialized *attr*
53021 attributes object.

53022 After a condition variable attributes object has been used to initialize one or more condition
53023 variables, any function affecting the attributes object (including destruction) shall not affect any
53024 previously initialized condition variables.

53025 This volume of POSIX.1-2017 requires two attributes, the *clock* attribute and the *process-shared*
53026 attribute.

53027 Additional attributes, their default values, and the names of the associated functions to get and
53028 set those attribute values are implementation-defined.

53029 The behavior is undefined if the value specified by the *attr* argument to
53030 *pthread_condattr_destroy*( ) does not refer to an initialized condition variable attributes object.

53031 **RETURN VALUE**

53032 If successful, the *pthread_condattr_destroy*( ) and *pthread_condattr_init*( ) functions shall return
53033 zero; otherwise, an error number shall be returned to indicate the error.

53034 **ERRORS**

53035 The *pthread_condattr_init*( ) function shall fail if:

53036 [ENOMEM] Insufficient memory exists to initialize the condition variable attributes object.

53037 These functions shall not return an error code of [EINTR].

53038 **EXAMPLES**

53039 None.

53040 **APPLICATION USAGE**

53041 None.

53042 **RATIONALE**

53043 A *process-shared* attribute has been defined for condition variables for the same reason it has been
53044 defined for mutexes.

53045 If an implementation detects that the value specified by the *attr* argument to
53046 *pthread_condattr_destroy*( ) does not refer to an initialized condition variable attributes object, it is
53047 recommended that the function should fail and report an [EINVAL] error.

  
```

See also *pthread_attr_destroy( )* and *pthread_mutex_destroy( )*.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_condattr_destroy*( ) and *pthread_condattr_init*( ) functions are marked as part of the Threads option.

Issue 7

The *pthread_condattr_destroy*( ) and *pthread_condattr_init*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized condition variable attributes object is removed; this condition results in undefined behavior.

53065 **NAME**

53066 pthread_condattr_getclock, pthread_condattr_setclock — get and set the clock selection
53067 condition variable attribute

53068 **SYNOPSIS**

53069 ```
#include <pthread.h>

int pthread_condattr_getclock(const pthread_condattr_t *restrict attr,
    clockid_t *restrict clock_id);
int pthread_condattr_setclock(pthread_condattr_t *attr,
    clockid_t clock_id);
```

53074 **DESCRIPTION**

53075 The *pthread_condattr_getclock*( ) function shall obtain the value of the *clock* attribute from the
53076 attributes object referenced by *attr*.

53077 The *pthread_condattr_setclock*( ) function shall set the *clock* attribute in an initialized attributes
53078 object referenced by *attr*. If *pthread_condattr_setclock*( ) is called with a *clock_id* argument that
53079 refers to a CPU-time clock, the call shall fail.

53080 The *clock* attribute is the clock ID of the clock that shall be used to measure the timeout service of
53081 *pthread_cond_timedwait*( ). The default value of the *clock* attribute shall refer to the system clock.

53082 The behavior is undefined if the value specified by the *attr* argument to
53083 *pthread_condattr_getclock*( ) or *pthread_condattr_setclock*( ) does not refer to an initialized condition
53084 variable attributes object.

53085 **RETURN VALUE**

53086 If successful, the *pthread_condattr_getclock*( ) function shall return zero and store the value of the
53087 clock attribute of *attr* into the object referenced by the *clock_id* argument. Otherwise, an error
53088 number shall be returned to indicate the error.

53089 If successful, the *pthread_condattr_setclock*( ) function shall return zero; otherwise, an error
53090 number shall be returned to indicate the error.

53091 **ERRORS**

53092 The *pthread_condattr_setclock*( ) function may fail if:

53093 [EINVAL] The value specified by *clock_id* does not refer to a known clock, or is a CPU-
53094 time clock.

53095 These functions shall not return an error code of [EINTR].

53096 **EXAMPLES**

53097 None.

53098 **APPLICATION USAGE**

53099 None.

53100 **RATIONALE**

53101 If an implementation detects that the value specified by the *attr* argument to
53102 *pthread_condattr_getclock*( ) or *pthread_condattr_setclock*( ) does not refer to an initialized condition
53103 variable attributes object, it is recommended that the function should fail and report an
53104 [EINVAL] error.

53105 **FUTURE DIRECTIONS**

53106 None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

Issue 7

The *pthread_condattr_getclock*( ) and *pthread_condattr_setclock*( ) functions are moved from the Clock Selection option to the Base.

The [EINVAL] error for an uninitialized condition variable attributes object is removed; this condition results in undefined behavior.

53118 **NAME**

53119 pthread_condattr_getpshared, pthread_condattr_setpshared ‡' get and set the process-shared
53120 condition variable attributes

53121 **SYNOPSIS**

53122 TSH
```
#include <pthread.h>

int pthread_condattr_getpshared(const pthread_condattr_t *restrict attr,
    int *restrict pshared);
int pthread_condattr_setpshared(pthread_condattr_t *attr,
    int pshared);
```

53127 **DESCRIPTION**

53128 The *pthread_condattr_getpshared*( ) function shall obtain the value of the *process-shared* attribute
53129 from the attributes object referenced by *attr*.

53130 The *pthread_condattr_setpshared*( ) function shall set the *process-shared* attribute in an initialized
53131 attributes object referenced by *attr*.

53132 The *process-shared* attribute is set to PTHREAD_PROCESS_SHARED to permit a condition
53133 variable to be operated upon by any thread that has access to the memory where the condition
53134 variable is allocated, even if the condition variable is allocated in memory that is shared by
53135 multiple processes. See Section 2.9.9 (on page 523) for further requirements. The default value of
53136 the attribute is PTHREAD_PROCESS_PRIVATE.

53137 The behavior is undefined if the value specified by the *attr* argument to
53138 *pthread_condattr_getpshared*( ) or *pthread_condattr_setpshared*( ) does not refer to an initialized
53139 condition variable attributes object.

53140 **RETURN VALUE**

53141 If successful, the *pthread_condattr_setpshared*( ) function shall return zero; otherwise, an error
53142 number shall be returned to indicate the error.

53143 If successful, the *pthread_condattr_getpshared*( ) function shall return zero and store the value of
53144 the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise,
53145 an error number shall be returned to indicate the error.

53146 **ERRORS**

53147 The *pthread_condattr_setpshared*( ) function may fail if:

53148 [EINVAL] The new value specified for the attribute is outside the range of legal values
53149 for that attribute.

53150 These functions shall not return an error code of [EINTR].

53151 **EXAMPLES**

53152 None.

53153 **APPLICATION USAGE**

53154 None.

53155 **RATIONALE**

53156 If an implementation detects that the value specified by the *attr* argument to
53157 *pthread_condattr_getpshared*( ) or *pthread_condattr_setpshared*( ) does not refer to an initialized
53158 condition variable attributes object, it is recommended that the function should fail and report
53159 an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_condattr_getpshared*( ) and *pthread_condattr_setpshared*( ) functions are marked as part of the Threads and Thread Process-Shared Synchronization options.

The **restrict** keyword is added to the *pthread_condattr_getpshared*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *pthread_condattr_getpshared*( ) and *pthread_condattr_setpshared*( ) functions are marked only as part of the Thread Process-Shared Synchronization option as the Threads option is now part of the Base.

The [EINVAL] error for an uninitialized condition variable attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0272 [972] and XSH/TC2-2008/0273 [757] are applied.

53180 **NAME**

53181 pthread_condattr_init — initialize the condition variable attributes object

53182 **SYNOPSIS**

53183 `#include <pthread.h>`

53184 `int pthread_condattr_init(pthread_condattr_t *attr);`

53185 **DESCRIPTION**

53186 Refer to *pthread_condattr_destroy( )*.

53187 **NAME**

53188 pthread_condattr_setclock — set the clock selection condition variable attribute

53189 **SYNOPSIS**

53190 ```
#include <pthread.h>
```

53191 ```
int pthread_condattr_setclock(pthread_condattr_t *attr,
```

53192 ```
    clockid_t clock_id);
```

53193 **DESCRIPTION**

53194 Refer to *pthread_condattr_getclock( )*.

  
```

NAME

pthread_condattr_setpshared — set the process-shared condition variable attribute

SYNOPSIS

TSH

```
#include <pthread.h>

int pthread_condattr_setpshared(pthread_condattr_t *attr,
    int pshared);
```

DESCRIPTION

Refer to *pthread_condattr_getpshared*( ).

53203 **NAME**

53204 pthread_create — thread creation

53205 **SYNOPSIS**

53206 ```
#include <pthread.h>
```

53207 ```
int pthread_create(pthread_t *restrict thread,
```

53208 ```
    const pthread_attr_t *restrict attr,
```

53209 ```
    void *(*start_routine)(void*), void *restrict arg);
```

53210 **DESCRIPTION**

53211 The *pthread_create*( ) function shall create a new thread, with attributes specified by *attr*, within a
53212 process. If *attr* is NULL, the default attributes shall be used. If the attributes specified by *attr* are
53213 modified later, the thread's attributes shall not be affected. Upon successful completion,
53214 *pthread_create*( ) shall store the ID of the created thread in the location referenced by *thread*.

53215 The thread is created executing *start_routine* with *arg* as its sole argument. If the *start_routine*
53216 returns, the effect shall be as if there was an implicit call to *pthread_exit*( ) using the return value
53217 of *start_routine* as the exit status. Note that the thread in which *main*( ) was originally invoked
53218 differs from this. When it returns from *main*( ), the effect shall be as if there was an implicit call to
53219 *exit*( ) using the return value of *main*( ) as the exit status.

53220 The signal state of the new thread shall be initialized as follows:

53221 The signal mask shall be inherited from the creating thread.

53222 The set of signals pending for the new thread shall be empty.

53223 XSI The thread-local current locale and the alternate stack shall not be inherited.

53224 The floating-point environment shall be inherited from the creating thread.

53225 If *pthread_create*( ) fails, no new thread is created and the contents of the location referenced by
53226 *thread* are undefined.

53227 TCT If _POSIX_THREAD_CPUTIME is defined, the new thread shall have a CPU-time clock
53228 accessible, and the initial value of this clock shall be set to zero.

53229 The behavior is undefined if the value specified by the *attr* argument to *pthread_create*( ) does not
53230 refer to an initialized thread attributes object.

53231 **RETURN VALUE**

53232 If successful, the *pthread_create*( ) function shall return zero; otherwise, an error number shall be
53233 returned to indicate the error.

53234 **ERRORS**

53235 The *pthread_create*( ) function shall fail if:

53236 [EAGAIN] The system lacked the necessary resources to create another thread, or the
53237 system-imposed limit on the total number of threads in a process
53238 {PTHREAD_THREADS_MAX} would be exceeded.

53239 [EPERM] The caller does not have appropriate privileges to set the required scheduling
53240 parameters or scheduling policy.

53241 The *pthread_create*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

There is no requirement on the implementation that the ID of the created thread be available before the newly created thread starts executing. The calling thread can obtain the ID of the created thread through the *thread* argument of the *pthread_create*( ) function, and the newly created thread can obtain its ID by a call to *pthread_self*( ).

RATIONALE

A suggested alternative to *pthread_create*( ) would be to define two separate operations: create and start. Some applications would find such behavior more natural. Ada, in particular, separates the ``creation'' of a task from its ``activation''.

Splitting the operation was rejected by the standard developers for many reasons:

> The number of calls required to start a thread would increase from one to two and thus place an additional burden on applications that do not require the additional synchronization. The second call, however, could be avoided by the additional complication of a start-up state attribute.
>
> An extra state would be introduced: ``created but not started''. This would require the standard to specify the behavior of the thread operations when the target has not yet started executing.
>
> For those applications that require such behavior, it is possible to simulate the two separate steps with the facilities that are currently provided. The *start_routine*( ) can synchronize by waiting on a condition variable that is signaled by the start operation.

An Ada implementor can choose to create the thread at either of two points in the Ada program: when the task object is created, or when the task is activated (generally at a ``begin''). If the first approach is adopted, the *start_routine*( ) needs to wait on a condition variable to receive the order to begin ``activation''. The second approach requires no such condition variable or extra synchronization. In either approach, a separate Ada task control block would need to be created when the task object is created to hold rendezvous queues, and so on.

An extension of the preceding model would be to allow the state of the thread to be modified between the create and start. This would allow the thread attributes object to be eliminated. This has been rejected because:

> All state in the thread attributes object has to be able to be set for the thread. This would require the definition of functions to modify thread attributes. There would be no reduction in the number of function calls required to set up the thread. In fact, for an application that creates all threads using identical attributes, the number of function calls required to set up the threads would be dramatically increased. Use of a thread attributes object permits the application to make one set of attribute setting function calls. Otherwise, the set of attribute setting function calls needs to be made for each thread creation.
>
> Depending on the implementation architecture, functions to set thread state would require kernel calls, or for other implementation reasons would not be able to be implemented as macros, thereby increasing the cost of thread creation.
>
> The ability for applications to segregate threads by class would be lost.

Another suggested alternative uses a model similar to that for process creation, such as ``thread fork''. The fork semantics would provide more flexibility and the ``create'' function can be implemented simply by doing a thread fork followed immediately by a call to the desired ``start

routine'' for the thread. This alternative has these problems:

For many implementations, the entire stack of the calling thread would need to be duplicated, since in many architectures there is no way to determine the size of the calling frame.

Efficiency is reduced since at least some part of the stack has to be copied, even though in most cases the thread never needs the copied context, since it merely calls the desired start routine.

If an implementation detects that the value specified by the *attr* argument to *pthread_create*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

XBD Section 4.12 (on page 111), **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_create*( ) function is marked as part of the Threads option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

The [EPERM] mandatory error condition is added.

The thread CPU-time clock semantics are added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread_create*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

The DESCRIPTION is updated to make it explicit that the floating-point environment is inherited from the creating thread.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/44 is applied, adding text that the alternate stack is not inherited.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/93 is applied, updating the ERRORS section to remove the mandatory [EINVAL] error (``The value specified by *attr* is invalid''), and adding the optional [EINVAL] error (``The attributes specified by *attr* are invalid'').

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/94 is applied, adding the APPLICATION USAGE section.

Issue 7

The *pthread_create*( ) function is moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0458 [302] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0274 [849] is applied.

53328 **NAME**

53329 pthread_detach — detach a thread

53330 **SYNOPSIS**

53331 `#include <pthread.h>`

53332 `int pthread_detach(pthread_t thread);`

53333 **DESCRIPTION**

53334 The *pthread_detach*( ) function shall indicate to the implementation that storage for the thread
53335 *thread* can be reclaimed when that thread terminates. If *thread* has not terminated,
53336 *pthread_detach*( ) shall not cause it to terminate.

53337 The behavior is undefined if the value specified by the *thread* argument to *pthread_detach*( ) does
53338 not refer to a joinable thread.

53339 **RETURN VALUE**

53340 If the call succeeds, *pthread_detach*( ) shall return 0; otherwise, an error number shall be returned
53341 to indicate the error.

53342 **ERRORS**

53343 The *pthread_detach*( ) function shall not return an error code of [EINTR].

53344 **EXAMPLES**

53345 None.

53346 **APPLICATION USAGE**

53347 None.

53348 **RATIONALE**

53349 The *pthread_join*( ) or *pthread_detach*( ) functions should eventually be called for every thread that
53350 is created so that storage associated with the thread may be reclaimed.

53351 It has been suggested that a ``detach'' function is not necessary; the *detachstate* thread creation
53352 attribute is sufficient, since a thread need never be dynamically detached. However, need arises
53353 in at least two cases:

53354 1. In a cancellation handler for a *pthread_join*( ) it is nearly essential to have a
53355 *pthread_detach*( ) function in order to detach the thread on which *pthread_join*( ) was
53356 waiting. Without it, it would be necessary to have the handler do another *pthread_join*( ) to
53357 attempt to detach the thread, which would both delay the cancellation processing for an
53358 unbounded period and introduce a new call to *pthread_join*( ), which might itself need a
53359 cancellation handler. A dynamic detach is nearly essential in this case.

53360 2. In order to detach the ``initial thread'' (as may be desirable in processes that set up server
53361 threads).

53362 If an implementation detects that the value specified by the *thread* argument to *pthread_detach*( )
53363 does not refer to a joinable thread, it is recommended that the function should fail and report an
53364 [EINVAL] error.

53365 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended
53366 that the function should fail and report an [ESRCH] error.

53367 **FUTURE DIRECTIONS**

53368 None.

53373 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

53374 **Issue 6**

53375 The *pthread_detach( )* function is marked as part of the Threads option.

53376 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/95 is applied, updating the ERRORS
53377 section so that the [EINVAL] and [ESRCH] error cases become optional.

53378 **Issue 7**

53379 The *pthread_detach( )* function is moved from the Threads option to the Base.

53380 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

53381 The [EINVAL] error for a non-joinable thread is removed; this condition results in undefined
53382 behavior.

NAME

pthread_equal — compare thread IDs

SYNOPSIS

```
#include <pthread.h>

int pthread_equal(pthread_t t1, pthread_t t2);
```

DESCRIPTION

This function shall compare the thread IDs *t1* and *t2*.

RETURN VALUE

The *pthread_equal*( ) function shall return a non-zero value if *t1* and *t2* are equal; otherwise, zero shall be returned.

If either *t1* or *t2* are not valid thread IDs, the behavior is undefined.

ERRORS

No errors are defined.

The *pthread_equal*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Implementations may choose to define a thread ID as a structure. This allows additional flexibility and robustness over using an **int**. For example, a thread ID could include a sequence number that allows detection of ``dangling IDs'' (copies of a thread ID that has been detached). Since the C language does not support comparison on structure types, the *pthread_equal*( ) function is provided to compare thread IDs.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_create( ), *pthread_self*( )

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_equal*( ) function is marked as part of the Threads option.

Issue 7

The *pthread_equal*( ) function is moved from the Threads option to the Base.

53418 **NAME**

53419 pthread_exit — thread termination

53420 **SYNOPSIS**

53421 `#include <pthread.h>`

53422 `void pthread_exit(void *value_ptr);`

53423 **DESCRIPTION**

53424 The *pthread_exit*( ) function shall terminate the calling thread and make the value *value_ptr*
53425 available to any successful join with the terminating thread. Any cancellation cleanup handlers
53426 that have been pushed and not yet popped shall be popped in the reverse order that they were
53427 pushed and then executed. After all cancellation cleanup handlers have been executed, if the
53428 thread has any thread-specific data, appropriate destructor functions shall be called in an
53429 unspecified order. Thread termination does not release any application visible process resources,
53430 including, but not limited to, mutexes and file descriptors, nor does it perform any process-level
53431 cleanup actions, including, but not limited to, calling any *atexit*( ) routines that may exist.

53432 An implicit call to *pthread_exit*( ) is made when a thread other than the thread in which *main*( )
53433 was first invoked returns from the start routine that was used to create it. The function's return
53434 value shall serve as the thread's exit status.

53435 The behavior of *pthread_exit*( ) is undefined if called from a cancellation cleanup handler or
53436 destructor function that was invoked as a result of either an implicit or explicit call to
53437 *pthread_exit*( ).

53438 After a thread has terminated, the result of access to local (auto) variables of the thread is
53439 undefined. Thus, references to local variables of the exiting thread should not be used for the
53440 *pthread_exit*( ) *value_ptr* parameter value.

53441 The process shall exit with an exit status of 0 after the last thread has been terminated. The
53442 behavior shall be as if the implementation called *exit*( ) with a zero argument at thread
53443 termination time.

53444 **RETURN VALUE**

53445 The *pthread_exit*( ) function cannot return to its caller.

53446 **ERRORS**

53447 No errors are defined.

53448 **EXAMPLES**

53449 None.

53450 **APPLICATION USAGE**

53451 None.

53452 **RATIONALE**

53453 The normal mechanism by which a thread terminates is to return from the routine that was
53454 specified in the *pthread_create*( ) call that started it. The *pthread_exit*( ) function provides the
53455 capability for a thread to terminate without requiring a return from the start routine of that
53456 thread, thereby providing a function analogous to *exit*( ).

53457 Regardless of the method of thread termination, any cancellation cleanup handlers that have
53458 been pushed and not yet popped are executed, and the destructors for any existing thread-
53459 specific data are executed. This volume of POSIX.1-2017 requires that cancellation cleanup
53460 handlers be popped and called in order. After all cancellation cleanup handlers have been
53461 executed, thread-specific data destructors are called, in an unspecified order, for each item of
53462 thread-specific data that exists in the thread. This ordering is necessary because cancellation
53463 cleanup handlers may rely on thread-specific data.

As the meaning of the status is determined by the application (except when the thread has been canceled, in which case it is PTHREAD_CANCELED), the implementation has no idea what an illegal status value is, which is why no address error checking is done.

FUTURE DIRECTIONS

None.

Issue 7

The *pthread_exit*( ) function is moved from the Threads option to the Base.

NAME

pthread_getconcurrency, pthread_setconcurrency — get and set the level of concurrency

SYNOPSIS

OB XSI
```
#include <pthread.h>

int pthread_getconcurrency(void);
int pthread_setconcurrency(int new_level);
```

DESCRIPTION

Unbound threads in a process may or may not be required to be simultaneously active. By default, the threads implementation ensures that a sufficient number of threads are active so that the process can continue to make progress. While this conserves system resources, it may not produce the most effective level of concurrency.

The *pthread_setconcurrency*( ) function allows an application to inform the threads implementation of its desired concurrency level, *new_level*. The actual level of concurrency provided by the implementation as a result of this function call is unspecified.

If *new_level* is zero, it causes the implementation to maintain the concurrency level at its discretion as if *pthread_setconcurrency*( ) had never been called.

The *pthread_getconcurrency*( ) function shall return the value set by a previous call to the *pthread_setconcurrency*( ) function. If the *pthread_setconcurrency*( ) function was not previously called, this function shall return zero to indicate that the implementation is maintaining the concurrency level.

A call to *pthread_setconcurrency*( ) shall inform the implementation of its desired concurrency level. The implementation shall use this as a hint, not a requirement.

If an implementation does not support multiplexing of user threads on top of several kernel-scheduled entities, the *pthread_setconcurrency*( ) and *pthread_getconcurrency*( ) functions are provided for source code compatibility but they shall have no effect when called. To maintain the function semantics, the *new_level* parameter is saved when *pthread_setconcurrency*( ) is called so that a subsequent call to *pthread_getconcurrency*( ) shall return the same value.

RETURN VALUE

If successful, the *pthread_setconcurrency*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

The *pthread_getconcurrency*( ) function shall always return the concurrency level set by a previous call to *pthread_setconcurrency*( ). If the *pthread_setconcurrency*( ) function has never been called, *pthread_getconcurrency*( ) shall return zero.

ERRORS

The *pthread_setconcurrency*( ) function shall fail if:

[EINVAL] The value specified by *new_level* is negative.

[EAGAIN] The value specified by *new_level* would cause a system resource to be exceeded.

The *pthread_setconcurrency*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Application developers should note that an implementation can always ignore any calls to *pthread_setconcurrency*( ) and return a constant for *pthread_getconcurrency*( ). For this reason, it is not recommended that portable applications use this function.

RATIONALE

None.

FUTURE DIRECTIONS

These functions may be removed in a future version.

The *pthread_getconcurrency*( ) and *pthread_setconcurrency*( ) functions are marked obsolescent.

NAME

pthread_getcpuclockid — access a thread CPU-time clock (**ADVANCED REALTIME THREADS**)

SYNOPSIS

TCT
```
#include <pthread.h>
#include <time.h>

int pthread_getcpuclockid(pthread_t thread_id, clockid_t *clock_id);
```

DESCRIPTION

The *pthread_getcpuclockid*( ) function shall return in *clock_id* the clock ID of the CPU-time clock of the thread specified by *thread_id*, if the thread specified by *thread_id* exists.

RETURN VALUE

Upon successful completion, *pthread_getcpuclockid*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *pthread_getcpuclockid*( ) function is part of the Thread CPU-Time Clocks option and need not be provided on all implementations.

RATIONALE

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended that the function should fail and report an [ESRCH] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

Issue 7

The *pthread_getcpuclockid*( ) function is marked only as part of the Thread CPU-Time Clocks option as the Threads option is now part of the Base.

Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0275 [757] is applied.

NAME

pthread_getschedparam, pthread_setschedparam — dynamic thread scheduling parameters access (**REALTIME THREADS**)

SYNOPSIS

TPS
```
#include <pthread.h>

int pthread_getschedparam(pthread_t thread, int *restrict policy,
    struct sched_param *restrict param);
int pthread_setschedparam(pthread_t thread, int policy,
    const struct sched_param *param);
```

DESCRIPTION

The *pthread_getschedparam*( ) and *pthread_setschedparam*( ) functions shall, respectively, get and set the scheduling policy and parameters of individual threads within a multi-threaded process to be retrieved and set. For SCHED_FIFO and SCHED_RR, the only required member of the **sched_param** structure is the priority *sched_priority*. For SCHED_OTHER, the affected scheduling parameters are implementation-defined.

The *pthread_getschedparam*( ) function shall retrieve the scheduling policy and scheduling parameters for the thread whose thread ID is given by *thread* and shall store those values in *policy* and *param*, respectively. The priority value returned from *pthread_getschedparam*( ) shall be the value specified by the most recent *pthread_setschedparam*( ), *pthread_setschedprio*( ), or *pthread_create*( ) call affecting the target thread. It shall not reflect any temporary adjustments to its priority as a result of any priority inheritance or ceiling functions. The *pthread_setschedparam*( ) function shall set the scheduling policy and associated scheduling parameters for the thread whose thread ID is given by *thread* to the policy and associated parameters provided in *policy* and *param*, respectively.

The *policy* parameter may have the value SCHED_OTHER, SCHED_FIFO, or SCHED_RR. The scheduling parameters for the SCHED_OTHER policy are implementation-defined. The SCHED_FIFO and SCHED_RR policies shall have a single scheduling parameter, *priority*.

TSP If _POSIX_THREAD_SPORADIC_SERVER is defined, then the *policy* argument may have the value SCHED_SPORADIC, with the exception for the *pthread_setschedparam*( ) function that if the scheduling policy was not SCHED_SPORADIC at the time of the call, it is implementation-defined whether the function is supported; in other words, the implementation need not allow the application to dynamically change the scheduling policy to SCHED_SPORADIC. The sporadic server scheduling policy has the associated parameters *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, *sched_priority*, and *sched_ss_max_repl*. The specified *sched_ss_repl_period* shall be greater than or equal to the specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail. The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

If the *pthread_setschedparam*( ) function fails, the scheduling parameters shall not be changed for the target thread.

RETURN VALUE

If successful, the *pthread_getschedparam*( ) and *pthread_setschedparam*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

53615 **ERRORS**

53616 The *pthread_setschedparam*( ) function shall fail if:

53617 [ENOTSUP] An attempt was made to set the policy or scheduling parameters to an
53618 unsupported value.

53619 TSP [ENOTSUP] An attempt was made to dynamically change the scheduling policy to
53620 SCHED_SPORADIC, and the implementation does not support this change.

53621 The *pthread_setschedparam*( ) function may fail if:

53622 [EINVAL] The value specified by *policy* or one of the scheduling parameters associated
53623 with the scheduling policy *policy* is invalid.

53624 [EPERM] The caller does not have appropriate privileges to set either the scheduling
53625 parameters or the scheduling policy of the specified thread.

53626 [EPERM] The implementation does not allow the application to modify one of the
53627 parameters to the value specified.

53628 These functions shall not return an error code of [EINTR].

53629 **EXAMPLES**

53630 None.

53631 **APPLICATION USAGE**

53632 None.

53633 **RATIONALE**

53634 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended
53635 that the function should fail and report an [ESRCH] error.

53636 **FUTURE DIRECTIONS**

53637 None.

53638 **SEE ALSO**

53639 *pthread_setschedprio*( ), *sched_getparam*( ), *sched_getscheduler*( )

53640 XBD **<pthread.h>**, **<sched.h>**

53641 **CHANGE HISTORY**

53642 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

53643 **Issue 6**

53644 The *pthread_getschedparam*( ) and *pthread_setschedparam*( ) functions are marked as part of the
53645 Threads and Thread Execution Scheduling options.

53646 The [ENOSYS] error condition has been removed as stubs need not be provided if an
53647 implementation does not support the Thread Execution Scheduling option.

53648 The Open Group Corrigendum U026/2 is applied, correcting the prototype for the
53649 *pthread_setschedparam*( ) function so that its second argument is of type **int**.

53650 The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

53651 The **restrict** keyword is added to the *pthread_getschedparam*( ) prototype for alignment with the
53652 ISO/IEC 9899:1999 standard.

53653 The Open Group Corrigendum U047/1 is applied.

53654 IEEE PASC Interpretation 1003.1 #96 is applied, noting that priority values can also be set by a
53655 call to the *pthread_setschedprio*( ) function.

Issue 7

The *pthread_getschedparam*( ) and *pthread_setschedparam*( ) functions are marked only as part of the Thread Execution Scheduling option as the Threads option is now part of the Base.

Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements for the *sched_ss_repl_period* and *sched_ss_init_budget* values.

Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0459 [314] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0276 [757] is applied.

53664 **NAME**

53665 pthread_getspecific, pthread_setspecific — thread-specific data management

53666 **SYNOPSIS**

53667 ```
#include <pthread.h>

void *pthread_getspecific(pthread_key_t key);
int pthread_setspecific(pthread_key_t key, const void *value);
```

53670 **DESCRIPTION**

53671 The *pthread_getspecific*( ) function shall return the value currently bound to the specified *key* on
53672 behalf of the calling thread.

53673 The *pthread_setspecific*( ) function shall associate a thread-specific *value* with a *key* obtained via a
53674 previous call to *pthread_key_create*( ). Different threads may bind different values to the same
53675 key. These values are typically pointers to blocks of dynamically allocated memory that have
53676 been reserved for use by the calling thread.

53677 The effect of calling *pthread_getspecific*( ) or *pthread_setspecific*( ) with a *key* value not obtained
53678 from *pthread_key_create*( ) or after *key* has been deleted with *pthread_key_delete*( ) is undefined.

53679 Both *pthread_getspecific*( ) and *pthread_setspecific*( ) may be called from a thread-specific data
53680 destructor function. A call to *pthread_getspecific*( ) for the thread-specific data key being
53681 destroyed shall return the value NULL, unless the value is changed (after the destructor starts)
53682 by a call to *pthread_setspecific*( ). Calling *pthread_setspecific*( ) from a thread-specific data
53683 destructor routine may result either in lost storage (after at least
53684 PTHREAD_DESTRUCTOR_ITERATIONS attempts at destruction) or in an infinite loop.

53685 Both functions may be implemented as macros.

53686 **RETURN VALUE**

53687 The *pthread_getspecific*( ) function shall return the thread-specific data value associated with the
53688 given *key*. If no thread-specific data value is associated with *key*, then the value NULL shall be
53689 returned.

53690 If successful, the *pthread_setspecific*( ) function shall return zero; otherwise, an error number shall
53691 be returned to indicate the error.

53692 **ERRORS**

53693 No errors are returned from *pthread_getspecific*( ).

53694 The *pthread_setspecific*( ) function shall fail if:

53695 [ENOMEM] Insufficient memory exists to associate the non-NULL value with the key.

53696 The *pthread_setspecific*( ) function shall not return an error code of [EINTR].

53697 **EXAMPLES**

53698 None.

53699 **APPLICATION USAGE**

53700 None.

53701 **RATIONALE**

53702 Performance and ease-of-use of *pthread_getspecific*( ) are critical for functions that rely on
53703 maintaining state in thread-specific data. Since no errors are required to be detected by it, and
53704 since the only error that could be detected is the use of an invalid key, the function to
53705 *pthread_getspecific*( ) has been designed to favor speed and simplicity over error reporting.

53706 If an implementation detects that the value specified by the *key* argument to *pthread_setspecific*( )
53707 does not refer to a a key value obtained from *pthread_key_create*( ) or refers to a key that has been

  
```

deleted with *pthread_key_delete*( ), it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_key_create( )

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_getspecific*( ) and *pthread_setspecific*( ) functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1c #3 (Part 6) is applied, updating the DESCRIPTION.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/96 is applied, updating the ERRORS section so that the [ENOMEM] error case is changed from ``to associate the value with the key'' to ``to associate the non-NULL value with the key''.

Issue 7

Austin Group Interpretation 1003.1-2001 #063 is applied, updating the ERRORS section.

The *pthread_getspecific*( ) and *pthread_setspecific*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for a key value not obtained from *pthread_key_create*( ) or a key deleted with *pthread_key_delete*( ) is removed; this condition results in undefined behavior.

NAME

pthread_join — wait for thread termination

SYNOPSIS

```
#include <pthread.h>

int pthread_join(pthread_t thread, void **value_ptr);
```

DESCRIPTION

The *pthread_join*( ) function shall suspend execution of the calling thread until the target *thread* terminates, unless the target *thread* has already terminated. On return from a successful *pthread_join*( ) call with a non-NULL *value_ptr* argument, the value passed to *pthread_exit*( ) by the terminating thread shall be made available in the location referenced by *value_ptr*. When a *pthread_join*( ) returns successfully, the target thread has been terminated. The results of multiple simultaneous calls to *pthread_join*( ) specifying the same target thread are undefined. If the thread calling *pthread_join*( ) is canceled, then the target thread shall not be detached.

It is unspecified whether a thread that has exited but remains unjoined counts against {PTHREAD_THREADS_MAX}.

The behavior is undefined if the value specified by the *thread* argument to *pthread_join*( ) does not refer to a joinable thread.

The behavior is undefined if the value specified by the *thread* argument to *pthread_join*( ) refers to the calling thread.

RETURN VALUE

If successful, the *pthread_join*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_join*( ) function may fail if:

[EDEADLK] A deadlock was detected.

The *pthread_join*( ) function shall not return an error code of [EINTR].

EXAMPLES

An example of thread creation and deletion follows:

```
typedef struct {
    int *ar;
    long n;
} subarray;

void *
incer(void *arg)
{
    long i;

    for (i = 0; i < ((subarray *)arg)->n; i++)
        ((subarray *)arg)->ar[i]++;
}

int main(void)
{
    int        ar[1000000];
    pthread_t  th1, th2;
    subarray   sb1, sb2;
```

```
        sb1.ar = &ar[0];
        sb1.n  = 500000;
        (void) pthread_create(&th1, NULL, incer, &sb1);
        sb2.ar = &ar[500000];
        sb2.n  = 500000;
        (void) pthread_create(&th2, NULL, incer, &sb2);
        (void) pthread_join(th1, NULL);
        (void) pthread_join(th2, NULL);
        return 0;
    }
```

APPLICATION USAGE

None.

RATIONALE

The *pthread_join*() function is a convenience that has proven useful in multi-threaded applications. It is true that a programmer could simulate this function if it were not provided by passing extra state as part of the argument to the *start_routine*(). The terminating thread would set a flag to indicate termination and broadcast a condition that is part of that state; a joining thread would wait on that condition variable. While such a technique would allow a thread to wait on more complex conditions (for example, waiting for multiple threads to terminate), waiting on individual thread termination is considered widely useful. Also, including the *pthread_join*() function in no way precludes a programmer from coding such complex waits. Thus, while not a primitive, including *pthread_join*() in this volume of POSIX.1-2017 was considered valuable.

The *pthread_join*() function provides a simple mechanism allowing an application to wait for a thread to terminate. After the thread terminates, the application may then choose to clean up resources that were used by the thread. For instance, after *pthread_join*() returns, any application-provided stack storage could be reclaimed.

The *pthread_join*() or *pthread_detach*() function should eventually be called for every thread that is created with the *detachstate* attribute set to PTHREAD_CREATE_JOINABLE so that storage associated with the thread may be reclaimed.

The interaction between *pthread_join*() and cancellation is well-defined for the following reasons:

- The *pthread_join*() function, like all other non-async-cancel-safe functions, can only be called with deferred cancelability type.
- Cancellation cannot occur in the disabled cancelability state.

Thus, only the default cancelability state need be considered. As specified, either the *pthread_join*() call is canceled, or it succeeds, but not both. The difference is obvious to the application, since either a cancellation handler is run or *pthread_join*() returns. There are no race conditions since *pthread_join*() was called in the deferred cancelability state.

If an implementation detects that the value specified by the *thread* argument to *pthread_join*() does not refer to a joinable thread, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *thread* argument to *pthread_join*() refers to the calling thread, it is recommended that the function should fail and report an [EDEADLK] error.

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended

that the function should fail and report an [ESRCH] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_join*( ) function is marked as part of the Threads option.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/97 is applied, updating the ERRORS section so that the [EINVAL] error is made optional and the words ``the implementation has detected'' are removed from it.

Issue 7

The *pthread_join*( ) function is moved from the Threads option to the Base.

Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

The [EINVAL] error for a non-joinable thread is removed; this condition results in undefined behavior.

The [EDEADLK] error for the calling thread is removed; this condition results in undefined behavior.

NAME

pthread_key_create — thread-specific data key creation

SYNOPSIS

```
#include <pthread.h>

int pthread_key_create(pthread_key_t *key, void (*destructor)(void*));
```

DESCRIPTION

The *pthread_key_create*( ) function shall create a thread-specific data key visible to all threads in the process. Key values provided by *pthread_key_create*( ) are opaque objects used to locate thread-specific data. Although the same key value may be used by different threads, the values bound to the key by *pthread_setspecific*( ) are maintained on a per-thread basis and persist for the life of the calling thread.

Upon key creation, the value NULL shall be associated with the new key in all active threads. Upon thread creation, the value NULL shall be associated with all defined keys in the new thread.

An optional destructor function may be associated with each key value. At thread exit, if a key value has a non-NULL destructor pointer, and the thread has a non-NULL value associated with that key, the value of the key is set to NULL, and then the function pointed to is called with the previously associated value as its sole argument. The order of destructor calls is unspecified if more than one destructor exists for a thread when it exits.

If, after all the destructors have been called for all non-NULL values with associated destructors, there are still some non-NULL values with associated destructors, then the process is repeated. If, after at least {PTHREAD_DESTRUCTOR_ITERATIONS} iterations of destructor calls for outstanding non-NULL values, there are still some non-NULL values with associated destructors, implementations may stop calling destructors, or they may continue calling destructors until no non-NULL values with associated destructors exist, even though this might result in an infinite loop.

RETURN VALUE

If successful, the *pthread_key_create*( ) function shall store the newly created key value at **key* and shall return zero. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_key_create*( ) function shall fail if:

[EAGAIN] The system lacked the necessary resources to create another thread-specific data key, or the system-imposed limit on the total number of keys per process {PTHREAD_KEYS_MAX} has been exceeded.

[ENOMEM] Insufficient memory exists to create the key.

The *pthread_key_create*( ) function shall not return an error code of [EINTR].

EXAMPLES

The following example demonstrates a function that initializes a thread-specific data key when it is first called, and associates a thread-specific object with each calling thread, initializing this object when necessary.

```
static pthread_key_t key;
static pthread_once_t key_once = PTHREAD_ONCE_INIT;

static void
make_key()
{
```

```
        (void) pthread_key_create(&key, NULL);
}

func()
{
    void *ptr;

    (void) pthread_once(&key_once, make_key);
    if ((ptr = pthread_getspecific(key)) == NULL) {
        ptr = malloc(OBJECT_SIZE);
        ...
        (void) pthread_setspecific(key, ptr);
    }
    ...
}
```

Note that the key has to be initialized before *pthread_getspecific*( ) or *pthread_setspecific*( ) can be used. The *pthread_key_create*( ) call could either be explicitly made in a module initialization routine, or it can be done implicitly by the first call to a module as in this example. Any attempt to use the key before it is initialized is a programming error, making the code below incorrect.

```
static pthread_key_t key;

func()
{
    void *ptr;

   /* KEY NOT INITIALIZED!!!  THIS WILL NOT WORK!!! */
    if ((ptr = pthread_getspecific(key)) == NULL &&
        pthread_setspecific(key, NULL) != 0) {
        pthread_key_create(&key, NULL);
        ...
    }
}
```

APPLICATION USAGE

None.

RATIONALE

Destructor Functions

Normally, the value bound to a key on behalf of a particular thread is a pointer to storage allocated dynamically on behalf of the calling thread. The destructor functions specified with *pthread_key_create*( ) are intended to be used to free this storage when the thread exits. Thread cancellation cleanup handlers cannot be used for this purpose because thread-specific data may persist outside the lexical scope in which the cancellation cleanup handlers operate.

If the value associated with a key needs to be updated during the lifetime of the thread, it may be necessary to release the storage associated with the old value before the new value is bound. Although the *pthread_setspecific*( ) function could do this automatically, this feature is not needed often enough to justify the added complexity. Instead, the programmer is responsible for freeing the stale storage:

```
pthread_getspecific(key, &old);
new = allocate();
destructor(old);
```

```
pthread_setspecific(key, new);
```

Note: The above example could leak storage if run with asynchronous cancellation enabled. No such problems occur in the default cancellation state if no cancellation points occur between the get and set.

There is no notion of a destructor-safe function. If an application does not call *pthread_exit*( ) from a signal handler, or if it blocks any signal whose handler may call *pthread_exit*( ) while calling async-unsafe functions, all functions may be safely called from destructors.

Non-Idempotent Data Key Creation

There were requests to make *pthread_key_create*( ) idempotent with respect to a given *key* address parameter. This would allow applications to call *pthread_key_create*( ) multiple times for a given *key* address and be guaranteed that only one key would be created. Doing so would require the key value to be previously initialized (possibly at compile time) to a known null value and would require that implicit mutual-exclusion be performed based on the address and contents of the *key* parameter in order to guarantee that exactly one key would be created.

Unfortunately, the implicit mutual-exclusion would not be limited to only *pthread_key_create*( ). On many implementations, implicit mutual-exclusion would also have to be performed by *pthread_getspecific*( ) and *pthread_setspecific*( ) in order to guard against using incompletely stored or not-yet-visible key values. This could significantly increase the cost of important operations, particularly *pthread_getspecific*( ).

Thus, this proposal was rejected. The *pthread_key_create*( ) function performs no implicit synchronization. It is the responsibility of the programmer to ensure that it is called exactly once per key before use of the key. Several straightforward mechanisms can already be used to accomplish this, including calling explicit module initialization functions, using mutexes, and using *pthread_once*( ). This places no significant burden on the programmer, introduces no possibly confusing *ad hoc* implicit synchronization mechanism, and potentially allows commonly used thread-specific data operations to be more efficient.

NAME

pthread_key_delete — thread-specific data key deletion

SYNOPSIS

```
#include <pthread.h>

int pthread_key_delete(pthread_key_t key);
```

DESCRIPTION

The *pthread_key_delete*( ) function shall delete a thread-specific data key previously returned by *pthread_key_create*( ). The thread-specific data values associated with *key* need not be NULL at the time *pthread_key_delete*( ) is called. It is the responsibility of the application to free any application storage or perform any cleanup actions for data structures related to the deleted key or associated thread-specific data in any threads; this cleanup can be done either before or after *pthread_key_delete*( ) is called. Any attempt to use *key* following the call to *pthread_key_delete*( ) results in undefined behavior.

The *pthread_key_delete*( ) function shall be callable from within destructor functions. No destructor functions shall be invoked by *pthread_key_delete*( ). Any destructor function that may have been associated with *key* shall no longer be called upon thread exit.

RETURN VALUE

If successful, the *pthread_key_delete*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_key_delete*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

A thread-specific data key deletion function has been included in order to allow the resources associated with an unused thread-specific data key to be freed. Unused thread-specific data keys can arise, among other scenarios, when a dynamically loaded module that allocated a key is unloaded.

Conforming applications are responsible for performing any cleanup actions needed for data structures associated with the key to be deleted, including data referenced by thread-specific data values. No such cleanup is done by *pthread_key_delete*( ). In particular, destructor functions are not called. There are several reasons for this division of responsibility:

1. The associated destructor functions used to free thread-specific data at thread exit time are only guaranteed to work correctly when called in the thread that allocated the thread-specific data. (Destructors themselves may utilize thread-specific data.) Thus, they cannot be used to free thread-specific data in other threads at key deletion time. Attempting to have them called by other threads at key deletion time would require other threads to be asynchronously interrupted. But since interrupted threads could be in an arbitrary state, including holding locks necessary for the destructor to run, this approach would fail. In general, there is no safe mechanism whereby an implementation could free thread-specific data at key deletion time.

2. Even if there were a means of safely freeing thread-specific data associated with keys to be deleted, doing so would require that implementations be able to enumerate the threads with non-NULL data and potentially keep them from creating more thread-

specific data while the key deletion is occurring. This special case could cause extra synchronization in the normal case, which would otherwise be unnecessary.

For an application to know that it is safe to delete a key, it has to know that all the threads that might potentially ever use the key do not attempt to use it again. For example, it could know this if all the client threads have called a cleanup procedure declaring that they are through with the module that is being shut down, perhaps by setting a reference count to zero.

If an implementation detects that the value specified by the *key* argument to *pthread_key_delete*( ) does not refer to a a key value obtained from *pthread_key_create*( ) or refers to a key that has been deleted with *pthread_key_delete*( ), it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

Issue 6

The *pthread_key_delete*( ) function is marked as part of the Threads option.

Issue 7

The *pthread_key_delete*( ) function is moved from the Threads option to the Base.

The [EINVAL] error for a key value not obtained from *pthread_key_create*( ) or a key deleted with *pthread_key_delete*( ) is removed; this condition results in undefined behavior.

NAME

pthread_kill — send a signal to a thread

SYNOPSIS

CX
```
#include <signal.h>

int pthread_kill(pthread_t thread, int sig);
```

DESCRIPTION

The *pthread_kill*( ) function shall request that a signal be delivered to the specified thread.

As in *kill*( ), if *sig* is zero, error checking shall be performed but no signal shall actually be sent.

RETURN VALUE

Upon successful completion, the function shall return a value of zero. Otherwise, the function shall return an error number. If the *pthread_kill*( ) function fails, no signal shall be sent.

ERRORS

The *pthread_kill*( ) function shall fail if:

[EINVAL] The value of the *sig* argument is an invalid or unsupported signal number.

The *pthread_kill*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

The *pthread_kill*( ) function provides a mechanism for asynchronously directing a signal at a thread in the calling process. This could be used, for example, by one thread to affect broadcast delivery of a signal to a set of threads.

Note that *pthread_kill*( ) only causes the signal to be handled in the context of the given thread; the signal action (termination or stopping) affects the process as a whole.

RATIONALE

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended that the function should fail and report an [ESRCH] error.

Existing implementations vary on the result of a *pthread_kill*( ) with a thread ID indicating an inactive thread (a terminated thread that has not been detached or joined). Some indicate success on such a call, while others give an error of [ESRCH]. Since the definition of thread lifetime in this volume of POSIX.1-2017 covers inactive threads, the [ESRCH] error as described is inappropriate in this case. In particular, this means that an application cannot have one thread check for termination of another with *pthread_kill*( ).

FUTURE DIRECTIONS

A future version of this standard may require that *pthread_kill*( ) not fail with [ESRCH] in the case of sending signals to an inactive thread (a terminated thread not yet detached or joined), even though no signal will be delivered because the thread is no longer running.

NAME

pthread_mutex_consistent — mark state protected by robust mutex as consistent

SYNOPSIS

```
#include <pthread.h>

int pthread_mutex_consistent(pthread_mutex_t *mutex);
```

DESCRIPTION

If *mutex* is a robust mutex in an inconsistent state, the *pthread_mutex_consistent*( ) function can be used to mark the state protected by the mutex referenced by *mutex* as consistent again.

If an owner of a robust mutex terminates while holding the mutex, the mutex becomes inconsistent and the next thread that acquires the mutex lock shall be notified of the state by the return value [EOWNERDEAD]. In this case, the mutex does not become normally usable again until the state is marked consistent.

If the thread which acquired the mutex lock with the return value [EOWNERDEAD] terminates before calling either *pthread_mutex_consistent*( ) or *pthread_mutex_unlock*( ), the next thread that acquires the mutex lock shall be notified about the state of the mutex by the return value [EOWNERDEAD].

The behavior is undefined if the value specified by the *mutex* argument to *pthread_mutex_consistent*( ) does not refer to an initialized mutex.

RETURN VALUE

Upon successful completion, the *pthread_mutex_consistent*( ) function shall return zero. Otherwise, an error value shall be returned to indicate the error.

ERRORS

The *pthread_mutex_consistent*( ) function shall fail if:

[EINVAL] The mutex object referenced by *mutex* is not robust or does not protect an inconsistent state.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

The *pthread_mutex_consistent*( ) function is only responsible for notifying the implementation that the state protected by the mutex has been recovered and that normal operations with the mutex can be resumed. It is the responsibility of the application to recover the state so it can be reused. If the application is not able to perform the recovery, it can notify the implementation that the situation is unrecoverable by a call to *pthread_mutex_unlock*( ) without a prior call to *pthread_mutex_consistent*( ), in which case subsequent threads that attempt to lock the mutex will fail to acquire the lock and be returned [ENOTRECOVERABLE].

RATIONALE

If an implementation detects that the value specified by the *mutex* argument to *pthread_mutex_consistent*( ) does not refer to an initialized mutex, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 7.

54131 **NAME**

54132 pthread_mutex_destroy, pthread_mutex_init — destroy and initialize a mutex

54133 **SYNOPSIS**

54134 ```
#include <pthread.h>
```

54135 ```
int pthread_mutex_destroy(pthread_mutex_t *mutex);
```
54136 ```
int pthread_mutex_init(pthread_mutex_t *restrict mutex,
```
54137 ```
    const pthread_mutexattr_t *restrict attr);
```
54138 ```
pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;
```

54139 **DESCRIPTION**

54140 The *pthread_mutex_destroy*( ) function shall destroy the mutex object referenced by *mutex*; the
54141 mutex object becomes, in effect, uninitialized. An implementation may cause
54142 *pthread_mutex_destroy*( ) to set the object referenced by *mutex* to an invalid value.

54143 A destroyed mutex object can be reinitialized using *pthread_mutex_init*( ); the results of otherwise
54144 referencing the object after it has been destroyed are undefined.

54145 It shall be safe to destroy an initialized mutex that is unlocked. Attempting to destroy a locked
54146 mutex, or a mutex that another thread is attempting to lock, or a mutex that is being used in a
54147 *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ) call by another thread, results in undefined
54148 behavior.

54149 The *pthread_mutex_init*( ) function shall initialize the mutex referenced by *mutex* with attributes
54150 specified by *attr*. If *attr* is NULL, the default mutex attributes are used; the effect shall be the
54151 same as passing the address of a default mutex attributes object. Upon successful initialization,
54152 the state of the mutex becomes initialized and unlocked.

54153 See Section 2.9.9 (on page 523) for further requirements.

54154 Attempting to initialize an already initialized mutex results in undefined behavior.

54155 In cases where default mutex attributes are appropriate, the macro
54156 PTHREAD_MUTEX_INITIALIZER can be used to initialize mutexes. The effect shall be
54157 equivalent to dynamic initialization by a call to *pthread_mutex_init*( ) with parameter *attr*
54158 specified as NULL, except that no error checks are performed.

54159 The behavior is undefined if the value specified by the *mutex* argument to
54160 *pthread_mutex_destroy*( ) does not refer to an initialized mutex.

54161 The behavior is undefined if the value specified by the *attr* argument to *pthread_mutex_init*( )
54162 does not refer to an initialized mutex attributes object.

54163 **RETURN VALUE**

54164 If successful, the *pthread_mutex_destroy*( ) and *pthread_mutex_init*( ) functions shall return zero;
54165 otherwise, an error number shall be returned to indicate the error.

54166 **ERRORS**

54167 The *pthread_mutex_init*( ) function shall fail if:

54168 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize
54169 another mutex.

54170 [ENOMEM] Insufficient memory exists to initialize the mutex.

54171 [EPERM] The caller does not have the privilege to perform the operation.

  
```

The *pthread_mutex_init*( ) function may fail if:

[EINVAL] The attributes object referenced by *attr* has the robust mutex attribute set without the process-shared attribute being set.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *mutex* argument to *pthread_mutex_destroy*( ) does not refer to an initialized mutex, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *mutex* argument to *pthread_mutex_destroy*( ) or *pthread_mutex_init*( ) refers to a locked mutex or a mutex that is referenced (for example, while being used in a *pthread_cond_timedwait*( ) or *pthread_cond_wait*( )) by another thread, or detects that the value specified by the *mutex* argument to *pthread_mutex_init*( ) refers to an already initialized mutex, it is recommended that the function should fail and report an [EBUSY] error.

If an implementation detects that the value specified by the *attr* argument to *pthread_mutex_init*( ) does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

Alternate Implementations Possible

This volume of POSIX.1-2017 supports several alternative implementations of mutexes. An implementation may store the lock directly in the object of type **pthread_mutex_t**. Alternatively, an implementation may store the lock in the heap and merely store a pointer, handle, or unique ID in the mutex object. Either implementation has advantages or may be required on certain hardware configurations. So that portable code can be written that is invariant to this choice, this volume of POSIX.1-2017 does not define assignment or equality for this type, and it uses the term ``initialize'' to reinforce the (more restrictive) notion that the lock may actually reside in the mutex object itself.

Note that this precludes an over-specification of the type of the mutex or condition variable and motivates the opaqueness of the type.

An implementation is permitted, but not required, to have *pthread_mutex_destroy*( ) store an illegal value into the mutex. This may help detect erroneous programs that try to lock (or otherwise reference) a mutex that has already been destroyed.

Tradeoff Between Error Checks and Performance Supported

Many error conditions that can occur are not required to be detected by the implementation in order to let implementations trade off performance *versus* degree of error checking according to the needs of their specific applications and execution environment. As a general rule, conditions caused by the system (such as insufficient memory) are required to be detected, but conditions caused by an erroneously coded application (such as failing to provide adequate synchronization to prevent a mutex from being deleted while in use) are specified to result in undefined behavior.

A wide range of implementations is thus made possible. For example, an implementation

intended for application debugging may implement all of the error checks, but an implementation running a single, provably correct application under very tight performance constraints in an embedded computer might implement minimal checks. An implementation might even be provided in two versions, similar to the options that compilers provide: a full-checking, but slower version; and a limited-checking, but faster version. To forbid this optionality would be a disservice to users.

By carefully limiting the use of ``undefined behavior'' only to things that an erroneous (badly coded) application might do, and by defining that resource-not-available errors are mandatory, this volume of POSIX.1-2017 ensures that a fully-conforming application is portable across the full range of implementations, while not forcing all implementations to add overhead to check for numerous things that a correct program never does. When the behavior is undefined, no error number is specified to be returned on implementations that do detect the condition. This is because undefined behavior means *anything* can happen, which includes returning with any value (which might happen to be a valid, but different, error number). However, since the error number might be useful to application developers when diagnosing problems during application development, a recommendation is made in rationale that implementors should return a particular error number if their implementation does detect the condition.

Why No Limits are Defined

Defining symbols for the maximum number of mutexes and condition variables was considered but rejected because the number of these objects may change dynamically. Furthermore, many implementations place these objects into application memory; thus, there is no explicit maximum.

Static Initializers for Mutexes and Condition Variables

Providing for static initialization of statically allocated synchronization objects allows modules with private static synchronization variables to avoid runtime initialization tests and overhead. Furthermore, it simplifies the coding of self-initializing modules. Such modules are common in C libraries, where for various reasons the design calls for self-initialization instead of requiring an explicit module initialization function to be called. An example use of static initialization follows.

Without static initialization, a self-initializing routine *foo*( ) might look as follows:

```
static pthread_once_t foo_once = PTHREAD_ONCE_INIT;
static pthread_mutex_t foo_mutex;

void foo_init()
{
    pthread_mutex_init(&foo_mutex, NULL);
}

void foo()
{
    pthread_once(&foo_once, foo_init);
    pthread_mutex_lock(&foo_mutex);
   /* Do work. */
    pthread_mutex_unlock(&foo_mutex);
}
```

With static initialization, the same routine could be coded as follows:

```
static pthread_mutex_t foo_mutex = PTHREAD_MUTEX_INITIALIZER;
```

```
void foo()
{
    pthread_mutex_lock(&foo_mutex);
   /* Do work. */
    pthread_mutex_unlock(&foo_mutex);
}
```

Note that the static initialization both eliminates the need for the initialization test inside *pthread_once*( ) and the fetch of *&foo_mutex* to learn the address to be passed to *pthread_mutex_lock*( ) or *pthread_mutex_unlock*( ).

Thus, the C code written to initialize static objects is simpler on all systems and is also faster on a large class of systems; those where the (entire) synchronization object can be stored in application memory.

Yet the locking performance question is likely to be raised for machines that require mutexes to be allocated out of special memory. Such machines actually have to have mutexes and possibly condition variables contain pointers to the actual hardware locks. For static initialization to work on such machines, *pthread_mutex_lock*( ) also has to test whether or not the pointer to the actual lock has been allocated. If it has not, *pthread_mutex_lock*( ) has to initialize it before use. The reservation of such resources can be made when the program is loaded, and hence return codes have not been added to mutex locking and condition variable waiting to indicate failure to complete initialization.

This runtime test in *pthread_mutex_lock*( ) would at first seem to be extra work; an extra test is required to see whether the pointer has been initialized. On most machines this would actually be implemented as a fetch of the pointer, testing the pointer against zero, and then using the pointer if it has already been initialized. While the test might seem to add extra work, the extra effort of testing a register is usually negligible since no extra memory references are actually done. As more and more machines provide caches, the real expenses are memory references, not instructions executed.

Alternatively, depending on the machine architecture, there are often ways to eliminate *all* overhead in the most important case: on the lock operations that occur *after* the lock has been initialized. This can be done by shifting more overhead to the less frequent operation: initialization. Since out-of-line mutex allocation also means that an address has to be dereferenced to find the actual lock, one technique that is widely applicable is to have static initialization store a bogus value for that address; in particular, an address that causes a machine fault to occur. When such a fault occurs upon the first attempt to lock such a mutex, validity checks can be done, and then the correct address for the actual lock can be filled in. Subsequent lock operations incur no extra overhead since they do not ``fault''. This is merely one technique that can be used to support static initialization, while not adversely affecting the performance of lock acquisition. No doubt there are other techniques that are highly machine-dependent.

The locking overhead for machines doing out-of-line mutex allocation is thus similar for modules being implicitly initialized, where it is improved for those doing mutex allocation entirely inline. The inline case is thus made much faster, and the out-of-line case is not significantly worse.

Besides the issue of locking performance for such machines, a concern is raised that it is possible that threads would serialize contending for initialization locks when attempting to finish initializing statically allocated mutexes. (Such finishing would typically involve taking an internal lock, allocating a structure, storing a pointer to the structure in the mutex, and releasing the internal lock.) First, many implementations would reduce such serialization by hashing on the mutex address. Second, such serialization can only occur a bounded number of times. In

particular, it can happen at most as many times as there are statically allocated synchronization objects. Dynamically allocated objects would still be initialized via *pthread_mutex_init*( ) or *pthread_cond_init*( ).

Finally, if none of the above optimization techniques for out-of-line allocation yields sufficient performance for an application on some implementation, the application can avoid static initialization altogether by explicitly initializing all synchronization objects with the corresponding *pthread_*_init*( ) functions, which are supported by all implementations. An implementation can also document the tradeoffs and advise which initialization technique is more efficient for that particular implementation.

Destroying Mutexes

A mutex can be destroyed immediately after it is unlocked. However, since attempting to destroy a locked mutex, or a mutex that another thread is attempting to lock, or a mutex that is being used in a *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ) call by another thread, results in undefined behavior, care must be taken to ensure that no other thread may be referencing the mutex.

Robust Mutexes

Implementations are required to provide robust mutexes for mutexes with the process-shared attribute set to PTHREAD_PROCESS_SHARED. Implementations are allowed, but not required, to provide robust mutexes when the process-shared attribute is set to PTHREAD_PROCESS_PRIVATE.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_mutex_destroy*( ) and *pthread_mutex_init*( ) functions are marked as part of the Threads option.

The *pthread_mutex_timedlock*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1c #34 is applied, updating the DESCRIPTION.

The **restrict** keyword is added to the *pthread_mutex_init*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

The *pthread_mutex_destroy*( ) and *pthread_mutex_init*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized mutex or an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

The [EBUSY] error for a locked mutex, a mutex that is referenced, or an already initialized mutex is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0460 [70,428] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0278 [811], XSH/TC2-2008/0279 [972], and XSH/TC2-2008/0280 [811] are applied.

NAME

pthread_mutex_getprioceiling, pthread_mutex_setprioceiling — get and set the priority ceiling of a mutex (**REALTIME THREADS**)

SYNOPSIS

RPP|TPP

```
#include <pthread.h>

int pthread_mutex_getprioceiling(const pthread_mutex_t *restrict mutex,
    int *restrict prioceiling);
int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
    int prioceiling, int *restrict old_ceiling);
```

DESCRIPTION

The *pthread_mutex_getprioceiling*( ) function shall return the current priority ceiling of the mutex.

The *pthread_mutex_setprioceiling*( ) function shall attempt to lock the mutex as if by a call to *pthread_mutex_lock*( ), except that the process of locking the mutex need not adhere to the priority protect protocol. On acquiring the mutex it shall change the mutex's priority ceiling and then release the mutex as if by a call to *pthread_mutex_unlock*( ). When the change is successful, the previous value of the priority ceiling shall be returned in *old_ceiling*.

If the *pthread_mutex_setprioceiling*( ) function fails, the mutex priority ceiling shall not be changed.

RETURN VALUE

If successful, the *pthread_mutex_getprioceiling*( ) and *pthread_mutex_setprioceiling*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions shall fail if:

[EINVAL] The protocol attribute of *mutex* is PTHREAD_PRIO_NONE.

[EPERM] The implementation requires appropriate privileges to perform the operation and the caller does not have appropriate privileges.

The *pthread_mutex_setprioceiling*( ) function shall fail if:

[EAGAIN] The mutex could not be acquired because the maximum number of recursive locks for *mutex* has been exceeded.

[EDEADLK] The mutex type is PTHREAD_MUTEX_ERRORCHECK and the current thread already owns the mutex.

[EINVAL] The mutex was created with the protocol attribute having the value PTHREAD_PRIO_PROTECT and the calling thread's priority is higher than the mutex's current priority ceiling, and the implementation adheres to the priority protect protocol in the process of locking the mutex.

[ENOTRECOVERABLE] The mutex is a robust mutex and the state protected by the mutex is not recoverable.

[EOWNERDEAD] The mutex is a robust mutex and the process containing the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent (see *pthread_mutex_lock*( )).

The *pthread_mutex_setprioceiling*( ) function may fail if:

[EDEADLK] A deadlock condition was detected.

[EINVAL] The priority requested by *prioceiling* is out of range.

[EOWNERDEAD]
The mutex is a robust mutex and the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent (see *pthread_mutex_lock*( )).

These functions shall not return an error code of [EINTR].

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Marked as part of the Realtime Threads Feature Group.

Issue 6

The *pthread_mutex_getprioceiling*( ) and *pthread_mutex_setprioceiling*( ) functions are marked as part of the Threads and Thread Priority Protection options.

The [ENOSYS] error conditions have been removed.

The *pthread_mutex_timedlock*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread_mutex_getprioceiling*( ) and *pthread_mutex_setprioceiling*( ) prototypes for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

SD5-XSH-ERN-39 is applied.

Austin Group Interpretation 1003.1-2001 #052 is applied, adding [EDEADLK] as a ``may fail'' error.

SD5-XSH-ERN-158 is applied, updating the ERRORS section to include a ``shall fail'' error case for when the protocol attribute of *mutex* is PTHREAD_PRIO_NONE.

The *pthread_mutex_getprioceiling*( ) and *pthread_mutex_setprioceiling*( ) functions are moved from the Threads option to require support of either the Robust Mutex Priority Protection option or the Non-Robust Mutex Priority Protection option.

The DESCRIPTION and ERRORS sections are updated to account properly for all of the various mutex types.

NAME

pthread_mutex_init — destroy and initialize a mutex

SYNOPSIS

```
#include <pthread.h>

int pthread_mutex_init(pthread_mutex_t *restrict mutex,
    const pthread_mutexattr_t *restrict attr);
pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;
```

DESCRIPTION

Refer to *pthread_mutex_destroy( )*.

NAME

pthread_mutex_lock, pthread_mutex_trylock, pthread_mutex_unlock — lock and unlock a mutex

SYNOPSIS

```
#include <pthread.h>

int pthread_mutex_lock(pthread_mutex_t *mutex);
int pthread_mutex_trylock(pthread_mutex_t *mutex);
int pthread_mutex_unlock(pthread_mutex_t *mutex);
```

DESCRIPTION

The mutex object referenced by *mutex* shall be locked by a call to *pthread_mutex_lock*( ) that returns zero or [EOWNERDEAD]. If the mutex is already locked by another thread, the calling thread shall block until the mutex becomes available. This operation shall return with the mutex object referenced by *mutex* in the locked state with the calling thread as its owner. If a thread attempts to relock a mutex that it has already locked, *pthread_mutex_lock*( ) shall behave as described in the **Relock** column of the following table. If a thread attempts to unlock a mutex that it has not locked or a mutex which is unlocked, *pthread_mutex_unlock*( ) shall behave as described in the **Unlock When Not Owner** column of the following table.

Mutex Type	Robustness	Relock	Unlock When Not Owner
NORMAL	non-robust	deadlock	undefined behavior
NORMAL	robust	deadlock	error returned
ERRORCHECK	either	error returned	error returned
RECURSIVE	either	recursive (see below)	error returned
DEFAULT	non-robust	undefined behavior •	undefined behavior •
DEFAULT	robust	undefined behavior •	error returned

• the mutex type is PTHREAD_MUTEX_DEFAULT, the behavior of *pthread_mutex_lock*( ) may correspond to one of the three other standard mutex types as described in the table above. If it does not correspond to one of those three, the behavior is undefined for the cases marked †.

Where the table indicates recursive behavior, the mutex shall maintain the concept of a lock count. When a thread successfully acquires a mutex for the first time, the lock count shall be set to one. Every time a thread relocks this mutex, the lock count shall be incremented by one. Each time the thread unlocks the mutex, the lock count shall be decremented by one. When the lock count reaches zero, the mutex shall become available for other threads to acquire.

The *pthread_mutex_trylock*( ) function shall be equivalent to *pthread_mutex_lock*( ), except that if the mutex object referenced by *mutex* is currently locked (by any thread, including the current thread), the call shall return immediately. If the mutex type is PTHREAD_MUTEX_RECURSIVE and the mutex is currently owned by the calling thread, the mutex lock count shall be incremented by one and the *pthread_mutex_trylock*( ) function shall immediately return success.

The *pthread_mutex_unlock*( ) function shall release the mutex object referenced by *mutex*. The manner in which a mutex is released is dependent upon the mutex's type attribute. If there are threads blocked on the mutex object referenced by *mutex* when *pthread_mutex_unlock*( ) is called, resulting in the mutex becoming available, the scheduling policy shall determine which thread shall acquire the mutex.

(In the case of PTHREAD_MUTEX_RECURSIVE mutexes, the mutex shall become available when the count reaches zero and the calling thread no longer has any locks on this mutex.)

If a signal is delivered to a thread waiting for a mutex, upon return from the signal handler the thread shall resume waiting for the mutex as if it was not interrupted.

If *mutex* is a robust mutex and the process containing the owning thread terminated while holding the mutex lock, a call to *pthread_mutex_lock*( ) shall return the error value [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread terminated while holding the mutex lock, a call to *pthread_mutex_lock*( ) may return the error value [EOWNERDEAD] even if the process in which the owning thread resides has not terminated. In these cases, the mutex is locked by the thread but the state it protects is marked as inconsistent. The application should ensure that the state is made consistent for reuse and when that is complete call *pthread_mutex_consistent*( ). If the application is unable to recover the state, it should unlock the mutex without a prior call to *pthread_mutex_consistent*( ), after which the mutex is marked permanently unusable.

If *mutex* does not refer to an initialized mutex object, the behavior of *pthread_mutex_lock*( ), *pthread_mutex_trylock*( ), and *pthread_mutex_unlock*( ) is undefined.

RETURN VALUE

If successful, the *pthread_mutex_lock*( ), *pthread_mutex_trylock*( ), and *pthread_mutex_unlock*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutex_lock*( ) and *pthread_mutex_trylock*( ) functions shall fail if:

[EAGAIN] The mutex could not be acquired because the maximum number of recursive locks for *mutex* has been exceeded.

RPP | TPP [EINVAL] The *mutex* was created with the protocol attribute having the value PTHREAD_PRIO_PROTECT and the calling thread's priority is higher than the mutex's current priority ceiling.

[ENOTRECOVERABLE]
The state protected by the mutex is not recoverable.

[EOWNERDEAD]
The mutex is a robust mutex and the process containing the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent.

The *pthread_mutex_lock*( ) function shall fail if:

[EDEADLK] The mutex type is PTHREAD_MUTEX_ERRORCHECK and the current thread already owns the mutex.

The *pthread_mutex_trylock*( ) function shall fail if:

[EBUSY] The *mutex* could not be acquired because it was already locked.

The *pthread_mutex_unlock*( ) function shall fail if:

[EPERM] The mutex type is PTHREAD_MUTEX_ERRORCHECK or PTHREAD_MUTEX_RECURSIVE, or the mutex is a robust mutex, and the current thread does not own the mutex.

The *pthread_mutex_lock*( ) and *pthread_mutex_trylock*( ) functions may fail if:

[EOWNERDEAD]
The mutex is a robust mutex and the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent.

The *pthread_mutex_lock*( ) function may fail if:

[EDEADLK] A deadlock condition was detected.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications that have assumed that non-zero return values are errors will need updating for use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If an application is supposed to work with normal and robust mutexes it should check all return values for error conditions and if necessary take appropriate action.

RATIONALE

Mutex objects are intended to serve as a low-level primitive from which other thread synchronization functions can be built. As such, the implementation of mutexes should be as efficient as possible, and this has ramifications on the features available at the interface.

The mutex functions and the particular default settings of the mutex attributes have been motivated by the desire to not preclude fast, inlined implementations of mutex locking and unlocking.

Since most attributes only need to be checked when a thread is going to be blocked, the use of attributes does not slow the (common) mutex-locking case.

Likewise, while being able to extract the thread ID of the owner of a mutex might be desirable, it would require storing the current thread ID when each mutex is locked, and this could incur unacceptable levels of overhead. Similar arguments apply to a *mutex_tryunlock* operation.

For further rationale on the extended mutex types, see XRAT Threads Extensions (on page 3642).

If an implementation detects that the value specified by the *mutex* argument does not refer to an initialized mutex object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

XBD Section 4.12 (on page 111), **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_mutex_lock*( ), *pthread_mutex_trylock*( ), and *pthread_mutex_unlock*( ) functions are marked as part of the Threads option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

> The behavior when attempting to relock a mutex is defined.

The *pthread_mutex_timedlock*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/98 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition. The RATIONALE section is also reworded to take into account non-XSI-conformant systems.

Issue 7

SD5-XSH-ERN-43 is applied, marking the ``shall fail'' case of the [EINVAL] error as dependent on the Thread Priority Protection option.

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

The *pthread_mutex_lock*( ), *pthread_mutex_trylock*( ), and *pthread_mutex_unlock*( ) functions are moved from the Threads option to the Base.

The following extended mutex types are moved from the XSI option to the Base:

> PTHREAD_MUTEX_NORMAL
> PTHREAD_MUTEX_ERRORCHECK
> PTHREAD_MUTEX_RECURSIVE
> PTHREAD_MUTEX_DEFAULT

The DESCRIPTION is updated to clarify the behavior when *mutex* does not refer to an initialized mutex.

The ERRORS section is updated to account properly for all of the various mutex types.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0461 [121], XSH/TC1-2008/0462 [92,428], and XSH/TC1-2008/0463 [121] are applied.

NAME

pthread_mutex_setprioceiling ‡′ change the priority ceiling of a mutex (**REALTIME THREADS**)

SYNOPSIS

RPP|TPP

```
#include <pthread.h>

int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
    int prioceiling, int *restrict old_ceiling);
```

DESCRIPTION

Refer to *pthread_mutex_getprioceiling( )*.

54615 **NAME**

54616 pthread_mutex_timedlock — lock a mutex

54617 **SYNOPSIS**

54618 ```
#include <pthread.h>
```

54619 ```
#include <time.h>
```

54620 ```
int pthread_mutex_timedlock(pthread_mutex_t *restrict mutex,
```

54621 ```
    const struct timespec *restrict abstime);
```

54622 **DESCRIPTION**

54623 The *pthread_mutex_timedlock*( ) function shall lock the mutex object referenced by *mutex*. If the
54624 mutex is already locked, the calling thread shall block until the mutex becomes available as in
54625 the *pthread_mutex_lock*( ) function. If the mutex cannot be locked without waiting for another
54626 thread to unlock the mutex, this wait shall be terminated when the specified timeout expires.

54627 The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the
54628 clock on which timeouts are based (that is, when the value of that clock equals or exceeds
54629 *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the
54630 call.

54631 The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall
54632 be the resolution of the clock on which it is based. The **timespec** data type is defined in the
54633 **<time.h>** header.

54634 Under no circumstance shall the function fail with a timeout if the mutex can be locked
54635 immediately. The validity of the *abstime* parameter need not be checked if the mutex can be
54636 locked immediately.

54637 RPI | TPI As a consequence of the priority inheritance rules (for mutexes initialized with the
54638 PRIO_INHERIT protocol), if a timed mutex wait is terminated because its timeout expires, the
54639 priority of the owner of the mutex shall be adjusted as necessary to reflect the fact that this
54640 thread is no longer among the threads waiting for the mutex.

54641 If *mutex* is a robust mutex and the process containing the owning thread terminated while
54642 holding the mutex lock, a call to *pthread_mutex_timedlock*( ) shall return the error value
54643 [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread terminated while holding
54644 the mutex lock, a call to *pthread_mutex_timedlock*( ) may return the error value [EOWNERDEAD]
54645 even if the process in which the owning thread resides has not terminated. In these cases, the
54646 mutex is locked by the thread but the state it protects is marked as inconsistent. The application
54647 should ensure that the state is made consistent for reuse and when that is complete call
54648 *pthread_mutex_consistent*( ). If the application is unable to recover the state, it should unlock the
54649 mutex without a prior call to *pthread_mutex_consistent*( ), after which the mutex is marked
54650 permanently unusable.

54651 If *mutex* does not refer to an initialized mutex object, the behavior is undefined.

54652 **RETURN VALUE**

54653 If successful, the *pthread_mutex_timedlock*( ) function shall return zero; otherwise, an error
54654 number shall be returned to indicate the error.

54655 **ERRORS**

54656 The *pthread_mutex_timedlock*( ) function shall fail if:

54657 [EAGAIN] The mutex could not be acquired because the maximum number of recursive
54658 locks for *mutex* has been exceeded.

54659 [EDEADLK] The mutex type is PTHREAD_MUTEX_ERRORCHECK and the current
54660 thread already owns the mutex.

54661 [EINVAL] The mutex was created with the protocol attribute having the value
54662 PTHREAD_PRIO_PROTECT and the calling thread's priority is higher than
54663 the mutex' current priority ceiling.

54664 [EINVAL] The process or thread would have blocked, and the *abstime* parameter
54665 specified a nanoseconds field value less than zero or greater than or equal to
54666 1 000 million.

54667 [ENOTRECOVERABLE]
54668 The state protected by the mutex is not recoverable.

54669 [EOWNERDEAD]
54670 The mutex is a robust mutex and the process containing the previous owning
54671 thread terminated while holding the mutex lock. The mutex lock shall be
54672 acquired by the calling thread and it is up to the new owner to make the state
54673 consistent.

54674 [ETIMEDOUT] The mutex could not be locked before the specified timeout expired.

54675 The *pthread_mutex_timedlock*( ) function may fail if:

54676 [EDEADLK] A deadlock condition was detected.

54677 [EOWNERDEAD]
54678 The mutex is a robust mutex and the previous owning thread terminated
54679 while holding the mutex lock. The mutex lock shall be acquired by the calling
54680 thread and it is up to the new owner to make the state consistent.

54681 This function shall not return an error code of [EINTR].

54682 **EXAMPLES**

54683 None.

54684 **APPLICATION USAGE**

54685 Applications that have assumed that non-zero return values are errors will need updating for
54686 use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting
54687 a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error
54688 returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If
54689 an application is supposed to work with normal and robust mutexes, it should check all return
54690 values for error conditions and if necessary take appropriate action.

54691 **RATIONALE**

54692 Refer to *pthread_mutex_lock*( ).

54693 **FUTURE DIRECTIONS**

54694 None.

54695 **SEE ALSO**

54696 *pthread_mutex_destroy*( ), *pthread_mutex_lock*( ), *time*( )

54697 XBD Section 4.12 (on page 111), **<pthread.h>**, **<time.h>**

54698 **CHANGE HISTORY**

54699 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

54700 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/99 is applied, marking the last paragraph
54701 in the DESCRIPTION as part of the Thread Priority Inheritance option.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/100 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

The *pthread_mutex_timedlock*( ) function is moved from the Timeouts option to the Base.

Functionality relating to the Timers option is moved to the Base.

The DESCRIPTION is updated to clarify the behavior when *mutex* does not refer to an initialized mutex.

The ERRORS section is updated to account properly for all of the various mutex types.

NAME

pthread_mutex_trylock, pthread_mutex_unlock — lock and unlock a mutex

SYNOPSIS

```
#include <pthread.h>

int pthread_mutex_trylock(pthread_mutex_t *mutex);
int pthread_mutex_unlock(pthread_mutex_t *mutex);
```

DESCRIPTION

Refer to *pthread_mutex_lock( )*.

54719 **NAME**

54720 pthread_mutexattr_destroy, pthread_mutexattr_init ‡’ destroy and initialize the mutex
54721 attributes object

54722 **SYNOPSIS**

54723 ```
#include <pthread.h>

int pthread_mutexattr_destroy(pthread_mutexattr_t *attr);
int pthread_mutexattr_init(pthread_mutexattr_t *attr);
```

54726 **DESCRIPTION**

54727 The *pthread_mutexattr_destroy*( ) function shall destroy a mutex attributes object; the object
54728 becomes, in effect, uninitialized. An implementation may cause *pthread_mutexattr_destroy*( ) to
54729 set the object referenced by *attr* to an invalid value.

54730 A destroyed *attr* attributes object can be reinitialized using *pthread_mutexattr_init*( ); the results of
54731 otherwise referencing the object after it has been destroyed are undefined.

54732 The *pthread_mutexattr_init*( ) function shall initialize a mutex attributes object *attr* with the
54733 default value for all of the attributes defined by the implementation.

54734 Results are undefined if *pthread_mutexattr_init*( ) is called specifying an already initialized *attr*
54735 attributes object.

54736 After a mutex attributes object has been used to initialize one or more mutexes, any function
54737 affecting the attributes object (including destruction) shall not affect any previously initialized
54738 mutexes.

54739 The behavior is undefined if the value specified by the *attr* argument to
54740 *pthread_mutexattr_destroy*( ) does not refer to an initialized mutex attributes object.

54741 **RETURN VALUE**

54742 Upon successful completion, *pthread_mutexattr_destroy*( ) and *pthread_mutexattr_init*( ) shall
54743 return zero; otherwise, an error number shall be returned to indicate the error.

54744 **ERRORS**

54745 The *pthread_mutexattr_init*( ) function shall fail if:

54746 [ENOMEM] Insufficient memory exists to initialize the mutex attributes object.

54747 These functions shall not return an error code of [EINTR].

54748 **EXAMPLES**

54749 None.

54750 **APPLICATION USAGE**

54751 None.

54752 **RATIONALE**

54753 If an implementation detects that the value specified by the *attr* argument to
54754 *pthread_mutexattr_destroy*( ) does not refer to an initialized mutex attributes object, it is
54755 recommended that the function should fail and report an [EINVAL] error.

54756 See *pthread_attr_destroy( )* for a general explanation of attributes. Attributes objects allow
54757 implementations to experiment with useful extensions and permit extension of this volume of
54758 POSIX.1-2017 without changing the existing functions. Thus, they provide for future
54759 extensibility of this volume of POSIX.1-2017 and reduce the temptation to standardize
54760 prematurely on semantics that are not yet widely implemented or understood.

54761 Examples of possible additional mutex attributes that have been discussed are *spin_only*,
54762 *limited_spin*, *no_spin*, *recursive*, and *metered*. (To explain what the latter attributes might mean:

  
```

recursive mutexes would allow for multiple re-locking by the current owner; metered mutexes would transparently keep records of queue length, wait time, and so on.) Since there is not yet wide agreement on the usefulness of these resulting from shared implementation and usage experience, they are not yet specified in this volume of POSIX.1-2017. Mutex attributes objects, however, make it possible to test out these concepts for possible standardization at a later time.

Mutex Attributes and Performance

Care has been taken to ensure that the default values of the mutex attributes have been defined such that mutexes initialized with the defaults have simple enough semantics so that the locking and unlocking can be done with the equivalent of a test-and-set instruction (plus possibly a few other basic instructions).

There is at least one implementation method that can be used to reduce the cost of testing at lock-time if a mutex has non-default attributes. One such method that an implementation can employ (and this can be made fully transparent to fully conforming POSIX applications) is to secretly pre-lock any mutexes that are initialized to non-default attributes. Any later attempt to lock such a mutex causes the implementation to branch to the ``slow path'' as if the mutex were unavailable; then, on the slow path, the implementation can do the ``real work'' to lock a non-default mutex. The underlying unlock operation is more complicated since the implementation never really wants to release the pre-lock on this kind of mutex. This illustrates that, depending on the hardware, there may be certain optimizations that can be used so that whatever mutex attributes are considered ``most frequently used'' can be processed most efficiently.

Process Shared Memory and Synchronization

The existence of memory mapping functions in this volume of POSIX.1-2017 leads to the possibility that an application may allocate the synchronization objects from this section in memory that is accessed by multiple processes (and therefore, by threads of multiple processes).

In order to permit such usage, while at the same time keeping the usual case (that is, usage within a single process) efficient, a *process-shared* option has been defined.

If an implementation supports the _POSIX_THREAD_PROCESS_SHARED option, then the *process-shared* attribute can be used to indicate that mutexes or condition variables may be accessed by threads of multiple processes.

The default setting of PTHREAD_PROCESS_PRIVATE has been chosen for the *process-shared* attribute so that the most efficient forms of these synchronization objects are created by default.

Synchronization variables that are initialized with the PTHREAD_PROCESS_PRIVATE *process-shared* attribute may only be operated on by threads in the process that initialized them. Synchronization variables that are initialized with the PTHREAD_PROCESS_SHARED *process-shared* attribute may be operated on by any thread in any process that has access to it. In particular, these processes may exist beyond the lifetime of the initializing process. For example, the following code implements a simple counting semaphore in a mapped file that may be used by many processes.

```
/* sem.h */
struct semaphore {
    pthread_mutex_t lock;
    pthread_cond_t nonzero;
    unsigned count;
};
typedef struct semaphore semaphore_t;
```

```
54808       semaphore_t *semaphore_create(char *semaphore_name);
54809       semaphore_t *semaphore_open(char *semaphore_name);
54810       void semaphore_post(semaphore_t *semap);
54811       void semaphore_wait(semaphore_t *semap);
54812       void semaphore_close(semaphore_t *semap);
54813       /* sem.c */
54814       #include <sys/types.h>
54815       #include <sys/stat.h>
54816       #include <sys/mman.h>
54817       #include <fcntl.h>
54818       #include <pthread.h>
54819       #include "sem.h"
54820       semaphore_t *
54821       semaphore_create(char *semaphore_name)
54822       {
54823       int fd;
54824           semaphore_t *semap;
54825           pthread_mutexattr_t psharedm;
54826           pthread_condattr_t psharedc;
54827           fd = open(semaphore_name, O_RDWR | O_CREAT | O_EXCL, 0666);
54828           if (fd < 0)
54829               return (NULL);
54830           (void) ftruncate(fd, sizeof(semaphore_t));
54831           (void) pthread_mutexattr_init(&psharedm);
54832           (void) pthread_mutexattr_setpshared(&psharedm,
54833               PTHREAD_PROCESS_SHARED);
54834           (void) pthread_condattr_init(&psharedc);
54835           (void) pthread_condattr_setpshared(&psharedc,
54836               PTHREAD_PROCESS_SHARED);
54837           semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
54838                   PROT_READ | PROT_WRITE, MAP_SHARED,
54839                   fd, 0);
54840           close (fd);
54841           (void) pthread_mutex_init(&semap->lock, &psharedm);
54842           (void) pthread_cond_init(&semap->nonzero, &psharedc);
54843           semap->count = 0;
54844           return (semap);
54845       }
54846       semaphore_t *
54847       semaphore_open(char *semaphore_name)
54848       {
54849           int fd;
54850           semaphore_t *semap;
54851           fd = open(semaphore_name, O_RDWR, 0666);
54852           if (fd < 0)
54853               return (NULL);
54854           semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
54855                   PROT_READ | PROT_WRITE, MAP_SHARED,
54856                   fd, 0);
```

```
54857            close (fd);
54858            return (semap);
54859        }
54860        void
54861        semaphore_post(semaphore_t *semap)
54862        {
54863            pthread_mutex_lock(&semap->lock);
54864            if (semap->count == 0)
54865                pthread_cond_signal(&semapx->nonzero);
54866            semap->count++;
54867            pthread_mutex_unlock(&semap->lock);
54868        }
54869        void
54870        semaphore_wait(semaphore_t *semap)
54871        {
54872            pthread_mutex_lock(&semap->lock);
54873            while (semap->count == 0)
54874                pthread_cond_wait(&semap->nonzero, &semap->lock);
54875            semap->count--;
54876            pthread_mutex_unlock(&semap->lock);
54877        }
54878        void
54879        semaphore_close(semaphore_t *semap)
54880        {
54881            munmap((void *) semap, sizeof(semaphore_t));
54882        }
```

54883 The following code is for three separate processes that create, post, and wait on a semaphore in
54884 the file **/tmp/semaphore**. Once the file is created, the post and wait programs increment and
54885 decrement the counting semaphore (waiting and waking as required) even though they did not
54886 initialize the semaphore.

```
54887        /* create.c */
54888        #include "pthread.h"
54889        #include "sem.h"
54890        int
54891        main()
54892        {
54893            semaphore_t *semap;
54894            semap = semaphore_create("/tmp/semaphore");
54895            if (semap == NULL)
54896                exit(1);
54897            semaphore_close(semap);
54898            return (0);
54899        }
54900        /* post */
54901        #include "pthread.h"
54902        #include "sem.h"
54903        int
```

```
54904         main()
54905         {
54906             semaphore_t *semap;
54907             semap = semaphore_open("/tmp/semaphore");
54908             if (semap == NULL)
54909                 exit(1);
54910             semaphore_post(semap);
54911             semaphore_close(semap);
54912             return (0);
54913         }
54914         /* wait */
54915         #include "pthread.h"

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_mutexattr_destroy*( ) and *pthread_mutexattr_init*( ) functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1c #27 is applied, updating the ERRORS section.

Issue 7

The *pthread_mutexattr_destroy*( ) and *pthread_mutexattr_init*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

54944 **NAME**

54945 pthread_mutexattr_getprioceiling, pthread_mutexattr_setprioceiling ‡′ get and set the
54946 prioceiling attribute of the mutex attributes object (**REALTIME THREADS**)

54947 **SYNOPSIS**

54948 RPP|TPP
```
#include <pthread.h>

int pthread_mutexattr_getprioceiling(const pthread_mutexattr_t
    *restrict attr, int *restrict prioceiling);
int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,
    int prioceiling);
```

54953 **DESCRIPTION**

54954 The *pthread_mutexattr_getprioceiling*( ) and *pthread_mutexattr_setprioceiling*( ) functions,
54955 respectively, shall get and set the priority ceiling attribute of a mutex attributes object pointed to
54956 by *attr* which was previously created by the function *pthread_mutexattr_init*( ).

54957 The *prioceiling* attribute contains the priority ceiling of initialized mutexes. The values of
54958 *prioceiling* are within the maximum range of priorities defined by SCHED_FIFO.

54959 The *prioceiling* attribute defines the priority ceiling of initialized mutexes, which is the minimum
54960 priority level at which the critical section guarded by the mutex is executed. In order to avoid
54961 priority inversion, the priority ceiling of the mutex shall be set to a priority higher than or equal
54962 to the highest priority of all the threads that may lock that mutex. The values of *prioceiling* are
54963 within the maximum range of priorities defined under the SCHED_FIFO scheduling policy.

54964 The behavior is undefined if the value specified by the *attr* argument to
54965 *pthread_mutexattr_getprioceiling*( ) or *pthread_mutexattr_setprioceiling*( ) does not refer to an
54966 initialized mutex attributes object.

54967 **RETURN VALUE**

54968 Upon successful completion, the *pthread_mutexattr_getprioceiling*( ) and
54969 *pthread_mutexattr_setprioceiling*( ) functions shall return zero; otherwise, an error number shall be
54970 returned to indicate the error.

54971 **ERRORS**

54972 These functions may fail if:

54973 [EINVAL] The value specified by *prioceiling* is invalid.

54974 [EPERM] The caller does not have the privilege to perform the operation.

54975 These functions shall not return an error code of [EINTR].

54976 **EXAMPLES**

54977 None.

54978 **APPLICATION USAGE**

54979 None.

54980 **RATIONALE**

54981 If an implementation detects that the value specified by the *attr* argument to
54982 *pthread_mutexattr_getprioceiling*( ) or *pthread_mutexattr_setprioceiling*( ) does not refer to an
54983 initialized mutex attributes object, it is recommended that the function should fail and report an
54984 [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Marked as part of the Realtime Threads Feature Group.

Issue 6

The *pthread_mutexattr_getprioceiling*( ) and *pthread_mutexattr_setprioceiling*( ) functions are marked as part of the Threads and Thread Priority Protection options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Priority Protection option.

The [ENOTSUP] error condition has been removed since these functions do not have a *protocol* argument.

The **restrict** keyword is added to the *pthread_mutexattr_getprioceiling*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *pthread_mutexattr_getprioceiling*( ) and *pthread_mutexattr_setprioceiling*( ) functions are moved from the Threads option to require support of either the Robust Mutex Priority Protection option or the Non-Robust Mutex Priority Protection option.

The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

55008 **NAME**

55009 pthread_mutexattr_getprotocol, pthread_mutexattr_setprotocol ‡' get and set the pøtocol
55010 attribute of the mutex attributes object (**REALTIME THREADS**)

55011 **SYNOPSIS**

55012 MC1
```
#include <pthread.h>

int pthread_mutexattr_getprotocol(const pthread_mutexattr_t
    *restrict attr, int *restrict protocol);
int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,
    int protocol);
```

55017 **DESCRIPTION**

55018 The *pthread_mutexattr_getprotocol*( ) and *pthread_mutexattr_setprotocol*( ) functions, respectively,
55019 shall get and set the protocol attribute of a mutex attributes object pointed to by *attr* which was
55020 previously created by the function *pthread_mutexattr_init*( ).

55021 The *protocol* attribute defines the protocol to be followed in utilizing mutexes. The value of
55022 *protocol* may be one of:

55023 RPI | TPI PTHREAD_PRIO_INHERIT
55024 MC1 PTHREAD_PRIO_NONE
55025 RPP | TPP PTHREAD_PRIO_PROTECT

55026 which are defined in the **<pthread.h>** header. The default value of the attribute shall be
55027 PTHREAD_PRIO_NONE.

55028 When a thread owns a mutex with the PTHREAD_PRIO_NONE *protocol* attribute, its priority
55029 and scheduling shall not be affected by its mutex ownership.

55030 RPI When a thread is blocking higher priority threads because of owning one or more robust
55031 mutexes with the PTHREAD_PRIO_INHERIT *protocol* attribute, it shall execute at the higher of
55032 its priority or the priority of the highest priority thread waiting on any of the robust mutexes
55033 owned by this thread and initialized with this protocol.

55034 TPI When a thread is blocking higher priority threads because of owning one or more non-robust
55035 mutexes with the PTHREAD_PRIO_INHERIT *protocol* attribute, it shall execute at the higher of
55036 its priority or the priority of the highest priority thread waiting on any of the non-robust
55037 mutexes owned by this thread and initialized with this protocol.

55038 RPP When a thread owns one or more robust mutexes initialized with the
55039 PTHREAD_PRIO_PROTECT protocol, it shall execute at the higher of its priority or the highest
55040 of the priority ceilings of all the robust mutexes owned by this thread and initialized with this
55041 attribute, regardless of whether other threads are blocked on any of these robust mutexes or not.

55042 TPP When a thread owns one or more non-robust mutexes initialized with the
55043 PTHREAD_PRIO_PROTECT protocol, it shall execute at the higher of its priority or the highest
55044 of the priority ceilings of all the non-robust mutexes owned by this thread and initialized with
55045 this attribute, regardless of whether other threads are blocked on any of these non-robust
55046 mutexes or not.

55047 While a thread is holding a mutex which has been initialized with the
55048 PTHREAD_PRIO_INHERIT or PTHREAD_PRIO_PROTECT protocol attributes, it shall not be
55049 subject to being moved to the tail of the scheduling queue at its priority in the event that its
55050 original priority is changed, such as by a call to *sched_setparam*( ). Likewise, when a thread

unlocks a mutex that has been initialized with the PTHREAD_PRIO_INHERIT or PTHREAD_PRIO_PROTECT protocol attributes, it shall not be subject to being moved to the tail of the scheduling queue at its priority in the event that its original priority is changed.

If a thread simultaneously owns several mutexes initialized with different protocols, it shall execute at the highest of the priorities that it would have obtained by each of these protocols.

RPI | TPI When a thread makes a call to *pthread_mutex_lock*( ), the mutex was initialized with the protocol attribute having the value PTHREAD_PRIO_INHERIT, when the calling thread is blocked because the mutex is owned by another thread, that owner thread shall inherit the priority level of the calling thread as long as it continues to own the mutex. The implementation shall update its execution priority to the maximum of its assigned priority and all its inherited priorities. Furthermore, if this owner thread itself becomes blocked on another mutex with the *protocol* attribute having the value PTHREAD_PRIO_INHERIT, the same priority inheritance effect shall be propagated to this other owner thread, in a recursive manner.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutexattr_getprotocol*( ) or *pthread_mutexattr_setprotocol*( ) does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, the *pthread_mutexattr_getprotocol*( ) and *pthread_mutexattr_setprotocol*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutexattr_setprotocol*( ) function shall fail if:

[ENOTSUP] The value specified by *protocol* is an unsupported value.

The *pthread_mutexattr_getprotocol*( ) and *pthread_mutexattr_setprotocol*( ) functions may fail if:

[EINVAL] The value specified by *protocol* is invalid.

[EPERM] The caller does not have the privilege to perform the operation.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_getprotocol*( ) or *pthread_mutexattr_setprotocol*( ) does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

55093 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

55094 Marked as part of the Realtime Threads Feature Group.

55095 **Issue 6**

55096 The *pthread_mutexattr_getprotocol*( ) and *pthread_mutexattr_setprotocol*( ) functions are marked as
55097 part of the Threads option and either the Thread Priority Protection or Thread Priority
55098 Inheritance options.

55099 The [ENOSYS] error condition has been removed as stubs need not be provided if an
55100 implementation does not support the Thread Priority Protection or Thread Priority Inheritance
55101 options.

55102 The **restrict** keyword is added to the *pthread_mutexattr_getprotocol*( ) prototype for alignment
55103 with the ISO/IEC 9899: 1999 standard.

55104 **Issue 7**

55105 SD5-XSH-ERN-135 is applied, updating the DESCRIPTION to define a default value for the
55106 *protocol* attribute.

55107 SD5-XSH-ERN-188 is applied, updating the DESCRIPTION.

55108 The *pthread_mutexattr_getprotocol*( ) and *pthread_mutexattr_setprotocol*( ) functions are moved from
55109 the Threads option to require support of either the Non-Robust Mutex Priority Protection option
55110 or the Non-Robust Mutex Priority Inheritance option or the Robust Mutex Priority Protection
55111 option or the Robust Mutex Priority Inheritance option.

55112 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition
55113 results in undefined behavior.

NAME

pthread_mutexattr_getpshared, pthread_mutexattr_setpshared ‡'get and set the pɒocess-shared attribute

SYNOPSIS

TSH

```
#include <pthread.h>

int pthread_mutexattr_getpshared(const pthread_mutexattr_t
    *restrict attr, int *restrict pshared);
int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
    int pshared);
```

DESCRIPTION

The *pthread_mutexattr_getpshared*( ) function shall obtain the value of the *process-shared* attribute from the attributes object referenced by *attr*.

The *pthread_mutexattr_setpshared*( ) function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

The *process-shared* attribute is set to PTHREAD_PROCESS_SHARED to permit a mutex to be operated upon by any thread that has access to the memory where the mutex is allocated, even if the mutex is allocated in memory that is shared by multiple processes. See Section 2.9.9 (on page 523) for further requirements. The default value of the attribute shall be PTHREAD_PROCESS_PRIVATE.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutexattr_getpshared*( ) or *pthread_mutexattr_setpshared*( ) does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, *pthread_mutexattr_setpshared*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, *pthread_mutexattr_getpshared*( ) shall return zero and store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutexattr_setpshared*( ) function may fail if:

[EINVAL] The new value specified for the attribute is outside the range of legal values for that attribute.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_getpshared*( ) or *pthread_mutexattr_setpshared*( ) does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_mutexattr_getpshared*( ) and *pthread_mutexattr_setpshared*( ) functions are marked as part of the Threads and Thread Process-Shared Synchronization options.

The **restrict** keyword is added to the *pthread_mutexattr_getpshared*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *pthread_mutexattr_getpshared*( ) and *pthread_mutexattr_setpshared*( ) functions are marked only as part of the Thread Process-Shared Synchronization option as the Threads option is now part of the Base.

The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0281 [972] and XSH/TC2-2008/0282 [757] are applied.

55176 **NAME**

55177 pthread_mutexattr_getrobust, pthread_mutexattr_setrobust ‡' get and set the mutex ɷbust
55178 attribute

55179 **SYNOPSIS**

55180 `#include <pthread.h>`

55181 `int pthread_mutexattr_getrobust(const pthread_mutexattr_t *restrict`
55182 `attr, int *restrict robust);`
55183 `int pthread_mutexattr_setrobust(pthread_mutexattr_t *attr,`
55184 `int robust);`

55185 **DESCRIPTION**

55186 The *pthread_mutexattr_getrobust*( ) and *pthread_mutexattr_setrobust*( ) functions, respectively, shall
55187 get and set the mutex *robust* attribute. This attribute is set in the *robust* parameter. Valid values
55188 for *robust* include:

55189 PTHREAD_MUTEX_STALLED

55190 No special actions are taken if the owner of the mutex is terminated while holding the
55191 mutex lock. This can lead to deadlocks if no other thread can unlock the mutex.
55192 This is the default value.

55193 PTHREAD_MUTEX_ROBUST

55194 If the process containing the owning thread of a robust mutex terminates while holding the
55195 mutex lock, the next thread that acquires the mutex shall be notified about the termination
55196 by the return value [EOWNERDEAD] from the locking function. If the owning thread of a
55197 robust mutex terminates while holding the mutex lock, the next thread that attempts to
55198 acquire the mutex may be notified about the termination by the return value
55199 [EOWNERDEAD]. The notified thread can then attempt to make the state protected by the
55200 mutex consistent again, and if successful can mark the mutex state as consistent by calling
55201 *pthread_mutex_consistent*( ). After a subsequent successful call to *pthread_mutex_unlock*( ), the
55202 mutex lock shall be released and can be used normally by other threads. If the mutex is
55203 unlocked without a call to *pthread_mutex_consistent*( ), it shall be in a permanently unusable
55204 state and all attempts to lock the mutex shall fail with the error [ENOTRECOVERABLE].
55205 The only permissible operation on such a mutex is *pthread_mutex_destroy*( ).

55206 The behavior is undefined if the value specified by the *attr* argument to
55207 *pthread_mutexattr_getrobust*( ) or *pthread_mutexattr_setrobust*( ) does not refer to an initialized
55208 mutex attributes object.

55209 **RETURN VALUE**

55210 Upon successful completion, the *pthread_mutexattr_getrobust*( ) function shall return zero and
55211 store the value of the *robust* attribute of *attr* into the object referenced by the *robust* parameter.
55212 Otherwise, an error value shall be returned to indicate the error. If successful, the
55213 *pthread_mutexattr_setrobust*( ) function shall return zero; otherwise, an error number shall be
55214 returned to indicate the error.

55215 **ERRORS**

55216 The *pthread_mutexattr_setrobust*( ) function shall fail if:

55217 [EINVAL] The value of *robust* is invalid.

55218 These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

The actions required to make the state protected by the mutex consistent again are solely dependent on the application. If it is not possible to make the state of a mutex consistent, robust mutexes can be used to notify this situation by calling *pthread_mutex_unlock*( ) without a prior call to *pthread_mutex_consistent*( ).

If the state is declared inconsistent by calling *pthread_mutex_unlock*( ) without a prior call to *pthread_mutex_consistent*( ), a possible approach could be to destroy the mutex and then reinitialize it. However, it should be noted that this is possible only in certain situations where the state protected by the mutex has to be reinitialized and coordination achieved with other threads blocked on the mutex, because otherwise a call to a locking function with a reference to a mutex object invalidated by a call to *pthread_mutex_destroy*( ) results in undefined behavior.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_getrobust*( ) or *pthread_mutexattr_setrobust*( ) does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 7.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0283 [748] is applied.

55245 **NAME**

55246 pthread_mutexattr_gettype, pthread_mutexattr_settype — get and set the mutex type attribute

55247 **SYNOPSIS**

55248 ```
#include <pthread.h>

int pthread_mutexattr_gettype(const pthread_mutexattr_t *restrict attr,
    int *restrict type);
int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type);
```

55252 **DESCRIPTION**

55253 The *pthread_mutexattr_gettype*( ) and *pthread_mutexattr_settype*( ) functions, respectively, shall get
55254 and set the mutex *type* attribute. This attribute is set in the *type* parameter to these functions. The
55255 default value of the *type* attribute is PTHREAD_MUTEX_DEFAULT.

55256 The type of mutex is contained in the *type* attribute of the mutex attributes. Valid mutex types
55257 include:

55258 PTHREAD_MUTEX_NORMAL
55259 PTHREAD_MUTEX_ERRORCHECK
55260 PTHREAD_MUTEX_RECURSIVE
55261 PTHREAD_MUTEX_DEFAULT

55262 The mutex type affects the behavior of calls which lock and unlock the mutex. See
55263 *pthread_mutex_lock*( ) for details. An implementation may map PTHREAD_MUTEX_DEFAULT
55264 to one of the other mutex types.

55265 The behavior is undefined if the value specified by the *attr* argument to
55266 *pthread_mutexattr_gettype*( ) or *pthread_mutexattr_settype*( ) does not refer to an initialized mutex
55267 attributes object.

55268 **RETURN VALUE**

55269 Upon successful completion, the *pthread_mutexattr_gettype*( ) function shall return zero and store
55270 the value of the *type* attribute of *attr* into the object referenced by the *type* parameter. Otherwise,
55271 an error shall be returned to indicate the error.

55272 If successful, the *pthread_mutexattr_settype*( ) function shall return zero; otherwise, an error
55273 number shall be returned to indicate the error.

55274 **ERRORS**

55275 The *pthread_mutexattr_settype*( ) function shall fail if:

55276 [EINVAL] The value *type* is invalid.

55277 These functions shall not return an error code of [EINTR].

55278 **EXAMPLES**

55279 None.

55280 **APPLICATION USAGE**

55281 It is advised that an application should not use a PTHREAD_MUTEX_RECURSIVE mutex with
55282 condition variables because the implicit unlock performed for a *pthread_cond_timedwait*( ) or
55283 *pthread_cond_wait*( ) may not actually release the mutex (if it had been locked multiple times). If
55284 this happens, no other thread can satisfy the condition of the predicate.

55285 **RATIONALE**

55286 If an implementation detects that the value specified by the *attr* argument to
55287 *pthread_mutexattr_gettype*( ) or *pthread_mutexattr_settype*( ) does not refer to an initialized mutex
55288 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

  
```

55289 **FUTURE DIRECTIONS**

55290 None.

55291 **SEE ALSO**

55292 *pthread_cond_timedwait*( ), *pthread_mutex_lock*( )

55293 XBD **<pthread.h>**

55294 **CHANGE HISTORY**

55295 First released in Issue 5.

55296 **Issue 6**

55297 The Open Group Corrigendum U033/3 is applied. The SYNOPSIS for
55298 *pthread_mutexattr_gettype*( ) is updated so that the first argument is of type **const**
55299 **pthread_mutexattr_t** *.

55300 The **restrict** keyword is added to the *pthread_mutexattr_gettype*( ) prototype for alignment with
55301 the ISO/IEC 9899:1999 standard.

55302 **Issue 7**

55303 The *pthread_mutexattr_gettype*( ) and *pthread_mutexattr_settype*( ) functions are moved from the
55304 XSI option to the Base.

55305 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition
55306 results in undefined behavior.

55307 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0464 [121] is applied.

55308 **NAME**

55309 pthread_mutexattr_init — initialize the mutex attributes object

55310 **SYNOPSIS**

55311 `#include <pthread.h>`

55312 `int pthread_mutexattr_init(pthread_mutexattr_t *attr);`

55313 **DESCRIPTION**

55314 Refer to *pthread_mutexattr_destroy( )*.

NAME

pthread_mutexattr_setprioceiling ‡′set the prioceiling attribute of the mutex attributes object (**REALTIME THREADS**)

SYNOPSIS

RPP|TPP

```
#include <pthread.h>

int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,
    int prioceiling);
```

DESCRIPTION

Refer to *pthread_mutexattr_getprioceiling( )*.

55324 **NAME**

55325 pthread_mutexattr_setprotocol ‡' set the protocol attribute of the mutex attributes object
55326 (**REALTIME THREADS**)

55327 **SYNOPSIS**

55328 MC1
```
#include <pthread.h>

int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,
    int protocol);
```

55331 **DESCRIPTION**

55332 Refer to *pthread_mutexattr_getprotocol( )*.

NAME

pthread_mutexattr_setpshared — set the process-shared attribute

SYNOPSIS

TSH

```
#include <pthread.h>

int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
    int pshared);
```

DESCRIPTION

Refer to *pthread_mutexattr_getpshared( )*.

55341 **NAME**

55342 pthread_mutexattr_setrobust — get and set the mutex robust attribute

55343 **SYNOPSIS**

55344 ```
#include <pthread.h>
```

55345 ```
int pthread_mutexattr_setrobust(pthread_mutexattr_t *attr,
```

55346 ```
    int robust);
```

55347 **DESCRIPTION**

55348 Refer to *pthread_mutexattr_getrobust( )*.

  
```

55349 **NAME**

55350 pthread_mutexattr_settype — set the mutex type attribute

55351 **SYNOPSIS**

55352 `#include <pthread.h>`

55353 `int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type);`

55354 **DESCRIPTION**

55355 Refer to *pthread_mutexattr_gettype( )*.

55356 **NAME**

55357 pthread_once — dynamic package initialization

55358 **SYNOPSIS**

55359 ```
#include <pthread.h>
```

55360 ```
int pthread_once(pthread_once_t *once_control,
```

55361 ```
    void (*init_routine)(void));
```

55362 ```
pthread_once_t once_control = PTHREAD_ONCE_INIT;
```

55363 **DESCRIPTION**

55364 The first call to *pthread_once*( ) by any thread in a process, with a given *once_control*, shall call the
55365 *init_routine* with no arguments. Subsequent calls of *pthread_once*( ) with the same *once_control*
55366 shall not call the *init_routine*. On return from *pthread_once*( ), *init_routine* shall have completed.
55367 The *once_control* parameter shall determine whether the associated initialization routine has been
55368 called.

55369 The *pthread_once*( ) function is not a cancellation point. However, if *init_routine* is a cancellation
55370 point and is canceled, the effect on *once_control* shall be as if *pthread_once*( ) was never called.

55371 If the call to *init_routine* is terminated by a call to *longjmp*( ), *_longjmp*( ), or *siglongjmp*( ), the
55372 behavior is undefined.

55373 The constant PTHREAD_ONCE_INIT is defined in the **<pthread.h>** header.

55374 The behavior of *pthread_once*( ) is undefined if *once_control* has automatic storage duration or is
55375 not initialized by PTHREAD_ONCE_INIT.

55376 **RETURN VALUE**

55377 Upon successful completion, *pthread_once*( ) shall return zero; otherwise, an error number shall
55378 be returned to indicate the error.

55379 **ERRORS**

55380 The *pthread_once*( ) function shall not return an error code of [EINTR].

55381 **EXAMPLES**

55382 None.

55383 **APPLICATION USAGE**

55384 If *init_routine* recursively calls *pthread_once*( ) with the same *once_control*, the recursive call will
55385 not call the specified *init_routine*, and thus the specified *init_routine* will not complete, and thus
55386 the recursive call to *pthread_once*( ) will not return. Use of *longjmp*( ), *_longjmp*( ), or *siglongjmp*( )
55387 within an *init_routine* to jump to a point outside of *init_routine* prevents *init_routine* from
55388 returning.

55389 **RATIONALE**

55390 Some C libraries are designed for dynamic initialization. That is, the global initialization for the
55391 library is performed when the first procedure in the library is called. In a single-threaded
55392 program, this is normally implemented using a static variable whose value is checked on entry
55393 to a routine, as follows:

55394 ```
static int random_is_initialized = 0;
```

55395 ```
extern void initialize_random(void);
```

55396 ```
int random_function()
```

55397 ```
{
```

55398 ```
    if (random_is_initialized == 0) {
```

55399 ```
        initialize_random();
```

55400 ```
        random_is_initialized = 1;
```

  
```

```
    }
    ... /* Operations performed after initialization. */
}
```

To keep the same structure in a multi-threaded program, a new primitive is needed. Otherwise, library initialization has to be accomplished by an explicit call to a library-exported initialization function prior to any use of the library.

For dynamic library initialization in a multi-threaded process, if an initialization flag is used the flag needs to be protected against modification by multiple threads simultaneously calling into the library. This can be done by using a mutex (initialized by assigning PTHREAD_MUTEX_INITIALIZER). However, the better solution is to use *pthread_once*( ) which is designed for exactly this purpose, as follows:

```
#include <pthread.h>
static pthread_once_t random_is_initialized = PTHREAD_ONCE_INIT;
extern void initialize_random(void);

int random_function()
{
    (void) pthread_once(&random_is_initialized, initialize_random);
    ... /* Operations performed after initialization. */
}
```

If an implementation detects that the value specified by the *once_control* argument to *pthread_once*( ) does not refer to a **pthread_once_t** object initialized by PTHREAD_ONCE_INIT, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_once*( ) function is marked as part of the Threads option.

The [EINVAL] error is added as a ``may fail'' case for if either argument is invalid.

Issue 7

The *pthread_once*( ) function is moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized **pthread_once_t** object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0284 [863], XSH/TC2-2008/0285 [874], XSH/TC2-2008/0286 [874], and XSH/TC2-2008/0287 [747] are applied.

55438 **NAME**

55439 pthread_rwlock_destroy, pthread_rwlock_init — destroy and initialize a read-write lock object

55440 **SYNOPSIS**

55441 ```
#include <pthread.h>

int pthread_rwlock_destroy(pthread_rwlock_t *rwlock);
int pthread_rwlock_init(pthread_rwlock_t *restrict rwlock,
    const pthread_rwlockattr_t *restrict attr);
pthread_rwlock_t rwlock = PTHREAD_RWLOCK_INITIALIZER;
```

55446 **DESCRIPTION**

55447 The *pthread_rwlock_destroy*( ) function shall destroy the read-write lock object referenced by
55448 *rwlock* and release any resources used by the lock. The effect of subsequent use of the lock is
55449 undefined until the lock is reinitialized by another call to *pthread_rwlock_init*( ). An
55450 implementation may cause *pthread_rwlock_destroy*( ) to set the object referenced by *rwlock* to an
55451 invalid value. Results are undefined if *pthread_rwlock_destroy*( ) is called when any thread holds
55452 *rwlock*. Attempting to destroy an uninitialized read-write lock results in undefined behavior.

55453 The *pthread_rwlock_init*( ) function shall allocate any resources required to use the read-write lock
55454 referenced by *rwlock* and initializes the lock to an unlocked state with attributes referenced by
55455 *attr*. If *attr* is NULL, the default read-write lock attributes shall be used; the effect is the same as
55456 passing the address of a default read-write lock attributes object. Once initialized, the lock can be
55457 used any number of times without being reinitialized. Results are undefined if
55458 *pthread_rwlock_init*( ) is called specifying an already initialized read-write lock. Results are
55459 undefined if a read-write lock is used without first being initialized.

55460 If the *pthread_rwlock_init*( ) function fails, *rwlock* shall not be initialized and the contents of *rwlock*
55461 are undefined.

55462 See Section 2.9.9 (on page 523) for further requirements.

55463 In cases where default read-write lock attributes are appropriate, the macro
55464 PTHREAD_RWLOCK_INITIALIZER can be used to initialize read-write locks. The effect shall
55465 be equivalent to dynamic initialization by a call to *pthread_rwlock_init*( ) with the *attr* parameter
55466 specified as NULL, except that no error checks are performed.

55467 The behavior is undefined if the value specified by the *attr* argument to *pthread_rwlock_init*( )
55468 does not refer to an initialized read-write lock attributes object.

55469 **RETURN VALUE**

55470 If successful, the *pthread_rwlock_destroy*( ) and *pthread_rwlock_init*( ) functions shall return zero;
55471 otherwise, an error number shall be returned to indicate the error.

55472 **ERRORS**

55473 The *pthread_rwlock_init*( ) function shall fail if:

55474 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize
55475 another read-write lock.

55476 [ENOMEM] Insufficient memory exists to initialize the read-write lock.

55477 [EPERM] The caller does not have the privilege to perform the operation.

55478 These functions shall not return an error code of [EINTR].

  
```

EXAMPLES

None.

APPLICATION USAGE

Applications using these and related read-write lock functions may be subject to priority inversion, as discussed in XBD Section 3.291 (on page 80).

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_destroy*( ) does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *attr* argument to *pthread_rwlock_init*( ) does not refer to an initialized read-write lock attributes object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_destroy*( ) or *pthread_rwlock_init*( ) refers to a locked read-write lock object, or detects that the value specified by the *rwlock* argument to *pthread_rwlock_init*( ) refers to an already initialized read-write lock object, it is recommended that the function should fail and report an [EBUSY] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_rwlock_rdlock( ), *pthread_rwlock_timedrdlock*( ), *pthread_rwlock_timedwrlock*( ), *pthread_rwlock_trywrlock*( ), *pthread_rwlock_unlock*( )

XBD Section 3.291 (on page 80), **<pthread.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension). The initializer macro is also deleted from the SYNOPSIS.
- The DESCRIPTION is updated as follows:
  - ‡ ’eExplicitly notes allocation of resources upon initialization of a read-write lock object.
  - ‡ ’pAragraph is added specifying that copies of read-write lock objects may not be used.
- An [EINVAL] error is added to the ERRORS section for *pthread_rwlock_init*( ), indicating that the *rwlock* value is invalid.
- The SEE ALSO section is updated.

The **restrict** keyword is added to the *pthread_rwlock_init*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/45 is applied, adding APPLICATION USAGE relating to priority inversion.

Issue 7

Austin Group Interpretation 1003.1-2001 #048 is applied, adding the PTHREAD_RWLOCK_INITIALIZER macro.

The *pthread_rwlock_destroy*( ) and *pthread_rwlock_init*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized read-write lock object or read-write lock attributes object is removed; this condition results in undefined behavior.

The [EBUSY] error for a locked read-write lock object or an already initialized read-write lock object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0465 [70] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0288 [972] and XSH/TC2-2008/0289 [758] are applied.

NAME

pthread_rwlock_rdlock, pthread_rwlock_tryrdlock — lock a read-write lock object for reading

SYNOPSIS

```
#include <pthread.h>

int pthread_rwlock_rdlock(pthread_rwlock_t *rwlock);
int pthread_rwlock_tryrdlock(pthread_rwlock_t *rwlock);
```

DESCRIPTION

The *pthread_rwlock_rdlock*( ) function shall apply a read lock to the read-write lock referenced by *rwlock*. The calling thread acquires the read lock if a writer does not hold the lock and there are no writers blocked on the lock.

TPS If the Thread Execution Scheduling option is supported, and the threads involved in the lock are executing with the scheduling policies SCHED_FIFO or SCHED_RR, the calling thread shall not acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on the lock; otherwise, the calling thread shall acquire the lock.

TPS TSP If the Thread Execution Scheduling option is supported, and the threads involved in the lock are executing with the SCHED_SPORADIC scheduling policy, the calling thread shall not acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on the lock; otherwise, the calling thread shall acquire the lock.

If the Thread Execution Scheduling option is not supported, it is implementation-defined whether the calling thread acquires the lock when a writer does not hold the lock and there are writers blocked on the lock. If a writer holds the lock, the calling thread shall not acquire the read lock. If the read lock is not acquired, the calling thread shall block until it can acquire the lock. The calling thread may deadlock if at the time the call is made it holds a write lock.

A thread may hold multiple concurrent read locks on *rwlock* (that is, successfully call the *pthread_rwlock_rdlock*( ) function *n* times). If so, the application shall ensure that the thread performs matching unlocks (that is, it calls the *pthread_rwlock_unlock*( ) function *n* times).

The maximum number of simultaneous read locks that an implementation guarantees can be applied to a read-write lock shall be implementation-defined. The *pthread_rwlock_rdlock*( ) function may fail if this maximum would be exceeded.

The *pthread_rwlock_tryrdlock*( ) function shall apply a read lock as in the *pthread_rwlock_rdlock*( ) function, with the exception that the function shall fail if the equivalent *pthread_rwlock_rdlock*( ) call would have blocked the calling thread. In no case shall the *pthread_rwlock_tryrdlock*( ) function ever block; it always either acquires the lock or fails and returns immediately.

Results are undefined if any of these functions are called with an uninitialized read-write lock.

If a signal is delivered to a thread waiting for a read-write lock for reading, upon return from the signal handler the thread resumes waiting for the read-write lock for reading as if it was not interrupted.

RETURN VALUE

If successful, the *pthread_rwlock_rdlock*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

The *pthread_rwlock_tryrdlock*( ) function shall return zero if the lock for reading on the read-write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlock_tryrdlock*( ) function shall fail if:

[EBUSY] The read-write lock could not be acquired for reading because a writer holds the lock or a writer with the appropriate priority was blocked on it.

The *pthread_rwlock_rdlock*( ) and *pthread_rwlock_tryrdlock*( ) functions may fail if:

[EAGAIN] The read lock could not be acquired because the maximum number of read locks for *rwlock* has been exceeded.

The *pthread_rwlock_rdlock*( ) function may fail if:

[EDEADLK] A deadlock condition was detected or the current thread already owns the read-write lock for writing.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in XBD Section 3.291 (on page 80).

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_rdlock*( ) or *pthread_rwlock_tryrdlock*( ) does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

XBD Section 3.291 (on page 80), Section 4.12 (on page 111), **<pthread.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).

The DESCRIPTION is updated as follows:

- Conditions under which writers have precedence over readers are specified.
- Failure of *pthread_rwlock_tryrdlock*( ) is clarified.
- A paragraph on the maximum number of read locks is added.

In the ERRORS sections, [EBUSY] is modified to take into account write priority, and [EDEADLK] is deleted as a *pthread_rwlock_tryrdlock*( ) error.

The SEE ALSO section is updated.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/101 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_rwlock_rdlock*( ) and *pthread_rwlock_tryrdlock*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

NAME

pthread_rwlock_timedrdlock — lock a read-write lock for reading

SYNOPSIS

```
#include <pthread.h>
#include <time.h>

int pthread_rwlock_timedrdlock(pthread_rwlock_t *restrict rwlock,
    const struct timespec *restrict abstime);
```

DESCRIPTION

The *pthread_rwlock_timedrdlock*( ) function shall apply a read lock to the read-write lock referenced by *rwlock* as in the *pthread_rwlock_rdlock*( ) function. However, if the lock cannot be acquired without waiting for other threads to unlock the lock, this wait shall be terminated when the specified timeout expires. The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the CLOCK_REALTIME clock. The **timespec** data type is defined in the **<time.h>** header. Under no circumstances shall the function fail with a timeout if the lock can be acquired immediately. The validity of the *abstime* parameter need not be checked if the lock can be immediately acquired.

If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-write lock via a call to *pthread_rwlock_timedrdlock*( ), upon return from the signal handler the thread shall resume waiting for the lock as if it was not interrupted.

The calling thread may deadlock if at the time the call is made it holds a write lock on *rwlock*. The results are undefined if this function is called with an uninitialized read-write lock.

RETURN VALUE

The *pthread_rwlock_timedrdlock*( ) function shall return zero if the lock for reading on the read-write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlock_timedrdlock*( ) function shall fail if:

[ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

The *pthread_rwlock_timedrdlock*( ) function may fail if:

[EAGAIN] The read lock could not be acquired because the maximum number of read locks for lock would be exceeded.

[EDEADLK] A deadlock condition was detected or the calling thread already holds a write lock on *rwlock*.

[EINVAL] The *abstime* nanosecond value is less than zero or greater than or equal to 1 000 million.

This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using this function may be subject to priority inversion, as discussed in XBD Section 3.291 (on page 80).

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_timedrdlock*( ) does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

XBD Section 3.291 (on page 80), Section 4.12 (on page 111), **<pthread.h>**, **<time.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/102 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_rwlock_timedrdlock*( ) function is moved from the Timeouts option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

55687 **NAME**

55688 pthread_rwlock_timedwrlock — lock a read-write lock for writing

55689 **SYNOPSIS**

55690 ```
#include <pthread.h>
```

55691 ```
#include <time.h>
```

55692 ```
int pthread_rwlock_timedwrlock(pthread_rwlock_t *restrict rwlock,
```

55693 ```
    const struct timespec *restrict abstime);
```

55694 **DESCRIPTION**

55695 The *pthread_rwlock_timedwrlock*( ) function shall apply a write lock to the read-write lock
55696 referenced by *rwlock* as in the *pthread_rwlock_wrlock*( ) function. However, if the lock cannot be
55697 acquired without waiting for other threads to unlock the lock, this wait shall be terminated
55698 when the specified timeout expires. The timeout shall expire when the absolute time specified
55699 by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value
55700 of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already
55701 been passed at the time of the call.

55702 The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall
55703 be the resolution of the CLOCK_REALTIME clock. The **timespec** data type is defined in the
55704 **<time.h>** header. Under no circumstances shall the function fail with a timeout if the lock can be
55705 acquired immediately. The validity of the *abstime* parameter need not be checked if the lock can
55706 be immediately acquired.

55707 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-
55708 write lock via a call to *pthread_rwlock_timedwrlock*( ), upon return from the signal handler the
55709 thread shall resume waiting for the lock as if it was not interrupted.

55710 The calling thread may deadlock if at the time the call is made it holds the read-write lock. The
55711 results are undefined if this function is called with an uninitialized read-write lock.

55712 **RETURN VALUE**

55713 The *pthread_rwlock_timedwrlock*( ) function shall return zero if the lock for writing on the read-
55714 write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned
55715 to indicate the error.

55716 **ERRORS**

55717 The *pthread_rwlock_timedwrlock*( ) function shall fail if:

55718 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

55719 The *pthread_rwlock_timedwrlock*( ) function may fail if:

55720 [EDEADLK] A deadlock condition was detected or the calling thread already holds the
55721 *rwlock*.

55722 [EINVAL] The *abstime* nanosecond value is less than zero or greater than or equal to 1 000
55723 million.

55724 This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using this function may be subject to priority inversion, as discussed in XBD Section 3.291 (on page 80).

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_timedwrlock*( ) does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

XBD Section 3.291 (on page 80), Section 4.12 (on page 111), **<pthread.h>**, **<time.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/103 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_rwlock_timedwrlock*( ) function is moved from the Timeouts option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

55748 **NAME**

55749 pthread_rwlock_tryrdlock — lock a read-write lock object for reading

55750 **SYNOPSIS**

55751 `#include <pthread.h>`

55752 `int pthread_rwlock_tryrdlock(pthread_rwlock_t *rwlock);`

55753 **DESCRIPTION**

55754 Refer to *pthread_rwlock_rdlock( )*.

55755 **NAME**

55756 pthread_rwlock_trywrlock, pthread_rwlock_wrlock — lock a read-write lock object for writing

55757 **SYNOPSIS**

55758 ```
#include <pthread.h>
```

55759 ```
int pthread_rwlock_trywrlock(pthread_rwlock_t *rwlock);
```
55760 ```
int pthread_rwlock_wrlock(pthread_rwlock_t *rwlock);
```

55761 **DESCRIPTION**

55762 The *pthread_rwlock_trywrlock*( ) function shall apply a write lock like the *pthread_rwlock_wrlock*( )
55763 function, with the exception that the function shall fail if any thread currently holds *rwlock* (for
55764 reading or writing).

55765 The *pthread_rwlock_wrlock*( ) function shall apply a write lock to the read-write lock referenced by
55766 *rwlock*. The calling thread shall acquire the write lock if no thread (reader or writer) holds the
55767 read-write lock *rwlock*. Otherwise, if another thread holds the read-write lock *rwlock*, the calling
55768 thread shall block until it can acquire the lock. If a deadlock condition occurs or the calling
55769 thread already owns the read-write lock for writing or reading, the call shall either deadlock or
55770 return [EDEADLK].

55771 Results are undefined if any of these functions are called with an uninitialized read-write lock.

55772 If a signal is delivered to a thread waiting for a read-write lock for writing, upon return from the
55773 signal handler the thread resumes waiting for the read-write lock for writing as if it was not
55774 interrupted.

55775 **RETURN VALUE**

55776 The *pthread_rwlock_trywrlock*( ) function shall return zero if the lock for writing on the read-write
55777 lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to
55778 indicate the error.

55779 If successful, the *pthread_rwlock_wrlock*( ) function shall return zero; otherwise, an error number
55780 shall be returned to indicate the error.

55781 **ERRORS**

55782 The *pthread_rwlock_trywrlock*( ) function shall fail if:

55783 [EBUSY] The read-write lock could not be acquired for writing because it was already
55784 locked for reading or writing.

55785 The *pthread_rwlock_wrlock*( ) function may fail if:

55786 [EDEADLK] A deadlock condition was detected or the current thread already owns the
55787 read-write lock for writing or reading.

55788 These functions shall not return an error code of [EINTR].

55789 **EXAMPLES**

55790 None.

55791 **APPLICATION USAGE**

55792 Applications using these functions may be subject to priority inversion, as discussed in XBD
55793 Section 3.291 (on page 80).

55794 **RATIONALE**

55795 If an implementation detects that the value specified by the *rwlock* argument to
55796 *pthread_rwlock_trywrlock*( ) or *pthread_rwlock_wrlock*( ) does not refer to an initialized read-write
55797 lock object, it is recommended that the function should fail and report an [EINVAL] error.

  
```

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The [EDEADLK] error is deleted as a *pthread_rwlock_trywrlock*( ) error.
- The SEE ALSO section is updated.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/104 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_rwlock_trywrlock*( ) and *pthread_rwlock_wrlock*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0290 [720] and XSH/TC2-2008/0291 [722] are applied.

55822 **NAME**

55823 pthread_rwlock_unlock — unlock a read-write lock object

55824 **SYNOPSIS**

55825 `#include <pthread.h>`

55826 `int pthread_rwlock_unlock(pthread_rwlock_t *rwlock);`

55827 **DESCRIPTION**

55828 The *pthread_rwlock_unlock*( ) function shall release a lock held on the read-write lock object
55829 referenced by *rwlock*. Results are undefined if the read-write lock *rwlock* is not held by the
55830 calling thread.

55831 If this function is called to release a read lock from the read-write lock object and there are other
55832 read locks currently held on this read-write lock object, the read-write lock object remains in the
55833 read locked state. If this function releases the last read lock for this read-write lock object, the
55834 read-write lock object shall be put in the unlocked state with no owners.

55835 If this function is called to release a write lock for this read-write lock object, the read-write lock
55836 object shall be put in the unlocked state.

55837 If there are threads blocked on the lock when it becomes available, the scheduling policy shall
55838 TPS determine which thread(s) shall acquire the lock. If the Thread Execution Scheduling option is
55839 supported, when threads executing with the scheduling policies SCHED_FIFO, SCHED_RR, or
55840 SCHED_SPORADIC are waiting on the lock, they shall acquire the lock in priority order when
55841 the lock becomes available. For equal priority threads, write locks shall take precedence over
55842 read locks. If the Thread Execution Scheduling option is not supported, it is implementation-
55843 defined whether write locks take precedence over read locks.

55844 Results are undefined if this function is called with an uninitialized read-write lock.

55845 **RETURN VALUE**

55846 If successful, the *pthread_rwlock_unlock*( ) function shall return zero; otherwise, an error number
55847 shall be returned to indicate the error.

55848 **ERRORS**

55849 The *pthread_rwlock_unlock*( ) function shall not return an error code of [EINTR].

55850 **EXAMPLES**

55851 None.

55852 **APPLICATION USAGE**

55853 None.

55854 **RATIONALE**

55855 If an implementation detects that the value specified by the *rwlock* argument to
55856 *pthread_rwlock_unlock*( ) does not refer to an initialized read-write lock object, it is recommended
55857 that the function should fail and report an [EINVAL] error.

55858 If an implementation detects that the value specified by the *rwlock* argument to
55859 *pthread_rwlock_unlock*( ) refers to a read-write lock object for which the current thread does not
55860 hold a lock, it is recommended that the function should fail and report an [EPERM] error.

55861 **FUTURE DIRECTIONS**

55862 None.

SEE ALSO

pthread_rwlock_destroy( ), *pthread_rwlock_rdlock*( ), *pthread_rwlock_timedrdlock*( ), *pthread_rwlock_timedwrlock*( ), *pthread_rwlock_trywrlock*( )

XBD Section 4.12 (on page 111), **<pthread.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).

The DESCRIPTION is updated as follows:

‡ The conditions under which writers have precedence over readers are specified.

‡ The concept of read-write lock owner is deleted.

The SEE ALSO section is updated.

Issue 7

SD5-XSH-ERN-183 is applied.

The *pthread_rwlock_unlock*( ) function is moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

The [EPERM] error for a read-write lock object for which the current thread does not hold a lock is removed; this condition results in undefined behavior.

55885 **NAME**

55886 pthread_rwlock_wrlock — lock a read-write lock object for writing

55887 **SYNOPSIS**

55888 `#include <pthread.h>`

55889 `int pthread_rwlock_wrlock(pthread_rwlock_t *rwlock);`

55890 **DESCRIPTION**

55891 Refer to *pthread_rwlock_trywrlock( )*.

55892 **NAME**

55893 pthread_rwlockattr_destroy, pthread_rwlockattr_init ‡′ destroy and initialize the read-write
55894 lock attributes object

55895 **SYNOPSIS**

55896 `#include <pthread.h>`

55897 `int pthread_rwlockattr_destroy(pthread_rwlockattr_t *attr);`
55898 `int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);`

55899 **DESCRIPTION**

55900 The *pthread_rwlockattr_destroy*( ) function shall destroy a read-write lock attributes object. A
55901 destroyed *attr* attributes object can be reinitialized using *pthread_rwlockattr_init*( ); the results of
55902 otherwise referencing the object after it has been destroyed are undefined. An implementation
55903 may cause *pthread_rwlockattr_destroy*( ) to set the object referenced by *attr* to an invalid value.

55904 The *pthread_rwlockattr_init*( ) function shall initialize a read-write lock attributes object *attr* with
55905 the default value for all of the attributes defined by the implementation.

55906 Results are undefined if *pthread_rwlockattr_init*( ) is called specifying an already initialized *attr*
55907 attributes object.

55908 After a read-write lock attributes object has been used to initialize one or more read-write locks,
55909 any function affecting the attributes object (including destruction) shall not affect any previously
55910 initialized read-write locks.

55911 The behavior is undefined if the value specified by the *attr* argument to
55912 *pthread_rwlockattr_destroy*( ) does not refer to an initialized read-write lock attributes object.

55913 **RETURN VALUE**

55914 If successful, the *pthread_rwlockattr_destroy*( ) and *pthread_rwlockattr_init*( ) functions shall return
55915 zero; otherwise, an error number shall be returned to indicate the error.

55916 **ERRORS**

55917 The *pthread_rwlockattr_init*( ) function shall fail if:

55918 [ENOMEM] Insufficient memory exists to initialize the read-write lock attributes object.

55919 These functions shall not return an error code of [EINTR].

55920 **EXAMPLES**

55921 None.

55922 **APPLICATION USAGE**

55923 None.

55924 **RATIONALE**

55925 If an implementation detects that the value specified by the *attr* argument to
55926 *pthread_rwlockattr_destroy*( ) does not refer to an initialized read-write lock attributes object, it is
55927 recommended that the function should fail and report an [EINVAL] error.

55928 **FUTURE DIRECTIONS**

55929 None.

55930 **SEE ALSO**

55931 *pthread_rwlock_destroy*( ), *pthread_rwlockattr_getpshared*( )

55932 XBD **<pthread.h>**

55933 **CHANGE HISTORY**

55934 First released in Issue 5.

55935 **Issue 6**

55936 The following changes are made for alignment with IEEE Std 1003.1j-2000:

55937 The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is
55938 now part of the Threads option (previously it was part of the Read-Write Locks option in
55939 IEEE Std 1003.1j-2000 and also part of the XSI extension).

55940 The SEE ALSO section is updated.

55941 **Issue 7**

55942 The *pthread_rwlockattr_destroy*( ) and *pthread_rwlockattr_init*( ) functions are moved from the
55943 Threads option to the Base.

55944 The [EINVAL] error for an uninitialized read-write lock attributes object is removed; this
55945 condition results in undefined behavior.

55946 **NAME**

55947 pthread_rwlockattr_getpshared, pthread_rwlockattr_setpshared ‡' get and set the process-
55948 shared attribute of the read-write lock attributes object

55949 **SYNOPSIS**

55950 TSH
```
#include <pthread.h>

int pthread_rwlockattr_getpshared(const pthread_rwlockattr_t
    *restrict attr, int *restrict pshared);
int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
    int pshared);
```

55955 **DESCRIPTION**

55956 The *pthread_rwlockattr_getpshared*( ) function shall obtain the value of the *process-shared* attribute
55957 from the initialized attributes object referenced by *attr*. The *pthread_rwlockattr_setpshared*( )
55958 function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

55959 The *process-shared* attribute shall be set to PTHREAD_PROCESS_SHARED to permit a read-write
55960 lock to be operated upon by any thread that has access to the memory where the read-write lock
55961 is allocated, even if the read-write lock is allocated in memory that is shared by multiple
55962 processes. See Section 2.9.9 (on page 523) for further requirements. The default value of the
55963 *process-shared* attribute shall be PTHREAD_PROCESS_PRIVATE.

55964 Additional attributes, their default values, and the names of the associated functions to get and
55965 set those attribute values are implementation-defined.

55966 The behavior is undefined if the value specified by the *attr* argument to
55967 *pthread_rwlockattr_getpshared*( ) or *pthread_rwlockattr_setpshared*( ) does not refer to an initialized
55968 read-write lock attributes object.

55969 **RETURN VALUE**

55970 Upon successful completion, the *pthread_rwlockattr_getpshared*( ) function shall return zero and
55971 store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared*
55972 parameter. Otherwise, an error number shall be returned to indicate the error.

55973 If successful, the *pthread_rwlockattr_setpshared*( ) function shall return zero; otherwise, an error
55974 number shall be returned to indicate the error.

55975 **ERRORS**

55976 The *pthread_rwlockattr_setpshared*( ) function may fail if:

55977 [EINVAL] The new value specified for the attribute is outside the range of legal values
55978 for that attribute.

55979 These functions shall not return an error code of [EINTR].

55980 **EXAMPLES**

55981 None.

55982 **APPLICATION USAGE**

55983 None.

55984 **RATIONALE**

55985 None.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_rwlock_destroy( ), *pthread_rwlockattr_destroy*( )

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR TSH to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The DESCRIPTION notes that additional attributes are implementation-defined.
- The SEE ALSO section is updated.

The **restrict** keyword is added to the *pthread_rwlockattr_getpshared*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *pthread_rwlockattr_getpshared*( ) and *pthread_rwlockattr_setpshared*( ) functions are marked only as part of the Thread Process-Shared Synchronization option as the Threads option is now part of the Base.

The [EINVAL] error for an uninitialized read-write lock attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0292 [972] and XSH/TC2-2008/0293 [757] are applied.

56010 **NAME**

56011 pthread_rwlockattr_init — initialize the read-write lock attributes object

56012 **SYNOPSIS**

56013 ```
#include <pthread.h>
```

56014 ```
int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);
```

56015 **DESCRIPTION**

56016 Refer to *pthread_rwlockattr_destroy( )*.

NAME

pthread_rwlockattr_setpshared ‡′ set the pwocess-shared attribute of the read-write lock attributes object

SYNOPSIS

TSH

```
#include <pthread.h>

int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
    int pshared);
```

DESCRIPTION

Refer to *pthread_rwlockattr_getpshared( )*.

NAME

pthread_self — get the calling thread ID

SYNOPSIS

```
#include <pthread.h>

pthread_t pthread_self(void);
```

DESCRIPTION

The *pthread_self*( ) function shall return the thread ID of the calling thread.

RETURN VALUE

The *pthread_self*( ) function shall always be successful and no return value is reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *pthread_self*( ) function provides a capability similar to the *getpid*( ) function for processes and the rationale is the same: the creation call does not provide the thread ID to the created thread.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_create( ), *pthread_equal*( )

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_self*( ) function is marked as part of the Threads option.

Issue 7

Austin Group Interpretation 1003.1-2001 #063 is applied, updating the RETURN VALUE section.

The *pthread_self*( ) function is moved from the Threads option to the Base.

56058 **NAME**

56059 pthread_setcancelstate, pthread_setcanceltype, pthread_testcancel — set cancelability state

56060 **SYNOPSIS**

56061 ```
#include <pthread.h>

int pthread_setcancelstate(int state, int *oldstate);
int pthread_setcanceltype(int type, int *oldtype);
void pthread_testcancel(void);
```

56065 **DESCRIPTION**

56066 The *pthread_setcancelstate*( ) function shall atomically both set the calling thread's cancelability
56067 state to the indicated *state* and return the previous cancelability state at the location referenced
56068 by *oldstate*. Legal values for *state* are PTHREAD_CANCEL_ENABLE and
56069 PTHREAD_CANCEL_DISABLE.

56070 The *pthread_setcanceltype*( ) function shall atomically both set the calling thread's cancelability
56071 type to the indicated *type* and return the previous cancelability type at the location referenced by
56072 *oldtype*. Legal values for *type* are PTHREAD_CANCEL_DEFERRED and
56073 PTHREAD_CANCEL_ASYNCHRONOUS.

56074 The cancelability state and type of any newly created threads, including the thread in which
56075 *main*( ) was first invoked, shall be PTHREAD_CANCEL_ENABLE and
56076 PTHREAD_CANCEL_DEFERRED respectively.

56077 The *pthread_testcancel*( ) function shall create a cancellation point in the calling thread. The
56078 *pthread_testcancel*( ) function shall have no effect if cancelability is disabled.

56079 **RETURN VALUE**

56080 If successful, the *pthread_setcancelstate*( ) and *pthread_setcanceltype*( ) functions shall return zero;
56081 otherwise, an error number shall be returned to indicate the error.

56082 **ERRORS**

56083 The *pthread_setcancelstate*( ) function may fail if:

56084 [EINVAL] The specified state is not PTHREAD_CANCEL_ENABLE or
56085 PTHREAD_CANCEL_DISABLE.

56086 The *pthread_setcanceltype*( ) function may fail if:

56087 [EINVAL] The specified type is not PTHREAD_CANCEL_DEFERRED or
56088 PTHREAD_CANCEL_ASYNCHRONOUS.

56089 These functions shall not return an error code of [EINTR].

56090 **EXAMPLES**

56091 None.

56092 **APPLICATION USAGE**

56093 In order to write a signal handler for an asynchronous signal which can run safely in a
56094 cancellable thread, *pthread_setcancelstate*( ) must be used to disable cancellation for the duration
56095 of any calls that the signal handler makes which are cancellation points. However, the standard
56096 does not permit strictly conforming applications to call *pthread_setcancelstate*( ) from a signal
56097 handler since it is not currently required to be async-signal-safe. On implementations where
56098 *pthread_setcancelstate*( ) is not async-signal-safe, alternatives are to ensure either that the
56099 corresponding signals are blocked during execution of functions that are not async-cancel-safe
56100 or that cancellation is disabled during times when those signals could be delivered.
56101 Implementations are strongly encouraged to make *pthread_setcancelstate*( ) async-signal-safe.

  
```

RATIONALE

The *pthread_setcancelstate*( ) and *pthread_setcanceltype*( ) functions control the points at which a thread may be asynchronously canceled. For cancellation control to be usable in modular fashion, some rules need to be followed.

An object can be considered to be a generalization of a procedure. It is a set of procedures and global variables written as a unit and called by clients not known by the object. Objects may depend on other objects.

First, cancelability should only be disabled on entry to an object, never explicitly enabled. On exit from an object, the cancelability state should always be restored to its value on entry to the object.

This follows from a modularity argument: if the client of an object (or the client of an object that uses that object) has disabled cancelability, it is because the client does not want to be concerned about cleaning up if the thread is canceled while executing some sequence of actions. If an object is called in such a state and it enables cancelability and a cancellation request is pending for that thread, then the thread is canceled, contrary to the wish of the client that disabled.

Second, the cancelability type may be explicitly set to either *deferred* or *asynchronous* upon entry to an object. But as with the cancelability state, on exit from an object the cancelability type should always be restored to its value on entry to the object.

Finally, only functions that are cancel-safe may be called from a thread that is asynchronously cancelable.

FUTURE DIRECTIONS

The *pthread_setcancelstate*( ) function may be added to the table of async-signal-safe functions in Section 2.4.3 (on page 490).

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_setcancelstate*( ), *pthread_setcanceltype*( ), and *pthread_testcancel*( ) functions are marked as part of the Threads option.

Issue 7

The *pthread_setcancelstate*( ), *pthread_setcanceltype*( ), and *pthread_testcancel*( ) functions are moved from the Threads option to the Base.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0294 [622] and XSH/TC2-2008/0295 [615] are applied.

NAME

pthread_setconcurrency — set the level of concurrency

SYNOPSIS

OB XSI
```
#include <pthread.h>

int pthread_setconcurrency(int new_level);
```

DESCRIPTION

Refer to *pthread_getconcurrency( )*.

56145 **NAME**

56146 pthread_setschedparam ‡′ dynamic thread scheduling parameters access (**REALTIME**
56147 **THREADS**)

56148 **SYNOPSIS**

56149 TPS
```
#include <pthread.h>

int pthread_setschedparam(pthread_t thread, int policy,
    const struct sched_param *param);
```

56152 **DESCRIPTION**

56153 Refer to *pthread_getschedparam( )*.

NAME

pthread_setschedprio — dynamic thread scheduling parameters access (**REALTIME THREADS**)

SYNOPSIS

TPS

```
#include <pthread.h>

int pthread_setschedprio(pthread_t thread, int prio);
```

DESCRIPTION

The *pthread_setschedprio*( ) function shall set the scheduling priority for the thread whose thread ID is given by *thread* to the value given by *prio*. See Scheduling Policies (on page 506) for a description on how this function call affects the ordering of the thread in the thread list for its new priority.

If the *pthread_setschedprio*( ) function fails, the scheduling priority of the target thread shall not be changed.

RETURN VALUE

If successful, the *pthread_setschedprio*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_setschedprio*( ) function may fail if:

[EINVAL] The value of *prio* is invalid for the scheduling policy of the specified thread.

[EPERM] The caller does not have appropriate privileges to set the scheduling priority of the specified thread.

The *pthread_setschedprio*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *pthread_setschedprio*( ) function provides a way for an application to temporarily raise its priority and then lower it again, without having the undesired side-effect of yielding to other threads of the same priority. This is necessary if the application is to implement its own strategies for bounding priority inversion, such as priority inheritance or priority ceilings. This capability is especially important if the implementation does not support the Thread Priority Protection or Thread Priority Inheritance options, but even if those options are supported it is needed if the application is to bound priority inheritance for other resources, such as semaphores.

The standard developers considered that while it might be preferable conceptually to solve this problem by modifying the specification of *pthread_setschedparam*( ), it was too late to make such a change, as there may be implementations that would need to be changed. Therefore, this new function was introduced.

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended that the function should fail and report an [ESRCH] error.

FUTURE DIRECTIONS

None.

SEE ALSO

Scheduling Policies (on page 506), *pthread_getschedparam( )*

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 6. Included as a response to IEEE PASC Interpretation 1003.1 #96.

Issue 7

The *pthread_setschedprio*( ) function is marked only as part of the Thread Execution Scheduling option as the Threads option is now part of the Base.

Austin Group Interpretation 1003.1-2001 #069 is applied, updating the [EPERM] error.

Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0466 [314] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0296 [757] is applied.

NAME

pthread_setspecific — thread-specific data management

SYNOPSIS

```
#include <pthread.h>

int pthread_setspecific(pthread_key_t key, const void *value);
```

DESCRIPTION

Refer to *pthread_getspecific( )*.

NAME

pthread_sigmask, sigprocmask — examine and change blocked signals

SYNOPSIS

CX
```
#include <signal.h>

int pthread_sigmask(int how, const sigset_t *restrict set,
    sigset_t *restrict oset);
int sigprocmask(int how, const sigset_t *restrict set,
    sigset_t *restrict oset);
```

DESCRIPTION

The *pthread_sigmask*( ) function shall examine or change (or both) the calling thread's signal mask, regardless of the number of threads in the process. The function shall be equivalent to *sigprocmask*( ), without the restriction that the call be made in a single-threaded process.

In a single-threaded process, the *sigprocmask*( ) function shall examine or change (or both) the signal mask of the calling thread.

If the argument *set* is not a null pointer, it points to a set of signals to be used to change the currently blocked set.

The argument *how* indicates the way in which the set is changed, and the application shall ensure it consists of one of the following values:

SIG_BLOCK The resulting set shall be the union of the current set and the signal set pointed to by *set*.

SIG_SETMASK The resulting set shall be the signal set pointed to by *set*.

SIG_UNBLOCK The resulting set shall be the intersection of the current set and the complement of the signal set pointed to by *set*.

If the argument *oset* is not a null pointer, the previous mask shall be stored in the location pointed to by *oset*. If *set* is a null pointer, the value of the argument *how* is not significant and the thread's signal mask shall be unchanged; thus the call can be used to enquire about currently blocked signals.

If there are any pending unblocked signals after the call to *sigprocmask*( ), at least one of those signals shall be delivered before the call to *sigprocmask*( ) returns.

It is not possible to block those signals which cannot be ignored. This shall be enforced by the system without causing an error to be indicated.

If any of the SIGFPE, SIGILL, SIGSEGV, or SIGBUS signals are generated while they are blocked, the result is undefined, unless the signal was generated by the action of another process, or by one of the functions *kill*( ), *pthread_kill*( ), *raise*( ), or *sigqueue*( ).

If *sigprocmask*( ) fails, the thread's signal mask shall not be changed.

The use of the *sigprocmask*( ) function is unspecified in a multi-threaded process.

RETURN VALUE

Upon successful completion *pthread_sigmask*( ) shall return 0; otherwise, it shall return the corresponding error number.

Upon successful completion, *sigprocmask*( ) shall return 0; otherwise, −1 shall be returned, *errno* shall be set to indicate the error, and the signal mask of the process shall be unchanged.

ERRORS

The *pthread_sigmask*( ) and *sigprocmask*( ) functions shall fail if:

[EINVAL] The value of the *how* argument is not equal to one of the defined values.

The *pthread_sigmask*( ) function shall not return an error code of [EINTR].

EXAMPLES

Signaling in a Multi-Threaded Process

This example shows the use of *pthread_sigmask*( ) in order to deal with signals in a multi-threaded process. It provides a fairly general framework that could be easily adapted/extended.

```
#include <stdio.h>
#include <stdlib.h>
#include <pthread.h>
#include <signal.h>
#include <string.h>
#include <errno.h>
...

static sigset_t   signal_mask;  /* signals to block         */

int main (int argc, char *argv[])
{
    pthread_t  sig_thr_id;      /* signal handler thread ID */
    int        rc;              /* return code              */

    sigemptyset (&signal_mask);
    sigaddset (&signal_mask, SIGINT);
    sigaddset (&signal_mask, SIGTERM);
    rc = pthread_sigmask (SIG_BLOCK, &signal_mask, NULL);
    if (rc != 0) {
        /* handle error */
        ...
    }
    /* any newly created threads inherit the signal mask */

    rc = pthread_create (&sig_thr_id, NULL, signal_thread, NULL);
    if (rc != 0) {
        /* handle error */
        ...
    }

    /* APPLICATION CODE */
    ...
}

void *signal_thread (void *arg)
{
    int       sig_caught;    /* signal caught       */
    int       rc;            /* returned code       */

    rc = sigwait (&signal_mask, &sig_caught);
    if (rc != 0) {
        /* handle error */
    }
```

```
            switch (sig_caught)
            {
            case SIGINT:     /* process SIGINT  */
                ...
                break;
            case SIGTERM:    /* process SIGTERM */
                ...
                break;
            default:         /* should normally not happen */
                fprintf (stderr, "\nUnexpected signal %d\n", sig_caught);
                break;
            }
        }
```

APPLICATION USAGE

None.

RATIONALE

When a thread's signal mask is changed in a signal-catching function that is installed by *sigaction*( ), the restoration of the signal mask on return from the signal-catching function overrides that change (see *sigaction*( )). If the signal-catching function was installed with *signal*( ), it is unspecified whether this occurs.

See *kill*( ) for a discussion of the requirement on delivery of signals.

FUTURE DIRECTIONS

None.

SEE ALSO

exec, *kill*( ), *sigaction*( ), *sigaddset*( ), *sigdelset*( ), *sigemptyset*( ), *sigfillset*( ), *sigismember*( ), *sigpending*( ), *sigqueue*( ), *sigsuspend*( )

XBD **<signal.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

The *pthread_sigmask*( ) function is added for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_sigmask*( ) function is marked as part of the Threads option.

The SYNOPSIS for *sigprocmask*( ) is marked as a CX extension to note that the presence of this function in the **<signal.h>** header is an extension to the ISO C standard.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

> The DESCRIPTION is updated to explicitly state the functions which may generate the signal.

The normative text is updated to avoid use of the term ``must'' for application requirements.

The **restrict** keyword is added to the *pthread_sigmask*( ) and *sigprocmask*( ) prototypes for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/105 is applied, updating ``process' signal mask'' to ``thread's signal mask'' in the DESCRIPTION and RATIONALE sections.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/106 is applied, adding the example to the EXAMPLES section.

Issue 7

The *pthread_sigmask*( ) function is moved from the Threads option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0467 [319] is applied.

NAME

pthread_spin_destroy, pthread_spin_init — destroy or initialize a spin lock object

SYNOPSIS

```
#include <pthread.h>

int pthread_spin_destroy(pthread_spinlock_t *lock);
int pthread_spin_init(pthread_spinlock_t *lock, int pshared);
```

DESCRIPTION

The *pthread_spin_destroy*( ) function shall destroy the spin lock referenced by *lock* and release any resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is reinitialized by another call to *pthread_spin_init*( ). The results are undefined if *pthread_spin_destroy*( ) is called when a thread holds the lock, or if this function is called with an uninitialized thread spin lock.

The *pthread_spin_init*( ) function shall allocate any resources required to use the spin lock referenced by *lock* and initialize the lock to an unlocked state.

TSH If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is PTHREAD_PROCESS_SHARED, the implementation shall permit the spin lock to be operated upon by any thread that has access to the memory where the spin lock is allocated, even if it is allocated in memory that is shared by multiple processes.

See Section 2.9.9 (on page 523) for further requirements.

The results are undefined if *pthread_spin_init*( ) is called specifying an already initialized spin lock. The results are undefined if a spin lock is used without first being initialized.

If the *pthread_spin_init*( ) function fails, the lock is not initialized and the contents of *lock* are undefined.

Only the object referenced by *lock* may be used for performing synchronization.

The result of referring to copies of that object in calls to *pthread_spin_destroy*( ), *pthread_spin_lock*( ), *pthread_spin_trylock*( ), or *pthread_spin_unlock*( ) is undefined.

RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_spin_init*( ) function shall fail if:

[EAGAIN] The system lacks the necessary resources to initialize another spin lock.

[ENOMEM] Insufficient memory exists to initialize the lock.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *lock* argument to *pthread_spin_destroy*( ) does not refer to an initialized spin lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *lock* argument to

pthread_spin_destroy( ) or *pthread_spin_init*( ) refers to a locked spin lock object, or detects that the value specified by the *lock* argument to *pthread_spin_init*( ) refers to an already initialized spin lock object, it is recommended that the function should fail and report an [EBUSY] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_spin_lock( ), *pthread_spin_unlock*( )

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

Issue 7

The *pthread_spin_destroy*( ) and *pthread_spin_init*( ) functions are moved from the Spin Locks option to the Base.

The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in undefined behavior.

The [EBUSY] error for a locked spin lock object or an already initialized spin lock object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0297 [972] is applied.

NAME

pthread_spin_lock, pthread_spin_trylock — lock a spin lock object

SYNOPSIS

```
#include <pthread.h>

int pthread_spin_lock(pthread_spinlock_t *lock);
int pthread_spin_trylock(pthread_spinlock_t *lock);
```

DESCRIPTION

The *pthread_spin_lock*( ) function shall lock the spin lock referenced by *lock*. The calling thread shall acquire the lock if it is not held by another thread. Otherwise, the thread shall spin (that is, shall not return from the *pthread_spin_lock*( ) call) until the lock becomes available. The results are undefined if the calling thread holds the lock at the time the call is made. The *pthread_spin_trylock*( ) function shall lock the spin lock referenced by *lock* if it is not held by any thread. Otherwise, the function shall fail.

The results are undefined if any of these functions is called with an uninitialized spin lock.

RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_spin_lock*( ) function may fail if:

[EDEADLK] A deadlock condition was detected.

The *pthread_spin_trylock*( ) function shall fail if:

[EBUSY] A thread currently holds the lock.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using this function may be subject to priority inversion, as discussed in XBD Section 3.291 (on page 80).

RATIONALE

If an implementation detects that the value specified by the *lock* argument to *pthread_spin_lock*( ) or *pthread_spin_trylock*( ) does not refer to an initialized spin lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *lock* argument to *pthread_spin_lock*( ) refers to a spin lock object for which the calling thread already holds the lock, it is recommended that the function should fail and report an [EDEADLK] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_spin_destroy( ), *pthread_spin_unlock*( )

XBD Section 3.291 (on page 80), Section 4.12 (on page 111), **<pthread.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/107 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_spin_lock*( ) and *pthread_spin_trylock*( ) functions are moved from the Spin Locks option to the Base.

The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in undefined behavior.

The [EDEADLK] error for a spin lock object for which the calling thread already holds the lock is removed; this condition results in undefined behavior.

NAME

pthread_spin_unlock — unlock a spin lock object

SYNOPSIS

```
#include <pthread.h>

int pthread_spin_unlock(pthread_spinlock_t *lock);
```

DESCRIPTION

The *pthread_spin_unlock*( ) function shall release the spin lock referenced by *lock* which was locked via the *pthread_spin_lock*( ) or *pthread_spin_trylock*( ) functions.

The results are undefined if the lock is not held by the calling thread.

If there are threads spinning on the lock when *pthread_spin_unlock*( ) is called, the lock becomes available and an unspecified spinning thread shall acquire the lock.

The results are undefined if this function is called with an uninitialized thread spin lock.

RETURN VALUE

Upon successful completion, the *pthread_spin_unlock*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *lock* argument to *pthread_spin_unlock*( ) does not refer to an initialized spin lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *lock* argument to *pthread_spin_unlock*( ) refers to a spin lock object for which the current thread does not hold the lock, it is recommended that the function should fail and report an [EPERM] error.

FUTURE DIRECTIONS

None.

56506 removed; this condition results in undefined behavior.

NAME

pthread_testcancel — set cancelability state

SYNOPSIS

```
#include <pthread.h>

void pthread_testcancel(void);
```

DESCRIPTION

Refer to *pthread_setcancelstate( )*.

NAME

ptsname ‡'get name of the slave pseudo-terminal device

SYNOPSIS

XSI
```
#include <stdlib.h>

char *ptsname(int fildes);
```

DESCRIPTION

The *ptsname*( ) function shall return the name of the slave pseudo-terminal device associated with a master pseudo-terminal device. The *fildes* argument is a file descriptor that refers to the master device. The *ptsname*( ) function shall return a pointer to a string containing the pathname of the corresponding slave device.

The *ptsname*( ) function need not be thread-safe.

RETURN VALUE

Upon successful completion, *ptsname*( ) shall return a pointer to a string which is the name of the pseudo-terminal slave device. Upon failure, *ptsname*( ) shall return a null pointer and may set *errno*. This could occur if *fildes* is an invalid file descriptor or if the slave device name does not exist in the file system.

The application shall not modify the string returned. The returned pointer might be invalidated or the string content might be overwritten by a subsequent call to *ptsname*( ). The returned pointer and the string content might also be invalidated if the calling thread is terminated.

ERRORS

The *ptsname*( ) function may fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[ENOTTY] The file associated with the *fildes* argument is not a master pseudo-terminal device.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

See the RATIONALE section for *posix_openpt*( ).

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0468 [75] and XSH/TC1-2008/0469 [96] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0298 [503], XSH/TC2-2008/0299 [656], and XSH/TC2-2008/0300 [503] are applied.

NAME

putc — put a byte on a stream

SYNOPSIS

```
#include <stdio.h>

int putc(int c, FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *putc*( ) function shall be equivalent to *fputc*( ), except that if it is implemented as a macro it may evaluate *stream* more than once, so the argument should never be an expression with side-effects.

RETURN VALUE

Refer to *fputc*( ).

ERRORS

Refer to *fputc*( ).

EXAMPLES

None.

APPLICATION USAGE

Since it may be implemented as a macro, *putc*( ) may treat a *stream* argument with side-effects incorrectly. In particular, *putc*(*c*,*f*++) does not necessarily work correctly. Therefore, use of this function is not recommended in such situations; *fputc*( ) should be used instead.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

putchar_unlocked ‡'stdio with explicit client locking

SYNOPSIS

CX
```
#include <stdio.h>

int putchar_unlocked(int c);
```

DESCRIPTION

Refer to *getc_unlocked( )*.

NAME

putenv — change or add a value to an environment

SYNOPSIS

XSI
```
#include <stdlib.h>

int putenv(char *string);
```

DESCRIPTION

The *putenv*( ) function shall use the *string* argument to set environment variable values. The *string* argument should point to a string of the form "*name=value*". The *putenv*( ) function shall make the value of the environment variable *name* equal to *value* by altering an existing variable or creating a new one. In either case, the string pointed to by *string* shall become part of the environment, so altering the string shall change the environment.

The *putenv*( ) function need not be thread-safe.

RETURN VALUE

Upon successful completion, *putenv*( ) shall return 0; otherwise, it shall return a non-zero value and set *errno* to indicate the error.

ERRORS

The *putenv*( ) function may fail if:

[ENOMEM] Insufficient memory was available.

EXAMPLES

Changing the Value of an Environment Variable

The following example changes the value of the *HOME* environment variable to the value **/usr/home**.

```
#include <stdlib.h>
...
static char *var = "HOME=/usr/home";
int ret;

ret = putenv(var);
```

APPLICATION USAGE

The *putenv*( ) function manipulates the environment pointed to by *environ*, and can be used in conjunction with *getenv*( ).

See *exec*( ) for restrictions on changing the environment in multi-threaded applications.

This routine may use *malloc*( ) to enlarge the environment.

A potential error is to call *putenv*( ) with an automatic variable as the argument, then return from the calling function while *string* is still part of the environment.

Although the space used by *string* is no longer used once a new string which defines *name* is passed to *putenv*( ), if any thread in the application has used *getenv*( ) to retrieve a pointer to this variable, it should not be freed by calling *free*( ). If the changed environment variable is one known by the system (such as the locale environment variables) the application should never free the buffer used by earlier calls to *putenv*( ) for the same variable.

The *setenv*( ) function is preferred over this function. One reason is that *putenv*( ) is optional and therefore less portable. Another is that using *putenv*( ) can slow down environment searches, as explained in the RATIONALE section for *getenv*( ).

RATIONALE

Refer to the RATIONALE section in *setenv( )*.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The type of the argument to this function is changed from **const char** * to **char** *. This was indicated as a FUTURE DIRECTION in previous issues.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/48 is applied, clarifying wording in the DESCRIPTION and adding a new paragraph into APPLICATION USAGE referring readers to *exec*.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0472 [167], XSH/TC1-2008/0473 [167], XSH/TC1-2008/0474 [273,438], and XSH/TC1-2008/0475 [273] are applied.

NAME

putmsg, putpmsg ‡'send a message on a STREAM**$TREAMS**)

SYNOPSIS

OB XSR

```
#include <stropts.h>

int putmsg(int fildes, const struct strbuf *ctlptr,
    const struct strbuf *dataptr, int flags);
int putpmsg(int fildes, const struct strbuf *ctlptr,
    const struct strbuf *dataptr, int band, int flags);
```

DESCRIPTION

The *putmsg*( ) function shall create a message from a process buffer(s) and send the message to a STREAMS file. The message may contain either a data part, a control part, or both. The data and control parts are distinguished by placement in separate buffers, as described below. The semantics of each part are defined by the STREAMS module that receives the message.

The *putpmsg*( ) function is equivalent to *putmsg*( ), except that the process can send messages in different priority bands. Except where noted, all requirements on *putmsg*( ) also pertain to *putpmsg*( ).

The *fildes* argument specifies a file descriptor referencing an open STREAM. The *ctlptr* and *dataptr* arguments each point to a **strbuf** structure.

The *ctlptr* argument points to the structure describing the control part, if any, to be included in the message. The *buf* member in the **strbuf** structure points to the buffer where the control information resides, and the *len* member indicates the number of bytes to be sent. The *maxlen* member is not used by *putmsg*( ). In a similar manner, the argument *dataptr* specifies the data, if any, to be included in the message. The *flags* argument indicates what type of message should be sent and is described further below.

To send the data part of a message, the application shall ensure that *dataptr* is not a null pointer and the *len* member of *dataptr* is 0 or greater. To send the control part of a message, the application shall ensure that the corresponding values are set for *ctlptr*. No data (control) part shall be sent if either *dataptr*(*ctlptr*) is a null pointer or the *len* member of *dataptr*(*ctlptr*) is set to −1.

For *putmsg*( ), if a control part is specified and *flags* is set to RS_HIPRI, a high priority message shall be sent. If no control part is specified, and *flags* is set to RS_HIPRI, *putmsg*( ) shall fail and set *errno* to [EINVAL]. If *flags* is set to 0, a normal message (priority band equal to 0) shall be sent. If a control part and data part are not specified and *flags* is set to 0, no message shall be sent and 0 shall be returned.

For *putpmsg*( ), the flags are different. The *flags* argument is a bitmask with the following mutually-exclusive flags defined: MSG_HIPRI and MSG_BAND. If *flags* is set to 0, *putpmsg*( ) shall fail and set *errno* to [EINVAL]. If a control part is specified and *flags* is set to MSG_HIPRI and *band* is set to 0, a high-priority message shall be sent. If *flags* is set to MSG_HIPRI and either no control part is specified or *band* is set to a non-zero value, *putpmsg*( ) shall fail and set *errno* to [EINVAL]. If *flags* is set to MSG_BAND, then a message shall be sent in the priority band specified by *band*. If a control part and data part are not specified and *flags* is set to MSG_BAND, no message shall be sent and 0 shall be returned.

The *putmsg*( ) function shall block if the STREAM write queue is full due to internal flow control conditions, with the following exceptions:

For high-priority messages, *putmsg*( ) shall not block on this condition and continues processing the message.

For other messages, *putmsg*( ) shall not block but shall fail when the write queue is full and O_NONBLOCK is set.

The *putmsg*( ) function shall also block, unless prevented by lack of internal resources, while waiting for the availability of message blocks in the STREAM, regardless of priority or whether O_NONBLOCK has been specified. No partial message shall be sent.

RETURN VALUE

Upon successful completion, *putmsg*( ) and *putpmsg*( ) shall return 0; otherwise, they shall return −1 and set *errno* to indicate the error.

ERRORS

The *putmsg*( ) and *putpmsg*( ) functions shall fail if:

[EAGAIN] A non-priority message was specified, the O_NONBLOCK flag is set, and the STREAM write queue is full due to internal flow control conditions; or buffers could not be allocated for the message that was to be created.

[EBADF] *fildes* is not a valid file descriptor open for writing.

[EINTR] A signal was caught during *putmsg*( ).

[EINVAL] An undefined value is specified in *flags*, or *flags* is set to RS_HIPRI or MSG_HIPRI and no control part is supplied, or the STREAM or multiplexer referenced by *fildes* is linked (directly or indirectly) downstream from a multiplexer, or *flags* is set to MSG_HIPRI and *band* is non-zero (for *putpmsg*( ) only).

[ENOSR] Buffers could not be allocated for the message that was to be created due to insufficient STREAMS memory resources.

[ENOSTR] A STREAM is not associated with *fildes*.

[ENXIO] A hangup condition was generated downstream for the specified STREAM.

[EPIPE] or [EIO] The *fildes* argument refers to a STREAMS-based pipe and the other end of the pipe is closed. A SIGPIPE signal is generated for the calling thread.

[ERANGE] The size of the data part of the message does not fall within the range specified by the maximum and minimum packet sizes of the topmost STREAM module. This value is also returned if the control part of the message is larger than the maximum configured size of the control part of a message, or if the data part of a message is larger than the maximum configured size of the data part of a message.

In addition, *putmsg*( ) and *putpmsg*( ) shall fail if the STREAM head had processed an asynchronous error before the call. In this case, the value of *errno* does not reflect the result of *putmsg*( ) or *putpmsg*( ), but reflects the prior error.

EXAMPLES

Sending a High-Priority Message

The value of *fd* is assumed to refer to an open STREAMS file. This call to *putmsg*( ) does the following:

1. Creates a high-priority message with a control part and a data part, using the buffers pointed to by *ctrlbuf* and *databuf* , respectively.
2. Sends the message to the STREAMS file identified by *fd*.

```
#include <stropts.h>
#include <string.h>
...
int fd;
char *ctrlbuf = "This is the control part";
char *databuf = "This is the data part";
struct strbuf ctrl;
struct strbuf data;
int ret;

ctrl.buf = ctrlbuf;
ctrl.len = strlen(ctrlbuf);

data.buf = databuf;
data.len = strlen(databuf);

ret = putmsg(fd, &ctrl, &data, MSG_HIPRI);
```

Using putpmsg( )

This example has the same effect as the previous example. In this example, however, the *putpmsg*( ) function creates and sends the message to the STREAMS file.

```
#include <stropts.h>
#include <string.h>
...
int fd;
char *ctrlbuf = "This is the control part";
char *databuf = "This is the data part";
struct strbuf ctrl;
struct strbuf data;
int ret;

ctrl.buf = ctrlbuf;
ctrl.len = strlen(ctrlbuf);

data.buf = databuf;
data.len = strlen(databuf);

ret = putpmsg(fd, &ctrl, &data, 0, MSG_HIPRI);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *putmsg*( ) and *putpmsg*( ) functions may be removed in a future version.

SEE ALSO

Section 2.6 (on page 500), *getmsg*( ), *poll*( ), *read*( ), *write*( )

XBD **<stropts.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The following text is removed from the DESCRIPTION: ``The STREAM head guarantees that the control part of a message generated by *putmsg*( ) is at least 64 bytes in length''.

Issue 6

This function is marked as part of the XSI STREAMS Option Group.

The normative text is updated to avoid use of the term ``must'' for application requirements.

Issue 7

The *putmsg*( ) and *putpmsg*( ) functions are marked obsolescent.

NAME

puts ‡’put a string on standard output

SYNOPSIS

```
#include <stdio.h>

int puts(const char *s);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *puts*( ) function shall write the string pointed to by *s*, followed by a <newline>, to the standard output stream *stdout*. The terminating null byte shall not be written.

CX The last data modification and last file status change timestamps of the file shall be marked for update between the successful execution of *puts*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream or a call to *exit*( ) or *abort*( ).

RETURN VALUE

Upon successful completion, *puts*( ) shall return a non-negative number. Otherwise, it shall return EOF, shall set an error indicator for the stream, CX and *errno* shall be set to indicate the error.

ERRORS

Refer to *fputc*( ).

EXAMPLES

Printing to Standard Output

The following example gets the current time, converts it to a string using *localtime*( ) and *asctime*( ), and prints it to standard output using *puts*( ). It then prints the number of minutes to an event for which it is waiting.

```
#include <time.h>
#include <stdio.h>
...
time_t now;
int minutes_to_event;
...
time(&now);
printf("The time is ");
puts(asctime(localtime(&now)));
printf("There are %d minutes to the event.\n",
    minutes_to_event);
...
```

APPLICATION USAGE

The *puts*( ) function appends a <newline>, while *fputs*( ) does not.

This volume of POSIX.1-2017 requires that successful completion simply return a non-negative integer. There are at least three known different implementation conventions for this requirement:

Return a constant value.

Return the last character written.

Return the number of bytes written. Note that this implementation convention cannot be adhered to for strings longer than {INT_MAX} bytes as the value would not be representable in the return type of the function. For backwards compatibility, implementations can return the number of bytes for strings of up to {INT_MAX} bytes, and return {INT_MAX} for all longer strings.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Section 2.5 (on page 495), *fopen( )*, *fputs( )*, *putc( )*

XBD **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

Issue 7

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0476 [174,412] and XSH/TC1-2008/0477 [14] are applied.

NAME

pututxline ‡'put an entry into the user accounting database

SYNOPSIS

XSI
```
#include <utmpx.h>

struct utmpx *pututxline(const struct utmpx *utmpx);
```

DESCRIPTION

Refer to *endutxent( )*.

NAME

putwc — put a wide character on a stream

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

wint_t putwc(wchar_t wc, FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *putwc*( ) function shall be equivalent to *fputwc*( ), except that if it is implemented as a macro it may evaluate *stream* more than once, so the argument should never be an expression with side-effects.

RETURN VALUE

Refer to *fputwc*( ).

ERRORS

Refer to *fputwc*( ).

EXAMPLES

None.

APPLICATION USAGE

Since it may be implemented as a macro, *putwc*( ) may treat a *stream* argument with side-effects incorrectly. In particular, *putwc*(*wc*,*f*++) need not work correctly. Therefore, use of this function is not recommended; *fputwc*( ) should be used instead.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Aligned with ISO/IEC 9899: 1990/Amendment 1: 1995 (E). Specifically, the type of argument *wc* is changed from **wint_t** to **wchar_t**.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0479 [14] is applied.

56978 **NAME**

56979 pwrite ‡′write on a file

56980 **SYNOPSIS**

56981 `#include <unistd.h>`

56982 `ssize_t pwrite(int` *`fildes`*`, const void *`*`buf`*`, size_t` *`nbyte`*`,`

56983 `off_t` *`offset`*`);`

56984 **DESCRIPTION**

56985 Refer to *write( )*.

NAME

qsort ‡'sort a table of data

SYNOPSIS

```
#include <stdlib.h>

void qsort(void *base, size_t nel, size_t width,
    int (*compar)(const void *, const void *));
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *qsort*( ) function shall sort an array of *nel* objects, the initial element of which is pointed to by *base*. The size of each object, in bytes, is specified by the *width* argument. If the *nel* argument has the value zero, the comparison function pointed to by *compar* shall not be called and no rearrangement shall take place.

The application shall ensure that the comparison function pointed to by *compar* does not alter the contents of the array. The implementation may reorder elements of the array between calls to the comparison function, but shall not alter the contents of any individual element.

When the same objects (consisting of width bytes, irrespective of their current positions in the array) are passed more than once to the comparison function, the results shall be consistent with one another. That is, they shall define a total ordering on the array.

The contents of the array shall be sorted in ascending order according to a comparison function. The *compar* argument is a pointer to the comparison function, which is called with two arguments that point to the elements being compared. The application shall ensure that the function returns an integer less than, equal to, or greater than 0, if the first argument is considered respectively less than, equal to, or greater than the second. If two members compare as equal, their order in the sorted array is unspecified.

RETURN VALUE

The *qsort*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

RATIONALE

The requirement that each argument (hereafter referred to as *p)* to the comparison function is a pointer to elements of the array implies that for every call, for each argument separately, all of the following expressions are non-zero:

```
((char *)p - (char *)base) % width == 0
(char *)p >= (char *)base
(char *)p < (char *)base + nel * width
```

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/49 is applied, adding the last sentence to the first non-shaded paragraph in the DESCRIPTION, and the following two paragraphs. The RATIONALE is also updated. These changes are for alignment with the ISO C standard.

57040 **NAME**

57041 raise — send a signal to the executing process

57042 **SYNOPSIS**

57043 `#include <signal.h>`

57044 `int raise(int sig);`

57045 **DESCRIPTION**

57046 CX The functionality described on this reference page is aligned with the ISO C standard. Any
57047 conflict between the requirements described here and the ISO C standard is unintentional. This
57048 volume of POSIX.1-2017 defers to the ISO C standard.

57049 CX The *raise*( ) function shall send the signal *sig* to the executing thread or process. If a signal
57050 handler is called, the *raise*( ) function shall not return until after the signal handler does.

57051 CX The effect of the *raise*( ) function shall be equivalent to calling:

57052 `pthread_kill(pthread_self(), sig);`

57053 **RETURN VALUE**

57054 CX Upon successful completion, 0 shall be returned. Otherwise, a non-zero value shall be returned
57055 and *errno* shall be set to indicate the error.

57056 **ERRORS**

57057 The *raise*( ) function shall fail if:

57058 CX [EINVAL] The value of the *sig* argument is an invalid signal number.

57059 **EXAMPLES**

57060 None.

57061 **APPLICATION USAGE**

57062 None.

57063 **RATIONALE**

57064 The term ``thread'' is an extension to the ISO C standard.

57065 **FUTURE DIRECTIONS**

57066 None.

57067 **SEE ALSO**

57068 *kill*( ), *sigaction*( )

57069 XBD **<signal.h>**, **<sys/types.h>**

57070 **CHANGE HISTORY**

57071 First released in Issue 4. Derived from the ANSI C standard.

57072 **Issue 5**

57073 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

57074 **Issue 6**

57075 Extensions beyond the ISO C standard are marked.

57076 The following new requirements on POSIX implementations derive from alignment with the
57077 Single UNIX Specification:

57078 In the RETURN VALUE section, the requirement to set *errno* on error is added.

The [EINVAL] error condition is added.

Issue 7

Functionality relating to the Threads option is moved to the Base.

NAME

rand, rand_r, srand ‡'pseudo-random number generator

SYNOPSIS

```
#include <stdlib.h>

int rand(void);
int rand_r(unsigned *seed);
void srand(unsigned seed);
```

DESCRIPTION

CX For *rand*( ) and *srand*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *rand*( ) function shall compute a sequence of pseudo-random integers in the range XSI [0,{RAND_MAX}] with a period of at least 2^{32}.

CX The *rand*( ) function need not be thread-safe.

OB CX The *rand_r*( ) function shall compute a sequence of pseudo-random integers in the range [0,{RAND_MAX}]. (The value of the {RAND_MAX} macro shall be at least 32 767.)

If *rand_r*( ) is called with the same initial value for the object pointed to by *seed* and that object is not modified between successive returns and calls to *rand_r*( ), the same sequence shall be generated.

The *srand*( ) function uses the argument as a seed for a new sequence of pseudo-random numbers to be returned by subsequent calls to *rand*( ). If *srand*( ) is then called with the same seed value, the sequence of pseudo-random numbers shall be repeated. If *rand*( ) is called before any calls to *srand*( ) are made, the same sequence shall be generated as when *srand*( ) is first called with a seed value of 1.

The implementation shall behave as if no function defined in this volume of POSIX.1-2017 calls *rand*( ) or *srand*( ).

RETURN VALUE

The *rand*( ) function shall return the next pseudo-random number in the sequence.

OB CX The *rand_r*( ) function shall return a pseudo-random integer.

The *srand*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

Generating a Pseudo-Random Number Sequence

The following example demonstrates how to generate a sequence of pseudo-random numbers.

```
#include <stdio.h>
#include <stdlib.h>
...
    long count, i;
    char *keystr;
    int elementlen, len;
    char c;
...
```

```
    /* Initial random number generator. */
        srand(1);

        /* Create keys using only lowercase characters */
        len = 0;
        for (i=0; i<count; i++) {
            while (len < elementlen) {
                c = (char) (rand() % 128);
                if (islower(c))
                    keystr[len++] = c;
            }

            keystr[len] = '\0';
            printf("%s Element%0*ld\n", keystr, elementlen, i);
            len = 0;
        }
```

Generating the Same Sequence on Different Machines

The following code defines a pair of functions that could be incorporated into applications wishing to ensure that the same sequence of numbers is generated across different machines.

```
static unsigned long next = 1;
int myrand(void)  /* RAND_MAX assumed to be 32767. */
{
    next = next * 1103515245 + 12345;
    return((unsigned)(next/65536) % 32768);
}

void mysrand(unsigned seed)
{
    next = seed;
}
```

APPLICATION USAGE

The *drand48*( ) and *random*( ) functions provide much more elaborate pseudo-random number generators.

The limitations on the amount of state that can be carried between one function call and another mean the *rand_r*( ) function can never be implemented in a way which satisfies all of the requirements on a pseudo-random number generator.

These functions should be avoided whenever non-trivial requirements (including safety) have to be fulfilled.

RATIONALE

The ISO C standard *rand*( ) and *srand*( ) functions allow per-process pseudo-random streams shared by all threads. Those two functions need not change, but there has to be mutual-exclusion that prevents interference between two threads concurrently accessing the random number generator.

With regard to *rand*( ), there are two different behaviors that may be wanted in a multi-threaded program:

1. A single per-process sequence of pseudo-random numbers that is shared by all threads that call *rand*( )

2. A different sequence of pseudo-random numbers for each thread that calls *rand*( )

This is provided by the modified thread-safe function based on whether the seed value is global to the entire process or local to each thread.

This does not address the known deficiencies of the *rand*( ) function implementations, which have been approached by maintaining more state. In effect, this specifies new thread-safe forms of a deficient function.

FUTURE DIRECTIONS

The *rand_r*( ) function may be removed in a future version.

XBD **<stdlib.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The *rand_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *rand*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

Extensions beyond the ISO C standard are marked.

The *rand_r*( ) function is marked as part of the Thread-Safe Functions option.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

The *rand_r*( ) function is marked obsolescent.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0301 [743] is applied.

57192 **NAME**

57193 random ‡'generate pseudo-random number

57194 **SYNOPSIS**

57195 XSI
```
#include <stdlib.h>

long random(void);
```

57197 **DESCRIPTION**

57198 Refer to *initstate( )*.

57199 **NAME**

57200 pread, read — read from a file

57201 **SYNOPSIS**

57202 ```
#include <unistd.h>
```

57203 ```
ssize_t pread(int fildes, void *buf, size_t nbyte, off_t offset);
```

57204 ```
ssize_t read(int fildes, void *buf, size_t nbyte);
```

57205 **DESCRIPTION**

57206 The *read*( ) function shall attempt to read *nbyte* bytes from the file associated with the open file
57207 descriptor, *fildes*, into the buffer pointed to by *buf*. The behavior of multiple concurrent reads on
57208 the same pipe, FIFO, or terminal device is unspecified.

57209 Before any action described below is taken, and if *nbyte* is zero, the *read*( ) function may detect
57210 and return errors as described below. In the absence of errors, or if error detection is not
57211 performed, the *read*( ) function shall return zero and have no other results.

57212 On files that support seeking (for example, a regular file), the *read*( ) shall start at a position in
57213 the file given by the file offset associated with *fildes*. The file offset shall be incremented by the
57214 number of bytes actually read.

57215 Files that do not support seeking—for example, terminals—always read from the current
57216 position. The value of a file offset associated with such a file is undefined.

57217 No data transfer shall occur past the current end-of-file. If the starting position is at or after the
57218 end-of-file, 0 shall be returned. If the file refers to a device special file, the result of subsequent
57219 *read*( ) requests is implementation-defined.

57220 If the value of *nbyte* is greater than {SSIZE_MAX}, the result is implementation-defined.

57221 When attempting to read from an empty pipe or FIFO:

57222 If no process has the pipe open for writing, *read*( ) shall return 0 to indicate end-of-file.

57223 If some process has the pipe open for writing and O_NONBLOCK is set, *read*( ) shall return
57224 −1 and set *errno* to [EAGAIN].

57225 If some process has the pipe open for writing and O_NONBLOCK is clear, *read*( ) shall
57226 block the calling thread until some data is written or the pipe is closed by all processes that
57227 had the pipe open for writing.

57228 When attempting to read a file (other than a pipe or FIFO) that supports non-blocking reads and
57229 has no data currently available:

57230 If O_NONBLOCK is set, *read*( ) shall return −1 and set *errno* to [EAGAIN].

57231 If O_NONBLOCK is clear, *read*( ) shall block the calling thread until some data becomes
57232 available.

57233 The use of the O_NONBLOCK flag has no effect if there is some data available.

57234 The *read*( ) function reads data previously written to a file. If any portion of a regular file prior to
57235 the end-of-file has not been written, *read*( ) shall return bytes with value 0. For example, *lseek*( )
57236 allows the file offset to be set beyond the end of existing data in the file. If data is later written at
57237 this point, subsequent reads in the gap between the previous end of data and the newly written
57238 data shall return bytes with value 0 until data is written into the gap.

57239 Upon successful completion, where *nbyte* is greater than 0, *read*( ) shall mark for update the last
57240 data access timestamp of the file, and shall return the number of bytes read. This number shall
57241 never be greater than *nbyte*. The value returned may be less than *nbyte* if the number of bytes

  
```

left in the file is less than *nbyte*, if the *read*( ) request was interrupted by a signal, or if the file is a pipe or FIFO or special file and has fewer than *nbyte* bytes immediately available for reading. For example, a *read*( ) from a file associated with a terminal may return one typed line of data.

If a *read*( ) is interrupted by a signal before it reads any data, it shall return −1 with *errno* set to [EINTR].

If a *read*( ) is interrupted by a signal after it has successfully read some data, it shall return the number of bytes read.

For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with *fildes*.

If *fildes* refers to a socket, *read*( ) shall be equivalent to *recv*( ) with no flags set.

SIO If the O_DSYNC and O_RSYNC bits have been set, read I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion. If the O_SYNC and O_RSYNC bits have been set, read I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.

SHM If *fildes* refers to a shared memory object, the result of the *read*( ) function is unspecified.

TYM If *fildes* refers to a typed memory object, the result of the *read*( ) function is unspecified.

OB XSR A *read*( ) from a STREAMS file can read data in three different modes: *byte-stream* mode, *message-nondiscard* mode, and *message-discard* mode. The default shall be byte-stream mode. This can be changed using the I_SRDOPT *ioctl*( ) request, and can be tested with I_GRDOPT *ioctl*( ). In byte-stream mode, *read*( ) shall retrieve data from the STREAM until as many bytes as were requested are transferred, or until there is no more data to be retrieved. Byte-stream mode ignores message boundaries.

In STREAMS message-nondiscard mode, *read*( ) shall retrieve data until as many bytes as were requested are transferred, or until a message boundary is reached. If *read*( ) does not retrieve all the data in a message, the remaining data shall be left on the STREAM, and can be retrieved by the next *read*( ) call. Message-discard mode also retrieves data until as many bytes as were requested are transferred, or a message boundary is reached. However, unread data remaining in a message after the *read*( ) returns shall be discarded, and shall not be available for a subsequent *read*( ), *getmsg*( ), or *getpmsg*( ) call.

How *read*( ) handles zero-byte STREAMS messages is determined by the current read mode setting. In byte-stream mode, *read*( ) shall accept data until it has read *nbyte* bytes, or until there is no more data to read, or until a zero-byte message block is encountered. The *read*( ) function shall then return the number of bytes read, and place the zero-byte message back on the STREAM to be retrieved by the next *read*( ), *getmsg*( ), or *getpmsg*( ). In message-nondiscard mode or message-discard mode, a zero-byte message shall return 0 and the message shall be removed from the STREAM. When a zero-byte message is read as the first message on a STREAM, the message shall be removed from the STREAM and 0 shall be returned, regardless of the read mode.

A *read*( ) from a STREAMS file shall return the data in the message at the front of the STREAM head read queue, regardless of the priority band of the message.

By default, STREAMs are in control-normal mode, in which a *read*( ) from a STREAMS file can only process messages that contain a data part but do not contain a control part. The *read*( ) shall fail if a message containing a control part is encountered at the STREAM head. This default action can be changed by placing the STREAM in either control-data mode or control-discard mode with the I_SRDOPT *ioctl*( ) command. In control-data mode, *read*( ) shall convert any control part to data and pass it to the application before passing any data part originally present

in the same message. In control-discard mode, *read*( ) shall discard message control parts but return to the process any data part in the message.

In addition, *read*( ) shall fail if the STREAM head had processed an asynchronous error before the call. In this case, the value of *errno* shall not reflect the result of *read*( ), but reflect the prior error. If a hangup occurs on the STREAM being read, *read*( ) shall continue to operate normally until the STREAM head read queue is empty. Thereafter, it shall return 0.

The *pread*( ) function shall be equivalent to *read*( ), except that it shall read from a given position in the file without changing the file offset. The first three arguments to *pread*( ) are the same as *read*( ) with the addition of a fourth argument *offset* for the desired position inside the file. An attempt to perform a *pread*( ) on a file that is incapable of seeking shall result in an error.

RETURN VALUE

Upon successful completion, these functions shall return a non-negative integer indicating the number of bytes actually read. Otherwise, the functions shall return −1 and set *errno* to indicate the error.

ERRORS

These functions shall fail if:

[EAGAIN] The file is neither a pipe, nor a FIFO, nor a socket, the O_NONBLOCK flag is set for the file descriptor, and the thread would be delayed in the read operation.

[EBADF] The *fildes* argument is not a valid file descriptor open for reading.

OB XSR [EBADMSG] The file is a STREAM file that is set to control-normal mode and the message waiting to be read includes a control part.

[EINTR] The read operation was terminated due to the receipt of a signal, and no data was transferred.

OB XSR [EINVAL] The STREAM or multiplexer referenced by *fildes* is linked (directly or indirectly) downstream from a multiplexer.

[EIO] The process is a member of a background process group attempting to read from its controlling terminal, and either the calling thread is blocking SIGTTIN or the process is ignoring SIGTTIN or the process group of the process is orphaned. This error may also be generated for implementation-defined reasons.

XSI [EISDIR] The *fildes* argument refers to a directory and the implementation does not allow the directory to be read using *read*( ) or *pread*( ). The *readdir*( ) function should be used instead.

[EOVERFLOW] The file is a regular file, *nbyte* is greater than 0, the starting position is before the end-of-file, and the starting position is greater than or equal to the offset maximum established in the open file description associated with *fildes*.

The *pread*( ) function shall fail if:

[EINVAL] The file is a regular file or block special file, and the *offset* argument is negative. The file offset shall remain unchanged.

[ESPIPE] The file is incapable of seeking.

The *read*( ) function shall fail if:

[EAGAIN] The file is a pipe or FIFO, the O_NONBLOCK flag is set for the file descriptor, and the thread would be delayed in the read operation.

[EAGAIN] or [EWOULDBLOCK]
The file is a socket, the O_NONBLOCK flag is set for the file descriptor, and the thread would be delayed in the read operation.

[ECONNRESET] A read was attempted on a socket and the connection was forcibly closed by its peer.

[ENOTCONN] A read was attempted on a socket that is not connected.

[ETIMEDOUT] A read was attempted on a socket and a transmission timeout occurred.

These functions may fail if:

[EIO] A physical I/O error has occurred.

[ENOBUFS] Insufficient resources were available in the system to perform the operation.

[ENOMEM] Insufficient memory was available to fulfill the request.

[ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

EXAMPLES

Reading Data into a Buffer

The following example reads data from the file associated with the file descriptor *fd* into the buffer pointed to by *buf*.

```
#include <sys/types.h>
#include <unistd.h>
...
char buf[20];
size_t nbytes;
ssize_t bytes_read;
int fd;
...
nbytes = sizeof(buf);
bytes_read = read(fd, buf, nbytes);
...
```

APPLICATION USAGE

None.

RATIONALE

This volume of POSIX.1-2017 does not specify the value of the file offset after an error is returned; there are too many cases. For programming errors, such as [EBADF], the concept is meaningless since no file is involved. For errors that are detected immediately, such as [EAGAIN], clearly the offset should not change. After an interrupt or hardware error, however, an updated value would be very useful and is the behavior of many implementations.

Note that a *read*( ) of zero bytes does not modify the last data access timestamp. A *read*( ) that requests more than zero bytes, but returns zero, is required to modify the last data access timestamp.

Implementations are allowed, but not required, to perform error checking for *read*( ) requests of zero bytes.

Input and Output

The use of I/O with large byte counts has always presented problems. Ideas such as *lread*( ) and *lwrite*( ) (using and returning **long**s) were considered at one time. The current solution is to use abstract types on the ISO C standard function to *read*( ) and *write*( ). The abstract types can be declared so that existing functions work, but can also be declared so that larger types can be represented in future implementations. It is presumed that whatever constraints limit the maximum range of **size_t** also limit portable I/O requests to the same range. This volume of POSIX.1-2017 also limits the range further by requiring that the byte count be limited so that a signed return value remains meaningful. Since the return type is also a (signed) abstract type, the byte count can be defined by the implementation to be larger than an **int** can hold.

The standard developers considered adding atomicity requirements to a pipe or FIFO, but recognized that due to the nature of pipes and FIFOs there could be no guarantee of atomicity of reads of {PIPE_BUF} or any other size that would be an aid to applications portability.

This volume of POSIX.1-2017 requires that no action be taken for *read*( ) or *write*( ) when *nbyte* is zero. This is not intended to take precedence over detection of errors (such as invalid buffer pointers or file descriptors). This is consistent with the rest of this volume of POSIX.1-2017, but the phrasing here could be misread to require detection of the zero case before any other errors. A value of zero is to be considered a correct value, for which the semantics are a no-op.

I/O is intended to be atomic to ordinary files and pipes and FIFOs. Atomic means that all the bytes from a single operation that started out together end up together, without interleaving from other I/O operations. It is a known attribute of terminals that this is not honored, and terminals are explicitly (and implicitly permanently) excepted, making the behavior unspecified. The behavior for other device types is also left unspecified, but the wording is intended to imply that future standards might choose to specify atomicity (or not).

There were recommendations to add format parameters to *read*( ) and *write*( ) in order to handle networked transfers among heterogeneous file system and base hardware types. Such a facility may be required for support by the OSI presentation of layer services. However, it was determined that this should correspond with similar C-language facilities, and that is beyond the scope of this volume of POSIX.1-2017. The concept was suggested to the developers of the ISO C standard for their consideration as a possible area for future work.

In 4.3 BSD, a *read*( ) or *write*( ) that is interrupted by a signal before transferring any data does not by default return an [EINTR] error, but is restarted. In 4.2 BSD, 4.3 BSD, and the Eighth Edition, there is an additional function, *select*( ), whose purpose is to pause until specified activity (data to read, space to write, and so on) is detected on specified file descriptors. It is common in applications written for those systems for *select*( ) to be used before *read*( ) in situations (such as keyboard input) where interruption of I/O due to a signal is desired.

The issue of which files or file types are interruptible is considered an implementation design issue. This is often affected primarily by hardware and reliability issues.

There are no references to actions taken following an ``unrecoverable error''. It is considered beyond the scope of this volume of POSIX.1-2017 to describe what happens in the case of hardware errors.

Earlier versions of this standard allowed two very different behaviors with regard to the handling of interrupts. In order to minimize the resulting confusion, it was decided that POSIX.1-2017 should support only one of these behaviors. Historical practice on AT&T-derived

systems was to have *read*( ) and *write*( ) return −1 and set *errno* to [EINTR] when interrupted after some, but not all, of the data requested had been transferred. However, the US Department of Commerce FIPS 151-1 and FIPS 151-2 require the historical BSD behavior, in which *read*( ) and *write*( ) return the number of bytes actually transferred before the interrupt. If −1 is returned when any data is transferred, it is difficult to recover from the error on a seekable device and impossible on a non-seekable device. Most new implementations support this behavior. The behavior required by POSIX.1-2017 is to return the number of bytes transferred.

POSIX.1-2017 does not specify when an implementation that buffers *read*( )s actually moves the data into the user-supplied buffer, so an implementation may choose to do this at the latest possible moment. Therefore, an interrupt arriving earlier may not cause *read*( ) to return a partial byte count, but rather to return −1 and set *errno* to [EINTR].

Consideration was also given to combining the two previous options, and setting *errno* to [EINTR] while returning a short count. However, not only is there no existing practice that implements this, it is also contradictory to the idea that when *errno* is set, the function responsible shall return −1.

This volume of POSIX.1-2017 intentionally does not specify any *pread*( ) errors related to pipes, FIFOs, and sockets other than [ESPIPE].

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

The *pread*( ) function is added.

Issue 6

The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

> The DESCRIPTION now states that if *read*( ) is interrupted by a signal after it has successfully read some data, it returns the number of bytes read. In Issue 3, it was optional whether *read*( ) returned the number of bytes read, or whether it returned −1 with *errno* set to [EINTR]. This is a FIPS requirement.
>
> In the DESCRIPTION, text is added to indicate that for regular files, no data transfer occurs past the offset maximum established in the open file description associated with *fildes*. This change is to support large files.
>
> The [EOVERFLOW] mandatory error condition is added.

The [ENXIO] optional error condition is added.

Text referring to sockets is added to the DESCRIPTION.

The following changes were made to align with the IEEE P1003.1a draft standard:

The effect of reading zero bytes is clarified.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *read*( ) results are unspecified for typed memory objects.

New RATIONALE is added to explain the atomicity requirements for input and output operations.

The following error conditions are added for operations on sockets: [EAGAIN], [ECONNRESET], [ENOTCONN], and [ETIMEDOUT].

The [EIO] error is made optional.

The following error conditions are added for operations on sockets: [ENOBUFS] and [ENOMEM].

The *readv*( ) function is split out into a separate reference page.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/108 is applied, updating the [EAGAIN] error in the ERRORS section from ``the process would be delayed'' to ``the thread would be delayed''.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/109 is applied, making an editorial correction in the RATIONALE section.

Issue 7

The *pread*( ) function is moved from the XSI option to the Base.

Functionality relating to the XSI STREAMS option is marked obsolescent.

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0480 [218], XSH/TC1-2008/0481 [79], XSH/TC1-2008/0482 [218], XSH/TC1-2008/0483 [218], XSH/TC1-2008/0484 [218], and XSH/TC1-2008/0485 [218,428] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0302 [710] and XSH/TC2-2008/0303 [676,710] are applied.

57487 **NAME**

57488 readdir, readdir_r — read a directory

57489 **SYNOPSIS**

57490 ```
#include <dirent.h>

struct dirent *readdir(DIR *dirp);
int readdir_r(DIR *restrict dirp, struct dirent *restrict entry,
    struct dirent **restrict result);
```

57494 **DESCRIPTION**

57495 The type **DIR**, which is defined in the **<dirent.h>** header, represents a *directory stream*, which is
57496 an ordered sequence of all the directory entries in a particular directory. Directory entries
57497 represent files; files may be removed from a directory or added to a directory asynchronously to
57498 the operation of *readdir*( ).

57499 The *readdir*( ) function shall return a pointer to a structure representing the directory entry at the
57500 current position in the directory stream specified by the argument *dirp*, and position the
57501 directory stream at the next entry. It shall return a null pointer upon reaching the end of the
57502 directory stream. The structure **dirent** defined in the **<dirent.h>** header describes a directory
57503 entry. The value of the structure's *d_ino* member shall be set to the file serial number of the file
57504 named by the *d_name* member. If the *d_name* member names a symbolic link, the value of the
57505 *d_ino* member shall be set to the file serial number of the symbolic link itself.

57506 The *readdir*( ) function shall not return directory entries containing empty names. If entries for
57507 dot or dot-dot exist, one entry shall be returned for dot and one entry shall be returned for dot-
57508 dot; otherwise, they shall not be returned.

57509 The application shall not modify the structure to which the return value of *readdir*( ) points, nor
57510 any storage areas pointed to by pointers within the structure. The returned pointer, and pointers
57511 within the structure, might be invalidated or the structure or the storage areas might be
57512 overwritten by a subsequent call to *readdir*( ) on the same directory stream. They shall not be
57513 affected by a call to *readdir*( ) on a different directory stream. The returned pointer, and pointers
57514 within the structure, might also be invalidated if the calling thread is terminated.

57515 If a file is removed from or added to the directory after the most recent call to *opendir*( ) or
57516 *rewinddir*( ), whether a subsequent call to *readdir*( ) returns an entry for that file is unspecified.

57517 The *readdir*( ) function may buffer several directory entries per actual read operation; *readdir*( )
57518 shall mark for update the last data access timestamp of the directory each time the directory is
57519 actually read.

57520 After a call to *fork*( ), either the parent or child (but not both) may continue processing the
57521 XSI directory stream using *readdir*( ), *rewinddir*( ), or *seekdir*( ). If both the parent and child processes
57522 use these functions, the result is undefined.

57523 The *readdir*( ) function need not be thread-safe.

57524 Applications wishing to check for error situations should set *errno* to 0 before calling *readdir*( ). If
57525 *errno* is set to non-zero on return, an error occurred.

57526 The *readdir_r*( ) function shall initialize the **dirent** structure referenced by *entry* to represent the
57527 directory entry at the current position in the directory stream referred to by *dirp*, store a pointer
57528 to this structure at the location referenced by *result*, and position the directory stream at the next
57529 entry.

57530 The storage pointed to by *entry* shall be large enough for a **dirent** with an array of **char** *d_name*
57531 members containing at least {NAME_MAX}+1 elements.

  
```

Upon successful return, the pointer returned at **result* shall have the same value as the argument *entry*. Upon reaching the end of the directory stream, this pointer shall have the value NULL.

The *readdir_r*( ) function shall not return directory entries containing empty names.

If a file is removed from or added to the directory after the most recent call to *opendir*( ) or *rewinddir*( ), whether a subsequent call to *readdir_r*( ) returns an entry for that file is unspecified.

The *readdir_r*( ) function may buffer several directory entries per actual read operation; *readdir_r*( ) shall mark for update the last data access timestamp of the directory each time the directory is actually read.

RETURN VALUE

Upon successful completion, *readdir*( ) shall return a pointer to an object of type **struct dirent**. When an error is encountered, a null pointer shall be returned and *errno* shall be set to indicate the error. When the end of the directory is encountered, a null pointer shall be returned and *errno* is not changed.

If successful, the *readdir_r*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions shall fail if:

[EOVERFLOW] One of the values in the structure to be returned cannot be represented correctly.

These functions may fail if:

[EBADF] The *dirp* argument does not refer to an open directory stream.

[ENOENT] The current position of the directory stream is invalid.

EXAMPLES

The following sample program searches the current directory for each of the arguments supplied on the command line.

```
#include <dirent.h>
#include <errno.h>
#include <stdio.h>
#include <string.h>

static void lookup(const char *arg)
{
    DIR *dirp;
    struct dirent *dp;

    if ((dirp = opendir(".")) == NULL) {
        perror("couldn't open '.'");
        return;
    }

    do {
        errno = 0;
        if ((dp = readdir(dirp)) != NULL) {
            if (strcmp(dp->d_name, arg) != 0)
                continue;

            (void) printf("found %s\n", arg);
            (void) closedir(dirp);
```

```
                    return;
            }
        } while (dp != NULL);
        if (errno != 0)
            perror("error reading directory");
        else
            (void) printf("failed to find %s\n", arg);
        (void) closedir(dirp);
        return;
    }
    int main(int argc, char *argv[])
    {
        int i;
        for (i = 1; i < argc; i++)
            lookup(argv[i]);
        return (0);
    }
```

APPLICATION USAGE

The *readdir*( ) function should be used in conjunction with *opendir*( ), *closedir*( ), and *rewinddir*( ) to examine the contents of the directory.

The *readdir_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

The returned value of *readdir*( ) merely *represents* a directory entry. No equivalence should be inferred.

Historical implementations of *readdir*( ) obtain multiple directory entries on a single read operation, which permits subsequent *readdir*( ) operations to operate from the buffered information. Any wording that required each successful *readdir*( ) operation to mark the directory last data access timestamp for update would disallow such historical performance-oriented implementations.

When returning a directory entry for the root of a mounted file system, some historical implementations of *readdir*( ) returned the file serial number of the underlying mount point, rather than of the root of the mounted file system. This behavior is considered to be a bug, since the underlying file serial number has no significance to applications.

Since *readdir*( ) returns NULL when it detects an error and when the end of the directory is encountered, an application that needs to tell the difference must set *errno* to zero before the call and check it if NULL is returned. Since the function must not change *errno* in the second case and must set it to a non-zero value in the first case, a zero *errno* after a call returning NULL indicates end-of-directory; otherwise, an error.

Routines to deal with this problem more directly were proposed:

```
int derror (dirp)
DIR *dirp;

void clearderr (dirp)
DIR *dirp;
```

The first would indicate whether an error had occurred, and the second would clear the error

indication. The simpler method involving *errno* was adopted instead by requiring that *readdir*( ) not change *errno* when end-of-directory is encountered.

An error or signal indicating that a directory has changed while open was considered but rejected.

The thread-safe version of the directory reading function returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call. Either the {NAME_MAX} compile-time constant or the corresponding *pathconf*( ) option can be used to determine the maximum sizes of returned pathnames.

FUTURE DIRECTIONS

None.

XBD **<dirent.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 2.

Issue 5

Large File Summit extensions are added.

The *readdir_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *readdir*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *readdir_r*( ) function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir_r*( ).

The Open Group Corrigendum U026/8 is applied, clarifying the wording of the successful return for the *readdir_r*( ) function.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

- A statement is added to the DESCRIPTION indicating the disposition of certain fields in **struct dirent** when an entry refers to a symbolic link.

- The [EOVERFLOW] mandatory error condition is added. This change is to support large files.

- The [ENOENT] optional error condition is added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *readdir_r*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/50 is applied, replacing the EXAMPLES section with a new example.

Issue 7

Austin Group Interpretation 1003.1-2001 #059 is applied, updating the ERRORS section.

Austin Group Interpretation 1003.1-2001 #156 is applied.

The *readdir_r*( ) function is moved from the Thread-Safe Functions option to the Base.

Changes are made related to support for finegrained timestamps.

The value of the *d_ino* member is no longer unspecified for symbolic links.

SD5-XSH-ERN-193 is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0486 [75] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0304 [656] is applied.

57671 **NAME**

57672 readlink, readlinkat — read the contents of a symbolic link

57673 **SYNOPSIS**

57674
```
#include <unistd.h>
```

57675
```
ssize_t readlink(const char *restrict path, char *restrict buf,
    size_t bufsize);
```

57677 OH
```
#include <fcntl.h>
```

57678
```
ssize_t readlinkat(int fd, const char *restrict path,
    char *restrict buf, size_t bufsize);
```

57680 **DESCRIPTION**

57681 The *readlink*( ) function shall place the contents of the symbolic link referred to by *path* in the
57682 buffer *buf* which has size *bufsize*. If the number of bytes in the symbolic link is less than *bufsize*,
57683 the contents of the remainder of *buf* are unspecified. If the *buf* argument is not large enough to
57684 contain the link content, the first *bufsize* bytes shall be placed in *buf*.

57685 If the value of *bufsize* is greater than {SSIZE_MAX}, the result is implementation-defined.

57686 Upon successful completion, *readlink*( ) shall mark for update the last data access timestamp of
57687 the symbolic link.

57688 The *readlinkat*( ) function shall be equivalent to the *readlink*( ) function except in the case where
57689 *path* specifies a relative path. In this case the symbolic link whose content is read is relative to the
57690 directory associated with the file descriptor *fd* instead of the current working directory. If the
57691 access mode of the open file description associated with the file descriptor is not O_SEARCH,
57692 the function shall check whether directory searches are permitted using the current permissions
57693 of the directory underlying the file descriptor. If the access mode is O_SEARCH, the function
57694 shall not perform the check.

57695 If *readlinkat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working
57696 directory shall be used and the behavior shall be identical to a call to *readlink*( ).

57697 **RETURN VALUE**

57698 Upon successful completion, these functions shall return the count of bytes placed in the buffer.
57699 Otherwise, these functions shall return a value of −1, leave the buffer unchanged, and set *errno* to
57700 indicate the error.

57701 **ERRORS**

57702 These functions shall fail if:

57703 [EACCES] Search permission is denied for a component of the path prefix of *path*.

57704 [EINVAL] The *path* argument names a file that is not a symbolic link.

57705 [EIO] An I/O error occurred while reading from the file system.

57706 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
57707 argument.

57708 [ENAMETOOLONG]
57709 The length of a component of a pathname is longer than {NAME_MAX}.

57710 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

57711 [ENOTDIR] A component of the path prefix names an existing file that is neither a
57712 directory nor a symbolic link to a directory, or the *path* argument contains at
57713 least one non-<slash> character and ends with one or more trailing <slash>

57714 characters and the last pathname component names an existing file that is
57715 neither a directory nor a symbolic link to a directory.

57716 The *readlinkat*( ) function shall fail if:

57717 [EACCES] The access mode of the open file description associated with *fd* is not
57718 O_SEARCH and the permissions of the directory underlying *fd* do not permit
57719 directory searches.

57720 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is
57721 neither AT_FDCWD nor a valid file descriptor open for reading or searching.

57722 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated
57723 with a non-directory file.

57724 These functions may fail if:

57725 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
57726 resolution of the *path* argument.

57727 [ENAMETOOLONG]
57728 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
57729 symbolic link produced an intermediate result with a length that exceeds
57730 {PATH_MAX}.

57731 **EXAMPLES**

57732 **Reading the Name of a Symbolic Link**

57733 The following example shows how to read the name of a symbolic link named **/modules/pass1**.

57734
```
#include <unistd.h>
```

57735
```
char buf[1024];
```
57736
```
ssize_t len;
```
57737
```
...
```
57738
```
if ((len = readlink("/modules/pass1", buf, sizeof(buf)-1)) != -1)
```
57739
```
    buf[len] = '\0';
```

57740 **APPLICATION USAGE**

57741 Conforming applications should not assume that the returned contents of the symbolic link are
57742 null-terminated.

57743 **RATIONALE**

57744 The type associated with *bufsiz* is a **size_t** in order to be consistent with both the ISO C standard
57745 and the definition of *read*( ). The behavior specified for *readlink*( ) when *bufsiz* is zero represents
57746 historical practice. For this case, the standard developers considered a change whereby *readlink*( )
57747 would return the number of non-null bytes contained in the symbolic link with the buffer *buf*
57748 remaining unchanged; however, since the **stat** structure member *st_size* value can be used to
57749 determine the size of buffer necessary to contain the contents of the symbolic link as returned by
57750 *readlink*( ), this proposal was rejected, and the historical practice retained.

57751 The purpose of the *readlinkat*( ) function is to read the content of symbolic links in directories
57752 other than the current working directory without exposure to race conditions. Any part of the
57753 path of a file could be changed in parallel to a call to *readlink*( ), resulting in unspecified behavior.
57754 By opening a file descriptor for the target directory and using the *readlinkat*( ) function it can be
57755 guaranteed that the symbolic link read is located relative to the desired directory.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The return type is changed to **ssize_t**, to align with the IEEE P1003.1a draft standard.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

> This function is made mandatory.
>
> In this function it is possible for the return value to exceed the range of the type **ssize_t** (since **size_t** has a larger range of positive values than **ssize_t**). A sentence restricting the size of the **size_t** object is added to the description to resolve this conflict.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

> The FUTURE DIRECTIONS section is changed to None.

The following changes were made to align with the IEEE P1003.1a draft standard:

> The [ELOOP] optional error condition is added.

The **restrict** keyword is added to the *readlink*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

SD5-XSH-ERN-189 is applied, updating the ERRORS section.

The *readlinkat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The [EACCES] error is removed from the ``may fail'' error conditions.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0487 [120], XSH/TC1-2008/0488 [461], XSH/TC1-2008/0489 [143], XSH/TC1-2008/0490 [324], XSH/TC1-2008/0491 [278], XSH/TC1-2008/0492 [278], XSH/TC1-2008/0493 [455], and XSH/TC1-2008/0494 [151,231] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0305 [591], XSH/TC2-2008/0306 [817], XSH/TC2-2008/0307 [817], and XSH/TC2-2008/0308 [591] are applied.

NAME

readv — read a vector

SYNOPSIS

XSI
```
#include <sys/uio.h>

ssize_t readv(int fildes, const struct iovec *iov, int iovcnt);
```

DESCRIPTION

The *readv*( ) function shall be equivalent to *read*( ), except as described below. The *readv*( ) function shall place the input data into the *iovcnt* buffers specified by the members of the *iov* array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*–1]. The *iovcnt* argument is valid if greater than 0 and less than or equal to {IOV_MAX}.

Each *iovec* entry specifies the base address and length of an area in memory where data should be placed. The *readv*( ) function shall always fill an area completely before proceeding to the next.

Upon successful completion, *readv*( ) shall mark for update the last data access timestamp of the file.

RETURN VALUE

Refer to *read*( ).

ERRORS

Refer to *read*( ).

In addition, the *readv*( ) function shall fail if:

[EINVAL] The sum of the *iov_len* values in the *iov* array overflowed an **ssize_t**.

The *readv*( ) function may fail if:

[EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV_MAX}.

EXAMPLES

Reading Data into an Array

The following example reads data from the file associated with the file descriptor *fd* into the buffers specified by members of the *iov* array.

```
#include <sys/types.h>
#include <sys/uio.h>
#include <unistd.h>
...
ssize_t bytes_read;
int fd;
char buf0[20];
char buf1[30];
char buf2[40];
int iovcnt;
struct iovec iov[3];

iov[0].iov_base = buf0;
iov[0].iov_len = sizeof(buf0);
iov[1].iov_base = buf1;
iov[1].iov_len = sizeof(buf1);
iov[2].iov_base = buf2;
```

```
        iov[2].iov_len = sizeof(buf2);
        ...
        iovcnt = sizeof(iov) / sizeof(struct iovec);
        bytes_read = readv(fd, iov, iovcnt);
        ...
```

APPLICATION USAGE

None.

RATIONALE

Refer to *read*( ).

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 6

Split out from the *read*( ) reference page.

Issue 7

Changes are made related to support for finegrained timestamps.

NAME

realloc — memory reallocator

SYNOPSIS

```
#include <stdlib.h>

void *realloc(void *ptr, size_t size);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *realloc*( ) function shall deallocate the old object pointed to by *ptr* and return a pointer to a new object that has the size specified by *size*. The contents of the new object shall be the same as that of the old object prior to deallocation, up to the lesser of the new and old sizes. Any bytes in the new object beyond the size of the old object have indeterminate values. If the size of the space requested is zero, the behavior shall be implementation-defined: either a null pointer is returned, or the behavior shall be as if the size were some non-zero value, except that the behavior is undefined if the returned pointer is used to access an object. If the space cannot be allocated, the object shall remain unchanged.

If *ptr* is a null pointer, *realloc*( ) shall be equivalent to *malloc*( ) for the specified size.

If *ptr* does not match a pointer returned earlier by *calloc*( ), *malloc*( ), or *realloc*( ) or if the space has previously been deallocated by a call to *free*( ) or *realloc*( ), the behavior is undefined.

The order and contiguity of storage allocated by successive calls to *realloc*( ) is unspecified. The pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to a pointer to any type of object and then used to access such an object in the space allocated (until the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object disjoint from any other object. The pointer returned shall point to the start (lowest byte address) of the allocated space. If the space cannot be allocated, a null pointer shall be returned.

RETURN VALUE

Upon successful completion, *realloc*( ) shall return a pointer to the (possibly moved) allocated space. If *size* is 0, either:

CX A null pointer shall be returned and, if *ptr* is not a null pointer, *errno* shall be set to an implementation-defined value.

A pointer to the allocated space shall be returned, and the memory object pointed to by *ptr* shall be freed. The application shall ensure that the pointer is not used to access an object.

CX If there is not enough available memory, *realloc*( ) shall return a null pointer and set *errno* to CX [ENOMEM]. If *realloc*( ) returns a null pointer and *errno* has been set to [ENOMEM], the memory referenced by *ptr* shall not be changed.

ERRORS

The *realloc*( ) function shall fail if:

CX [ENOMEM] Insufficient memory is available.

EXAMPLES

None.

APPLICATION USAGE

The description of *realloc*( ) has been modified from previous versions of this standard to align with the ISO/IEC 9899: 1999 standard. Previous versions explicitly permitted a call to *realloc*(*p*, *0)* *to free the space pointed to by p and return a null pointer. While this behavior could be interpreted as permitted by this version of the standard, the C language committee have indicated that this interpretation is incorrect. Applications should assume that if realloc( ) returns a null pointer, the space pointed to by p has not been freed. Since this could lead to double-frees, implementations should also set errno if a null pointer actually indicates a failure, and applications should only free the space if errno was changed.*

RATIONALE

None.

FUTURE DIRECTIONS

This standard defers to the ISO C standard. While that standard currently has language that might permit *realloc*(*p*, *0), where p is not a null pointer, to free p while still returning a null pointer, the committee responsible for that standard is considering clarifying the language to explicitly prohibit that alternative.*

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, if there is not enough available memory, the setting of *errno* to [ENOMEM] is added.
- The [ENOMEM] error condition is added.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0495 [400], XSH/TC1-2008/0496 [400], XSH/TC1-2008/0497 [400], and XSH/TC1-2008/0498 [400] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0309 [526] and XSH/TC2-2008/0310 [526,688] are applied.

NAME

realpath — resolve a pathname

SYNOPSIS

XSI
```
#include <stdlib.h>

char *realpath(const char *restrict file_name,
    char *restrict resolved_name);
```

DESCRIPTION

The *realpath*( ) function shall derive, from the pathname pointed to by *file_name*, an absolute pathname that resolves to the same directory entry, whose resolution does not involve `'.'`, `'..'`, or symbolic links. If *resolved_name* is a null pointer, the generated pathname shall be stored as a null-terminated string in a buffer allocated as if by a call to *malloc*( ). Otherwise, if {PATH_MAX} is defined as a constant in the **<limits.h>** header, then the generated pathname shall be stored as a null-terminated string, up to a maximum of {PATH_MAX} bytes, in the buffer pointed to by *resolved_name*.

If *resolved_name* is not a null pointer and {PATH_MAX} is not defined as a constant in the **<limits.h>** header, the behavior is undefined.

RETURN VALUE

Upon successful completion, *realpath*( ) shall return a pointer to the buffer containing the resolved name. Otherwise, *realpath*( ) shall return a null pointer and set *errno* to indicate the error.

If the *resolved_name* argument is a null pointer, the pointer returned by *realpath*( ) can be passed to *free*( ).

If the *resolved_name* argument is not a null pointer and the *realpath*( ) function fails, the contents of the buffer pointed to by *resolved_name* are undefined.

ERRORS

The *realpath*( ) function shall fail if:

[EACCES] Search permission was denied for a component of the path prefix of *file_name*.

[EINVAL] The *file_name* argument is a null pointer.

[EIO] An error occurred while reading from the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *file_name* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *file_name* does not name an existing file or *file_name* points to an empty string.

[ENOTDIR] A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the *file_name* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

The *realpath*( ) function may fail if:

[EACCES] The *file_name* argument does not begin with a <slash> and none of the symbolic links (if any) processed during pathname resolution of *file_name* had contents that began with a <slash>, and either search permission was denied for the current directory or read or search permission was denied for a directory above the current directory in the file hierarchy.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *file_name* argument.

[ENAMETOOLONG] The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[ENOMEM] Insufficient storage space is available.

EXAMPLES

Generating an Absolute Pathname

The following example generates an absolute pathname for the file identified by the *symlinkpath* argument. The generated pathname is stored in the buffer pointed to by *actualpath*.

```
#include <stdlib.h>
...
char *symlinkpath = "/tmp/symlink/file";
char *actualpath;

actualpath = realpath(symlinkpath, NULL);
if (actualpath != NULL)
{
    ... use actualpath ...

    free(actualpath);
}
else
{
    ... handle error ...
}
```

APPLICATION USAGE

For functions that allocate memory as if by *malloc*( ), the application should release such memory when it is no longer required by a call to *free*( ). For *realpath*( ), this is the return value.

RATIONALE

Since *realpath*( ) has no *length* argument, if {PATH_MAX} is not defined as a constant in **<limits.h>**, applications have no way of determining how large a buffer they need to allocate for it to be safe to pass to *realpath*( ). A {PATH_MAX} value obtained from a prior *pathconf*( ) call is out-of-date by the time *realpath*( ) is called. Hence the only reliable way to use *realpath*( ) when {PATH_MAX} is not defined in **<limits.h>** is to pass a null pointer for *resolved_name* so that *realpath*( ) will allocate a buffer of the necessary size.

FUTURE DIRECTIONS

None.

fpathconf( ), *free*( ), *getcwd*( ), *sysconf*( )

XBD **<limits.h>**, **<stdlib.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The **restrict** keyword is added to the *realpath*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/51 is applied, adding new text to the DESCRIPTION for the case when *resolved_name* is a null pointer, changing the [EINVAL] error text, adding text to the RATIONALE, and adding text to FUTURE DIRECTIONS.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/110 is applied, updating the ERRORS section to refer to the *file_name* argument, rather than a nonexistent *path* argument.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

This function is updated for passing a null pointer to *realpath*( ) for the *resolved_name* argument.

The APPLICATION USAGE section is updated to clarify that memory is allocated as if by *malloc*( ).

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0499 [353], XSH/TC1-2008/0500 [324], and XSH/TC1-2008/0501 [353] are applied.

58037 **NAME**

58038 recv — receive a message from a connected socket

58039 **SYNOPSIS**

58040 `#include <sys/socket.h>`

58041 `ssize_t recv(int socket, void *buffer, size_t length, int flags);`

58042 **DESCRIPTION**

58043 The *recv*( ) function shall receive a message from a connection-mode or connectionless-mode
58044 socket. It is normally used with connected sockets because it does not permit the application to
58045 retrieve the source address of received data.

58046 The *recv*( ) function takes the following arguments:

58047 *socket* Specifies the socket file descriptor.

58048 *buffer* Points to a buffer where the message should be stored.

58049 *length* Specifies the length in bytes of the buffer pointed to by the *buffer* argument.

58050 *flags* Specifies the type of message reception. Values of this argument are formed by
58051 logically OR'ing zero or more of the following values:

58052 MSG_PEEK Peeks at an incoming message. The data is treated as unread and
58053 the next *recv*( ) or similar function shall still return this data.

58054 MSG_OOB Requests out-of-band data. The significance and semantics of
58055 out-of-band data are protocol-specific.

58056 MSG_WAITALL On SOCK_STREAM sockets this requests that the function block
58057 until the full amount of data can be returned. The function may
58058 return the smaller amount of data if the socket is a message-
58059 based socket, if a signal is caught, if the connection is terminated,
58060 if MSG_PEEK was specified, or if an error is pending for the
58061 socket.

58062 The *recv*( ) function shall return the length of the message written to the buffer pointed to by the
58063 *buffer* argument. For message-based sockets, such as SOCK_DGRAM and SOCK_SEQPACKET,
58064 the entire message shall be read in a single operation. If a message is too long to fit in the
58065 supplied buffer, and MSG_PEEK is not set in the *flags* argument, the excess bytes shall be
58066 discarded. For stream-based sockets, such as SOCK_STREAM, message boundaries shall be
58067 ignored. In this case, data shall be returned to the user as soon as it becomes available, and no
58068 data shall be discarded.

58069 If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first
58070 message.

58071 If no messages are available at the socket and O_NONBLOCK is not set on the socket's file
58072 descriptor, *recv*( ) shall block until a message arrives. If no messages are available at the socket
58073 and O_NONBLOCK is set on the socket's file descriptor, *recv*( ) shall fail and set *errno* to
58074 [EAGAIN] or [EWOULDBLOCK].

58075 **RETURN VALUE**

58076 Upon successful completion, *recv*( ) shall return the length of the message in bytes. If no
58077 messages are available to be received and the peer has performed an orderly shutdown, *recv*( )
58078 shall return 0. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *recv*( ) function shall fail if:

[EAGAIN] or [EWOULDBLOCK]
: The socket's file descriptor is marked O_NONBLOCK and no data is waiting to be received; or MSG_OOB is set and no out-of-band data is available and either the socket's file descriptor is marked O_NONBLOCK or the socket does not support blocking to await out-of-band data.

[EBADF]
: The *socket* argument is not a valid file descriptor.

[ECONNRESET]
: A connection was forcibly closed by a peer.

[EINTR]
: The *recv*( ) function was interrupted by a signal that was caught, before any data was available.

[EINVAL]
: The MSG_OOB flag is set and no out-of-band data is available.

[ENOTCONN]
: A receive is attempted on a connection-mode socket that is not connected.

[ENOTSOCK]
: The *socket* argument does not refer to a socket.

[EOPNOTSUPP]
: The specified flags are not supported for this socket type or protocol.

[ETIMEDOUT]
: The connection timed out during connection establishment, or due to a transmission timeout on active connection.

The *recv*( ) function may fail if:

[EIO]
: An I/O error occurred while reading from or writing to the file system.

[ENOBUFS]
: Insufficient resources were available in the system to perform the operation.

[ENOMEM]
: Insufficient memory was available to fulfill the request.

EXAMPLES

None.

APPLICATION USAGE

The *recv*( ) function is equivalent to *recvfrom*( ) with null pointer *address* and *address_len* arguments, and to *read*( ) if the *socket* argument refers to a socket and the *flags* argument is 0.

The *select*( ) and *poll*( ) functions can be used to determine when data is available to be received.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<sys/socket.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

58116 **Issue 7**
58117 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0502 [462] is applied.

58118 **NAME**

58119 recvfrom — receive a message from a socket

58120 **SYNOPSIS**

58121 ```
#include <sys/socket.h>
```

58122 ```
ssize_t recvfrom(int socket, void *restrict buffer, size_t length,
```
58123 ```
    int flags, struct sockaddr *restrict address,
```
58124 ```
    socklen_t *restrict address_len);
```

58125 **DESCRIPTION**

58126 The *recvfrom*( ) function shall receive a message from a connection-mode or connectionless-mode
58127 socket. It is normally used with connectionless-mode sockets because it permits the application
58128 to retrieve the source address of received data.

58129 The *recvfrom*( ) function takes the following arguments:

58130 *socket* Specifies the socket file descriptor.

58131 *buffer* Points to the buffer where the message should be stored.

58132 *length* Specifies the length in bytes of the buffer pointed to by the *buffer* argument.

58133 *flags* Specifies the type of message reception. Values of this argument are formed by
58134 logically OR'ing zero or more of the following values:

58135 MSG_PEEK Peeks at an incoming message. The data is treated as unread
58136 and the next *recvfrom*( ) or similar function shall still return
58137 this data.

58138 MSG_OOB Requests out-of-band data. The significance and semantics
58139 of out-of-band data are protocol-specific.

58140 MSG_WAITALL On SOCK_STREAM sockets this requests that the function
58141 block until the full amount of data can be returned. The
58142 function may return the smaller amount of data if the socket
58143 is a message-based socket, if a signal is caught, if the
58144 connection is terminated, if MSG_PEEK was specified, or if
58145 an error is pending for the socket.

58146 *address* A null pointer, or points to a **sockaddr** structure in which the sending address
58147 is to be stored. The length and format of the address depend on the address
58148 family of the socket.

58149 *address_len* Either a null pointer, if *address* is a null pointer, or a pointer to a **socklen_t**
58150 object which on input specifies the length of the supplied **sockaddr** structure,
58151 and on output specifies the length of the stored address.

58152 The *recvfrom*( ) function shall return the length of the message written to the buffer pointed to by
58153 RS the *buffer* argument. For message-based sockets, such as SOCK_RAW, SOCK_DGRAM, and
58154 SOCK_SEQPACKET, the entire message shall be read in a single operation. If a message is too
58155 long to fit in the supplied buffer, and MSG_PEEK is not set in the *flags* argument, the excess
58156 bytes shall be discarded. For stream-based sockets, such as SOCK_STREAM, message
58157 boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes
58158 available, and no data shall be discarded.

58159 If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first
58160 message.

58161 Not all protocols provide the source address for messages. If the *address* argument is not a null

pointer and the protocol provides the source address of messages, the source address of the received message shall be stored in the **sockaddr** structure pointed to by the *address* argument, and the length of this address shall be stored in the object pointed to by the *address_len* argument.

If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated.

If the *address* argument is not a null pointer and the protocol does not provide the source address of messages, the value stored in the object pointed to by *address* is unspecified.

If no messages are available at the socket and O_NONBLOCK is not set on the socket's file descriptor, *recvfrom*( ) shall block until a message arrives. If no messages are available at the socket and O_NONBLOCK is set on the socket's file descriptor, *recvfrom*( ) shall fail and set *errno* to [EAGAIN] or [EWOULDBLOCK].

RETURN VALUE

Upon successful completion, *recvfrom*( ) shall return the length of the message in bytes. If no messages are available to be received and the peer has performed an orderly shutdown, *recvfrom*( ) shall return 0. Otherwise, the function shall return −1 and set *errno* to indicate the error.

ERRORS

The *recvfrom*( ) function shall fail if:

[EAGAIN] or [EWOULDBLOCK]
: The socket's file descriptor is marked O_NONBLOCK and no data is waiting to be received; or MSG_OOB is set and no out-of-band data is available and either the socket's file descriptor is marked O_NONBLOCK or the socket does not support blocking to await out-of-band data.

[EBADF]
: The *socket* argument is not a valid file descriptor.

[ECONNRESET]
: A connection was forcibly closed by a peer.

[EINTR]
: A signal interrupted *recvfrom*( ) before any data was available.

[EINVAL]
: The MSG_OOB flag is set and no out-of-band data is available.

[ENOTCONN]
: A receive is attempted on a connection-mode socket that is not connected.

[ENOTSOCK]
: The *socket* argument does not refer to a socket.

[EOPNOTSUPP]
: The specified flags are not supported for this socket type.

[ETIMEDOUT]
: The connection timed out during connection establishment, or due to a transmission timeout on active connection.

The *recvfrom*( ) function may fail if:

[EIO]
: An I/O error occurred while reading from or writing to the file system.

[ENOBUFS]
: Insufficient resources were available in the system to perform the operation.

[ENOMEM]
: Insufficient memory was available to fulfill the request.

58199 **EXAMPLES**

58200 None.

58201 **APPLICATION USAGE**

58202 The *select*( ) and *poll*( ) functions can be used to determine when data is available to be received.

58203 **RATIONALE**

58204 None.

58209 XBD **<sys/socket.h>**

58210 **CHANGE HISTORY**

58211 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

58212 **Issue 7**

58213 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0503 [464] is applied.

58214 **NAME**

58215 recvmsg — receive a message from a socket

58216 **SYNOPSIS**

58217 `#include <sys/socket.h>`

58218 `ssize_t recvmsg(int socket, struct msghdr *message, int flags);`

58219 **DESCRIPTION**

58220 The *recvmsg*( ) function shall receive a message from a connection-mode or connectionless-mode
58221 socket. It is normally used with connectionless-mode sockets because it permits the application
58222 to retrieve the source address of received data.

58223 The *recvmsg*( ) function takes the following arguments:

58224 *socket* Specifies the socket file descriptor.

58225 *message* Points to a **msghdr** structure, containing both the buffer to store the source
58226 address and the buffers for the incoming message. The length and format of
58227 the address depend on the address family of the socket. The *msg_flags* member
58228 is ignored on input, but may contain meaningful values on output.

58229 *flags* Specifies the type of message reception. Values of this argument are formed by
58230 logically OR'ing zero or more of the following values:

58231 MSG_OOB Requests out-of-band data. The significance and semantics
58232 of out-of-band data are protocol-specific.

58233 MSG_PEEK Peeks at the incoming message.

58234 MSG_WAITALL On SOCK_STREAM sockets this requests that the function
58235 block until the full amount of data can be returned. The
58236 function may return the smaller amount of data if the socket
58237 is a message-based socket, if a signal is caught, if the
58238 connection is terminated, if MSG_PEEK was specified, or if
58239 an error is pending for the socket.

58240 The *recvmsg*( ) function shall receive messages from unconnected or connected sockets and shall
58241 return the length of the message.

58242 The *recvmsg*( ) function shall return the total length of the message. For message-based sockets,
58243 such as SOCK_DGRAM and SOCK_SEQPACKET, the entire message shall be read in a single
58244 operation. If a message is too long to fit in the supplied buffers, and MSG_PEEK is not set in the
58245 *flags* argument, the excess bytes shall be discarded, and MSG_TRUNC shall be set in the
58246 *msg_flags* member of the **msghdr** structure. For stream-based sockets, such as SOCK_STREAM,
58247 message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it
58248 becomes available, and no data shall be discarded.

58249 If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first
58250 message.

58251 If no messages are available at the socket and O_NONBLOCK is not set on the socket's file
58252 descriptor, *recvmsg*( ) shall block until a message arrives. If no messages are available at the
58253 socket and O_NONBLOCK is set on the socket's file descriptor, the *recvmsg*( ) function shall fail
58254 and set *errno* to [EAGAIN] or [EWOULDBLOCK].

58255 In the **msghdr** structure, the *msg_name* member may be a null pointer if the source address is not
58256 required. Otherwise, if the socket is unconnected, the *msg_name* member points to a **sockaddr**
58257 structure in which the source address is to be stored, and the *msg_namelen* member on input
58258 specifies the length of the supplied **sockaddr** structure and on output specifies the length of the

stored address. If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated. If the socket is connected, the *msg_name* and *msg_namelen* members shall be ignored. The *msg_iov* and *msg_iovlen* fields are used to specify where the received data shall be stored. The *msg_iov* member points to an array of **iovec** structures; the *msg_iovlen* member shall be set to the dimension of this array. In each **iovec** structure, the *iov_base* field specifies a storage area and the *iov_len* field gives its size in bytes. Each storage area indicated by *msg_iov* is filled with received data in turn until all of the received data is stored or all of the areas have been filled.

Upon successful completion, the *msg_flags* member of the message header shall be the bitwise-inclusive OR of all of the following flags that indicate conditions detected for the received message:

MSG_EOR End-of-record was received (if supported by the protocol).

MSG_OOB Out-of-band data was received.

MSG_TRUNC Normal data was truncated.

MSG_CTRUNC Control data was truncated.

RETURN VALUE

Upon successful completion, *recvmsg*( ) shall return the length of the message in bytes. If no messages are available to be received and the peer has performed an orderly shutdown, *recvmsg*( ) shall return 0. Otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *recvmsg*( ) function shall fail if:

[EAGAIN] or [EWOULDBLOCK]
The socket's file descriptor is marked O_NONBLOCK and no data is waiting to be received; or MSG_OOB is set and no out-of-band data is available and either the socket's file descriptor is marked O_NONBLOCK or the socket does not support blocking to await out-of-band data.

[EBADF] The *socket* argument is not a valid open file descriptor.

[ECONNRESET] A connection was forcibly closed by a peer.

[EINTR] This function was interrupted by a signal before any data was available.

[EINVAL] The sum of the *iov_len* values overflows a **ssize_t**, or the MSG_OOB flag is set and no out-of-band data is available.

[EMSGSIZE] The *msg_iovlen* member of the **msghdr** structure pointed to by *message* is less than or equal to 0, or is greater than {IOV_MAX}.

[ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EOPNOTSUPP] The specified flags are not supported for this socket type.

[ETIMEDOUT] The connection timed out during connection establishment, or due to a transmission timeout on active connection.

The *recvmsg*( ) function may fail if:

[EIO] An I/O error occurred while reading from or writing to the file system.

58299 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

58300 [ENOMEM] Insufficient memory was available to fulfill the request.

58301 **EXAMPLES**

58302 None.

58303 **APPLICATION USAGE**

58304 The *select*( ) and *poll*( ) functions can be used to determine when data is available to be received.

58305 **RATIONALE**

58306 None.

58307 **FUTURE DIRECTIONS**

58308 None.

NAME

regcomp, regerror, regexec, regfree — regular expression matching

SYNOPSIS

```
#include <regex.h>

int regcomp(regex_t *restrict preg, const char *restrict pattern,
    int cflags);
size_t regerror(int errcode, const regex_t *restrict preg,
    char *restrict errbuf, size_t errbuf_size);
int regexec(const regex_t *restrict preg, const char *restrict string,
    size_t nmatch, regmatch_t pmatch[restrict], int eflags);
void regfree(regex_t *preg);
```

DESCRIPTION

These functions interpret *basic* and *extended* regular expressions as described in XBD Chapter 9 (on page 181).

The **regex_t** structure is defined in **<regex.h>** and contains at least the following member:

Member Type	Member Name	Description
size_t	*re_nsub*	Number of parenthesized subexpressions.

The **regmatch_t** structure is defined in **<regex.h>** and contains at least the following members:

Member Type	Member Name	Description
regoff_t	*rm_so*	Byte offset from start of *string* to start of substring.
regoff_t	*rm_eo*	Byte offset from start of *string* of the first character after the end of substring.

The *regcomp*( ) function shall compile the regular expression contained in the string pointed to by the *pattern* argument and place the results in the structure pointed to by *preg*. The *cflags* argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in the **<regex.h>** header:

REG_EXTENDED Use Extended Regular Expressions.

REG_ICASE Ignore case in match (see XBD Chapter 9, on page 181).

REG_NOSUB Report only success/fail in *regexec*( ).

REG_NEWLINE Change the handling of <newline> characters, as described in the text.

The default regular expression type for *pattern* is a Basic Regular Expression. The application can specify Extended Regular Expressions using the REG_EXTENDED *cflags* flag.

If the REG_NOSUB flag was not set in *cflags*, then *regcomp*( ) shall set *re_nsub* to the number of parenthesized subexpressions (delimited by `"\(\)"` in basic regular expressions or `"()"` in extended regular expressions) found in *pattern*.

The *regexec*( ) function compares the null-terminated string specified by *string* with the compiled regular expression *preg* initialized by a previous call to *regcomp*( ). If it finds a match, *regexec*( ) shall return 0; otherwise, it shall return non-zero indicating either no match or an error. The *eflags* argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in the **<regex.h>** header:

58358 REG_NOTBOL The first character of the string pointed to by *string* is not the beginning of
58359 the line. Therefore, the <circumflex> character (`'^'`), when taken as a
58360 special character, shall not match the beginning of *string*.

58361 REG_NOTEOL The last character of the string pointed to by *string* is not the end of the
58362 line. Therefore, the <dollar-sign> (`'$'`), when taken as a special character,
58363 shall not match the end of *string*.

58364 If *nmatch* is 0 or REG_NOSUB was set in the *cflags* argument to *regcomp*( ), then *regexec*( ) shall
58365 ignore the *pmatch* argument. Otherwise, the application shall ensure that the *pmatch* argument
58366 points to an array with at least *nmatch* elements, and *regexec*( ) shall fill in the elements of that
58367 array with offsets of the substrings of *string* that correspond to the parenthesized subexpressions
58368 of *pattern*: *pmatch*[*i*].*rm_so* shall be the byte offset of the beginning and *pmatch*[*i*].*rm_eo* shall be
58369 one greater than the byte offset of the end of substring *i*. (Subexpression *i* begins at the *i*th
58370 matched open parenthesis, counting from 1.) Offsets in *pmatch*[0] identify the substring that
58371 corresponds to the entire regular expression. Unused elements of *pmatch* up to *pmatch*[*nmatch*−1]
58372 shall be filled with −1. If there are more than *nmatch* subexpressions in *pattern* (*pattern* itself
58373 counts as a subexpression), then *regexec*( ) shall still do the match, but shall record only the first
58374 *nmatch* substrings.

58375 When matching a basic or extended regular expression, any given parenthesized subexpression
58376 of *pattern* might participate in the match of several different substrings of *string*, or it might not
58377 match any substring even though the pattern as a whole did match. The following rules shall be
58378 used to determine which substrings to report in *pmatch* when matching regular expressions:

58379 1. If subexpression *i* in a regular expression is not contained within another subexpression,
58380 and it participated in the match several times, then the byte offsets in *pmatch*[*i*] shall
58381 delimit the last such match.

58382 2. If subexpression *i* is not contained within another subexpression, and it did not
58383 participate in an otherwise successful match, the byte offsets in *pmatch*[*i*] shall be −1. A
58384 subexpression does not participate in the match when:

58385 `'*'` or `"\{\}"` appears immediately after the subexpression in a basic regular
58386 expression, or `'*'`, `'?'`, or `"{}"` appears immediately after the subexpression in
58387 an extended regular expression, and the subexpression did not match (matched 0
58388 times)

58389 or:

58390 `'|'` is used in an extended regular expression to select this subexpression or
58391 another, and the other subexpression matched.

58392 3. If subexpression *i* is contained within another subexpression *j*, and *i* is not contained
58393 within any other subexpression that is contained within *j*, and a match of subexpression *j*
58394 is reported in *pmatch*[*j*], then the match or non-match of subexpression *i* reported in
58395 *pmatch*[*i*] shall be as described in 1. and 2. above, but within the substring reported in
58396 *pmatch*[*j*] rather than the whole string. The offsets in *pmatch*[*i*] are still relative to the start
58397 of *string*.

58398 4. If subexpression *i* is contained in subexpression *j*, and the byte offsets in *pmatch*[*j*] are −1,
58399 then the pointers in *pmatch*[*i*] shall also be −1.

58400 5. If subexpression *i* matched a zero-length string, then both byte offsets in *pmatch*[*i*] shall be
58401 the byte offset of the character or null terminator immediately following the zero-length
58402 string.

If, when *regexec*( ) is called, the locale is different from when the regular expression was compiled, the result is undefined.

If REG_NEWLINE is not set in *cflags*, then a <newline> in *pattern* or *string* shall be treated as an ordinary character. If REG_NEWLINE is set, then <newline> shall be treated as an ordinary character except as follows:

1. A <newline> in *string* shall not be matched by a <period> outside a bracket expression or by any form of a non-matching list (see XBD Chapter 9, on page 181).
2. A <circumflex> (`'^'`) in *pattern*, when used to specify expression anchoring (see XBD Section 9.3.8, on page 188), shall match the zero-length string immediately after a <newline> in *string*, regardless of the setting of REG_NOTBOL.
3. A <dollar-sign> (`'$'`) in *pattern*, when used to specify expression anchoring, shall match the zero-length string immediately before a <newline> in *string*, regardless of the setting of REG_NOTEOL.

The *regfree*( ) function frees any memory allocated by *regcomp*( ) associated with *preg*.

The following constants are defined as the minimum set of error return values, although other errors listed as implementation extensions in **<regex.h>** are possible:

REG_BADBR	Content of `"\{\}"` invalid: not a number, number too large, more than two numbers, first larger than second.
REG_BADPAT	Invalid regular expression.
REG_BADRPT	`'?'`, `'*'`, or `'+'` not preceded by valid regular expression.
REG_EBRACE	`"\{\}"` imbalance.
REG_EBRACK	`"[]"` imbalance.
REG_ECOLLATE	Invalid collating element referenced.
REG_ECTYPE	Invalid character class type referenced.
REG_EESCAPE	Trailing <backslash> character in pattern.
REG_EPAREN	`"\(\)"` or `"()"` imbalance.
REG_ERANGE	Invalid endpoint in range expression.
REG_ESPACE	Out of memory.
REG_ESUBREG	Number in `"\digit"` invalid or in error.
REG_NOMATCH	*regexec*( ) failed to match.

If more than one error occurs in processing a function call, any one of the possible constants may be returned, as the order of detection is unspecified.

The *regerror*( ) function provides a mapping from error codes returned by *regcomp*( ) and *regexec*( ) to unspecified printable strings. It generates a string corresponding to the value of the *errcode* argument, which the application shall ensure is the last non-zero value returned by *regcomp*( ) or *regexec*( ) with the given value of *preg*. If *errcode* is not such a value, the content of the generated string is unspecified.

If *preg* is a null pointer, but *errcode* is a value returned by a previous call to *regexec*( ) or *regcomp*( ), the *regerror*( ) still generates an error string corresponding to the value of *errcode*, but it might not be as detailed under some implementations.

If the *errbuf_size* argument is not 0, *regerror*( ) shall place the generated string into the buffer of size *errbuf_size* bytes pointed to by *errbuf*. If the string (including the terminating null) cannot fit in the buffer, *regerror*( ) shall truncate the string and null-terminate the result.

If *errbuf_size* is 0, *regerror*( ) shall ignore the *errbuf* argument, and return the size of the buffer needed to hold the generated string.

If the *preg* argument to *regexec*( ) or *regfree*( ) is not a compiled regular expression returned by *regcomp*( ), the result is undefined. A *preg* is no longer treated as a compiled regular expression after it is given to *regfree*( ).

RETURN VALUE

Upon successful completion, the *regcomp*( ) function shall return 0. Otherwise, it shall return an integer value indicating an error as described in **<regex.h>**, and the content of *preg* is undefined. If a code is returned, the interpretation shall be as given in **<regex.h>**.

If *regcomp*( ) detects an invalid RE, it may return REG_BADPAT, or it may return one of the error codes that more precisely describes the error.

Upon successful completion, the *regexec*( ) function shall return 0. Otherwise, it shall return REG_NOMATCH to indicate no match.

Upon successful completion, the *regerror*( ) function shall return the number of bytes needed to hold the entire generated string, including the null termination. If the return value is greater than *errbuf_size*, the string returned in the buffer pointed to by *errbuf* has been truncated.

The *regfree*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

```
#include <regex.h>

/*
 * Match string against the extended regular expression in
 * pattern, treating errors as no match.
 *
 * Return 1 for match, 0 for no match.
 */

int
match(const char *string, char *pattern)
{
    int    status;
    regex_t    re;

    if (regcomp(&re, pattern, REG_EXTENDED|REG_NOSUB) != 0) {
        return(0);      /* Report error. */
    }
    status = regexec(&re, string, (size_t) 0, NULL, 0);
    regfree(&re);
    if (status != 0) {
        return(0);      /* Report error. */
    }
    return(1);
}
```

The following demonstrates how the REG_NOTBOL flag could be used with *regexec*( ) to find all substrings in a line that match a pattern supplied by a user. (For simplicity of the example, very little error checking is done.)

```
(void) regcomp (&re, pattern, 0);
/* This call to regexec() finds the first match on the line. */
error = regexec (&re, &buffer[0], 1, &pm, 0);
while (error == 0) {  /* While matches found. */
    /* Substring found between pm.rm_so and pm.rm_eo. */
    /* This call to regexec() finds the next match. */
    error = regexec (&re, buffer + pm.rm_eo, 1, &pm, REG_NOTBOL);
}
```

APPLICATION USAGE

An application could use:

```
regerror(code,preg,(char *)NULL,(size_t)0)
```

to find out how big a buffer is needed for the generated string, *malloc*( ) a buffer to hold the string, and then call *regerror*( ) again to get the string. Alternatively, it could allocate a fixed, static buffer that is big enough to hold most strings, and then use *malloc*( ) to allocate a larger buffer if it finds that this is too small.

To match a pattern as described in XCU Section 2.13 (on page 2382), use the *fnmatch*( ) function.

RATIONALE

The *regexec*( ) function must fill in all *nmatch* elements of *pmatch*, where *nmatch* and *pmatch* are supplied by the application, even if some elements of *pmatch* do not correspond to subexpressions in *pattern*. The application developer should note that there is probably no reason for using a value of *nmatch* that is larger than *preg*–>*re_nsub*+1.

The REG_NEWLINE flag supports a use of RE matching that is needed in some applications like text editors. In such applications, the user supplies an RE asking the application to find a line that matches the given expression. An anchor in such an RE anchors at the beginning or end of any line. Such an application can pass a sequence of <newline>-separated lines to *regexec*( ) as a single long string and specify REG_NEWLINE to *regcomp*( ) to get the desired behavior. The application must ensure that there are no explicit <newline> characters in *pattern* if it wants to ensure that any match occurs entirely within a single line.

The REG_NEWLINE flag affects the behavior of *regexec*( ), but it is in the *cflags* parameter to *regcomp*( ) to allow flexibility of implementation. Some implementations will want to generate the same compiled RE in *regcomp*( ) regardless of the setting of REG_NEWLINE and have *regexec*( ) handle anchors differently based on the setting of the flag. Other implementations will generate different compiled REs based on the REG_NEWLINE.

The REG_ICASE flag supports the operations taken by the *grep* **–i** option and the historical implementations of *ex* and *vi*. Including this flag will make it easier for application code to be written that does the same thing as these utilities.

The substrings reported in *pmatch*[ ] are defined using offsets from the start of the string rather than pointers. This allows type-safe access to both constant and non-constant strings.

The type **regoff_t** is used for the elements of *pmatch*[ ] to ensure that the application can represent large arrays in memory (important for an application conforming to the Shell and Utilities volume of POSIX.1-2017).

The 1992 edition of this standard required **regoff_t** to be at least as wide as **off_t**, to facilitate future extensions in which the string to be searched is taken from a file. However, these future

extensions have not appeared. The requirement rules out popular implementations with 32-bit **regoff_t** and 64-bit **off_t**, so it has been removed.

The standard developers rejected the inclusion of a *regsub*( ) function that would be used to do substitutions for a matched RE. While such a routine would be useful to some applications, its utility would be much more limited than the matching function described here. Both RE parsing and substitution are possible to implement without support other than that required by the ISO C standard, but matching is much more complex than substituting. The only difficult part of substitution, given the information supplied by *regexec*( ), is finding the next character in a string when there can be multi-byte characters. That is a much larger issue, and one that needs a more general solution.

The *errno* variable has not been used for error returns to avoid filling the *errno* name space for this feature.

The interface is defined so that the matched substrings *rm_sp* and *rm_ep* are in a separate **regmatch_t** structure instead of in **regex_t**. This allows a single compiled RE to be used simultaneously in several contexts; in *main*( ) and a signal handler, perhaps, or in multiple threads of lightweight processes. (The *preg* argument to *regexec*( ) is declared with type **const**, so the implementation is not permitted to use the structure to store intermediate results.) It also allows an application to request an arbitrary number of substrings from an RE. The number of subexpressions in the RE is reported in *re_nsub* in *preg*. With this change to *regexec*( ), consideration was given to dropping the REG_NOSUB flag since the user can now specify this with a zero *nmatch* argument to *regexec*( ). However, keeping REG_NOSUB allows an implementation to use a different (perhaps more efficient) algorithm if it knows in *regcomp*( ) that no subexpressions need be reported. The implementation is only required to fill in *pmatch* if *nmatch* is not zero and if REG_NOSUB is not specified. Note that the **size_t** type, as defined in the ISO C standard, is unsigned, so the description of *regexec*( ) does not need to address negative values of *nmatch*.

REG_NOTBOL was added to allow an application to do repeated searches for the same pattern in a line. If the pattern contains a <circumflex> character that should match the beginning of a line, then the pattern should only match when matched against the beginning of the line. Without the REG_NOTBOL flag, the application could rewrite the expression for subsequent matches, but in the general case this would require parsing the expression. The need for REG_NOTEOL is not as clear; it was added for symmetry.

The addition of the *regerror*( ) function addresses the historical need for conforming application programs to have access to error information more than ``Function failed to compile/match your RE for unknown reasons''.

This interface provides for two different methods of dealing with error conditions. The specific error codes (REG_EBRACE, for example), defined in **<regex.h>**, allow an application to recover from an error if it is so able. Many applications, especially those that use patterns supplied by a user, will not try to deal with specific error cases, but will just use *regerror*( ) to obtain a human-readable error message to present to the user.

The *regerror*( ) function uses a scheme similar to *confstr*( ) to deal with the problem of allocating memory to hold the generated string. The scheme used by *strerror*( ) in the ISO C standard was considered unacceptable since it creates difficulties for multi-threaded applications.

The *preg* argument is provided to *regerror*( ) to allow an implementation to generate a more descriptive message than would be possible with *errcode* alone. An implementation might, for example, save the character offset of the offending character of the pattern in a field of *preg*, and then include that in the generated message string. The implementation may also ignore *preg*.

A REG_FILENAME flag was considered, but omitted. This flag caused *regexec*( ) to match patterns as described in XCU Section 2.13 (on page 2382) instead of REs. This service is now provided by the *fnmatch*( ) function.

Notice that there is a difference in philosophy between the ISO POSIX-2: 1993 standard and POSIX.1-2017 in how to handle a ``bad'' regular expression. The ISO POSIX-2: 1993 standard says that many bad constructs ``produce undefined results'', or that ``the interpretation is undefined''. POSIX.1-2017, however, says that the interpretation of such REs is unspecified. The term ``undefined'' means that the action by the application is an error, of similar severity to passing a bad pointer to a function.

The *regcomp*( ) and *regexec*( ) functions are required to accept any null-terminated string as the *pattern* argument. If the meaning of the string is ``undefined'', the behavior of the function is ``unspecified''. POSIX.1-2017 does not specify how the functions will interpret the pattern; they might return error codes, or they might do pattern matching in some completely unexpected way, but they should not do something like abort the process.

FUTURE DIRECTIONS

None.

XBD Chapter 9 (on page 181), **<regex.h>**, **<sys/types.h>**

XCU Section 2.13 (on page 2382)

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

Moved from POSIX2 C-language Binding to BASE.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

> The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The normative text is updated to avoid use of the term ``must'' for application requirements.

The REG_ENOSYS constant is removed.

The **restrict** keyword is added to the *regcomp*( ), *regerror*( ), and *regexec*( ) prototypes for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #134 is applied, clarifying that if more than one error occurs in processing a function call, any one of the possible constants may be returned.

SD5-XBD-ERN-60 is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0505 [305] is applied.

NAME

remainder, remainderf, remainderl — remainder function

SYNOPSIS

```
#include <math.h>

double remainder(double x, double y);
float remainderf(float x, float y);
long double remainderl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall return the floating-point remainder $r=x-ny$ when y is non-zero. The value n is the integral value nearest the exact value x/y. When $|n-x/y| = \frac{1}{2}$, the value n is chosen to be even.

The behavior of *remainder*( ) shall be independent of the rounding mode.

RETURN VALUE

Upon successful completion, these functions shall return the floating-point remainder $r=x-ny$ when y is non-zero.

On systems that do not support the IEC 60559 Floating-Point option, if y is zero, it is implementation-defined whether a domain error occurs or zero is returned.

MX If x or y is NaN, a NaN shall be returned.

If x is infinite or y is 0 and the other is non-NaN, a domain error shall occur, and a NaN shall be returned.

ERRORS

These functions shall fail if:

MX Domain Error — The x argument is ±Inf, or the y argument is ±0 and the other argument is non-NaN.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Domain Error — The y argument is zero.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The *remainder*( ) function is no longer marked as an extension.

The *remainderf*( ) and *remainderl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

Issue 7

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #55 (SD5-XSH-ERN-82) is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0506 [320] is applied.

NAME

remove — remove a file

SYNOPSIS

```
#include <stdio.h>

int remove(const char *path);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *remove*( ) function shall cause the file named by the pathname pointed to by *path* to be no longer accessible by that name. A subsequent attempt to open that file using that name shall fail, unless it is created anew.

CX If *path* does not name a directory, *remove*(*path*) shall be equivalent to *unlink*(*path*).

If *path* names a directory, *remove*(*path*) shall be equivalent to *rmdir*(*path*).

RETURN VALUE

CX Refer to *rmdir*( ) or *unlink*( ).

ERRORS

CX Refer to *rmdir*( ) or *unlink*( ).

EXAMPLES

Removing Access to a File

The following example shows how to remove access to a file named **/home/cnd/old_mods**.

```
#include <stdio.h>

int status;
...
status = remove("/home/cnd/old_mods");
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD **<stdio.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ISO C standard.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION, RETURN VALUE, and ERRORS sections are updated so that if *path* is not a directory, *remove*( ) is equivalent to *unlink*( ), and if it is a directory, it is equivalent to *rmdir*( ).

NAME

remque — remove an element from a queue

SYNOPSIS

XSI

```
#include <search.h>

void remque(void *element);
```

DESCRIPTION

Refer to *insque( )*.

NAME

remquo, remquof, remquol — remainder functions

SYNOPSIS

```
#include <math.h>

double remquo(double x, double y, int *quo);
float remquof(float x, float y, int *quo);
long double remquol(long double x, long double y, int *quo);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *remquo*( ), *remquof*( ), and *remquol*( ) functions shall compute the same remainder as the *remainder*( ), *remainderf*( ), and *remainderl*( ) functions, respectively. In the object pointed to by *quo*, they store a value whose sign is the sign of x/y and whose magnitude is congruent modulo 2^n to the magnitude of the integral quotient of x/y, where n is an implementation-defined integer greater than or equal to 3. If y is zero, the value stored in the object pointed to by *quo* is unspecified.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

These functions shall return x REM y.

On systems that do not support the IEC 60559 Floating-Point option, if y is zero, it is implementation-defined whether a domain error occurs or zero is returned.

MX If x or y is NaN, a NaN shall be returned.

If x is ±Inf or y is zero and the other argument is non-NaN, a domain error shall occur, and a NaN shall be returned.

ERRORS

These functions shall fail if:

MX

Domain Error	The x argument is ±Inf, or the y argument is ±0 and the other argument is non-NaN. If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Domain Error	The y argument is zero. If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions are intended for implementing argument reductions which can exploit a few low-order bits of the quotient. Note that *x* may be so large in magnitude relative to *y* that an exact representation of the quotient is not practical.

FUTURE DIRECTIONS

None.

Issue 7

ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #56 (SD5-XSH-ERN-83) is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0507 [320] is applied.

NAME

rename, renameat — rename file

SYNOPSIS

```
#include <stdio.h>

int rename(const char *old, const char *new);
```

OH CX
```
#include <fcntl.h>
```

CX
```
int renameat(int oldfd, const char *old, int newfd,
    const char *new);
```

DESCRIPTION

CX For *rename*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *rename*( ) function shall change the name of a file. The *old* argument points to the pathname CX of the file to be renamed. The *new* argument points to the new pathname of the file. If the *new* argument does not resolve to an existing directory entry for a file of type directory and the *new* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters after all symbolic links have been processed, *rename*( ) shall fail.

If either the *old* or *new* argument names a symbolic link, *rename*( ) shall operate on the symbolic link itself, and shall not resolve the last component of the argument. If the *old* argument and the *new* argument resolve to either the same existing directory entry or different directory entries for the same existing file, *rename*( ) shall return successfully and perform no other action.

If the *old* argument points to the pathname of a file that is not a directory, the *new* argument shall not point to the pathname of a directory. If the link named by the *new* argument exists, it shall be removed and *old* renamed to *new*. In this case, a link named *new* shall remain visible to other threads throughout the renaming operation and refer either to the file referred to by *new* or *old* before the operation began. Write access permission is required for both the directory containing *old* and the directory containing *new*.

If the *old* argument points to the pathname of a directory, the *new* argument shall not point to the pathname of a file that is not a directory. If the directory named by the *new* argument exists, it shall be removed and *old* renamed to *new*. In this case, a link named *new* shall exist throughout the renaming operation and shall refer either to the directory referred to by *new* or *old* before the operation began. If *new* names an existing directory, it shall be required to be an empty directory.

If either *pathname* argument refers to a path whose final component is either dot or dot-dot, *rename*( ) shall fail.

If the *old* argument points to a pathname of a symbolic link, the symbolic link shall be renamed. If the *new* argument points to a pathname of a symbolic link, the symbolic link shall be removed.

The *old* pathname shall not name an ancestor directory of the *new* pathname. Write access permission is required for the directory containing *old* and the directory containing *new*. If the *old* argument points to the pathname of a directory, write access permission may be required for the directory named by *old*, and, if it exists, the directory named by *new*.

If the link named by the *new* argument exists and the file's link count becomes 0 when it is removed and no process has the file open, the space occupied by the file shall be freed and the file shall no longer be accessible. If one or more processes have the file open when the last link is removed, the link shall be removed before *rename*( ) returns, but the removal of the file contents shall be postponed until all references to the file are closed.

Upon successful completion, *rename*( ) shall mark for update the last data modification and last file status change timestamps of the parent directory of each file.

If the *rename*( ) function fails for any reason other than [EIO], any file named by *new* shall be unaffected.

The *renameat*( ) function shall be equivalent to the *rename*( ) function except in the case where either *old* or *new* specifies a relative path. If *old* is a relative path, the file to be renamed is located relative to the directory associated with the file descriptor *oldfd* instead of the current working directory. If *new* is a relative path, the same happens only relative to the directory associated with *newfd*. If the access mode of the open file description associated with the file descriptor is not O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the access mode is O_SEARCH, the function shall not perform the check.

If *renameat*( ) is passed the special value AT_FDCWD in the *oldfd* or *newfd* parameter, the current working directory shall be used in the determination of the file for the respective *path* parameter.

RETURN VALUE

CX Upon successful completion, the *rename*( ) function shall return 0. Otherwise, it shall return –1, *errno* shall be set to indicate the error, and neither the file named by *old* nor the file named by *new* shall be changed or created.

CX Upon successful completion, the *renameat*( ) function shall return 0. Otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

CX The *rename*( ) and *renameat*( ) functions shall fail if:

CX [EACCES] A component of either path prefix denies search permission; or one of the directories containing *old* or *new* denies write permissions; or, write permission is required and is denied for a directory pointed to by the *old* or *new* arguments.

CX [EBUSY] The directory named by *old* or *new* is currently in use by the system or another process, and the implementation considers this an error.

CX [EEXIST] or [ENOTEMPTY]
The link named by *new* is a directory that is not an empty directory.

CX [EINVAL] The *old* pathname names an ancestor directory of the *new* pathname, or either pathname argument contains a final component that is dot or dot-dot.

CX [EIO] A physical I/O error has occurred.

CX [EISDIR] The *new* argument points to a directory and the *old* argument points to a file that is not a directory.

CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

CX [EMLINK] The file named by *old* is a directory, and the link count of the parent directory of *new* would exceed {LINK_MAX}.

CX [ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

CX [ENOENT] The link named by *old* does not name an existing file, a component of the path prefix of *new* does not exist, or either *old* or *new* points to an empty string.

CX [ENOSPC] The directory that would contain *new* cannot be extended.

CX [ENOTDIR] A component of either path prefix names an existing file that is neither a directory nor a symbolic link to a directory; or the *old* argument names a directory and the *new* argument names a non-directory file; or the *old* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory; or the *old* argument names an existing non-directory file and the *new* argument names a nonexistent file, contains at least one non-<slash> character, and ends with one or more trailing <slash> characters; or the *new* argument names an existing non-directory file, contains at least one non-<slash> character, and ends with one or more trailing <slash> characters.

XSI [EPERM] or [EACCES]
The S_ISVTX flag is set on the directory containing the file referred to by *old* and the process does not satisfy the criteria specified in XBD Section 4.3 (on page 108) with respect to *old*; or *new* refers to an existing file, the S_ISVTX flag is set on the directory containing this file, and the process does not satisfy the criteria specified in XBD Section 4.3 with respect to this file.

CX [EROFS] The requested operation requires writing in a directory on a read-only file system.

CX [EXDEV] The links named by *new* and *old* are on different file systems and the implementation does not support links between file systems.

CX In addition, the *renameat( )* function shall fail if:

[EACCES] The access mode of the open file description associated with *oldfd* or *newfd* is not O_SEARCH and the permissions of the directory underlying *oldfd* or *newfd*, respectively, do not permit directory searches.

[EBADF] The *old* argument does not specify an absolute path and the *oldfd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching, or the *new* argument does not specify an absolute path and the *newfd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

[ENOTDIR] The *old* or *new* argument is not an absolute path and *oldfd* or *newfd*, respectively, is a file descriptor associated with a non-directory file.

CX The *rename( )* and *renameat( )* functions may fail if:

OB XSR [EBUSY] The file named by the *old* or *new* arguments is a named STREAM.

CX [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

CX [ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

58926 CX [ETXTBSY] The file named by *new* exists and is the last directory entry to a pure procedure
58927 (shared text) file that is being executed.

58928 **EXAMPLES**

58929 **Renaming a File**

58930 The following example shows how to rename a file named **/home/cnd/mod1** to
58931 **/home/cnd/mod2**.

58932
```
#include <stdio.h>
```

58933
```
int status;
```
58934
```
...
```
58935
```
status = rename("/home/cnd/mod1", "/home/cnd/mod2");
```

58936 **APPLICATION USAGE**

58937 Some implementations mark for update the last file status change timestamp of renamed files
58938 and some do not. Applications which make use of the last file status change timestamp may
58939 behave differently with respect to renamed files unless they are designed to allow for either
58940 behavior.

58941 **RATIONALE**

58942 This *rename*( ) function is equivalent for regular files to that defined by the ISO C standard. Its
58943 inclusion here expands that definition to include actions on directories and specifies behavior
58944 when the *new* parameter names a file that already exists. That specification requires that the
58945 action of the function be atomic.

58946 One of the reasons for introducing this function was to have a means of renaming directories
58947 while permitting implementations to prohibit the use of *link*( ) and *unlink*( ) with directories,
58948 thus constraining links to directories to those made by *mkdir*( ).

58949 The specification that if *old* and *new* refer to the same file is intended to guarantee that:

58950
```
rename("x", "x");
```

58951 does not remove the file.

58952 Renaming dot or dot-dot is prohibited in order to prevent cyclical file system paths.

58953 See also the descriptions of [ENOTEMPTY] and [ENAMETOOLONG] in *rmdir*( ) and [EBUSY] in
58954 *unlink*( ). For a discussion of [EXDEV], see *link*( ).

58955 The purpose of the *renameat*( ) function is to rename files in directories other than the current
58956 working directory without exposure to race conditions. Any part of the path of a file could be
58957 changed in parallel to a call to *rename*( ), resulting in unspecified behavior. By opening file
58958 descriptors for the source and target directories and using the *renameat*( ) function it can be
58959 guaranteed that that renamed file is located correctly and the resulting file is in the desired
58960 directory.

58961 **FUTURE DIRECTIONS**

58962 None.

58963 **SEE ALSO**

58964 *link*( ), *rmdir*( ), *symlink*( ), *unlink*( )

58965 XBD Section 4.3 (on page 108), **<fcntl.h>**, **<stdio.h>**

58966 **CHANGE HISTORY**

58967 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

58968 **Issue 5**

58969 The [EBUSY] error is added to the optional part of the ERRORS section.

58970 **Issue 6**

58971 Extensions beyond the ISO C standard are marked.

58972 The following new requirements on POSIX implementations derive from alignment with the
58973 Single UNIX Specification:

58974 The [EIO] mandatory error condition is added.

58975 The [ELOOP] mandatory error condition is added.

58976 A second [ENAMETOOLONG] is added as an optional error condition.

58977 The [ETXTBSY] optional error condition is added.

58978 The following changes were made to align with the IEEE P1003.1a draft standard:

58979 Details are added regarding the treatment of symbolic links.

58980 The [ELOOP] optional error condition is added.

58981 The normative text is updated to avoid use of the term ``must'' for application requirements.

58982 **Issue 7**

58983 Austin Group Interpretation 1003.1-2001 #016 is applied, changing the definition of the
58984 [ENOTDIR] error.

58985 Austin Group Interpretation 1003.1-2001 #076 is applied, clarifying the behavior if the final
58986 component of a path is either dot or dot-dot, and adding the associated [EINVAL] error case.

58987 Austin Group Interpretation 1003.1-2001 #143 is applied.

58988 Austin Group Interpretation 1003.1-2001 #145 is applied, clarifying that the [ENOENT] error
58989 condition also applies to the case in which a component of *new* does not exist.

58990 Austin Group Interpretations 1003.1-2001 #174 and #181 are applied.

58991 The *renameat*( ) function is added from The Open Group Technical Standard, 2006, Extended API
58992 Set Part 2.

58993 Changes are made related to support for finegrained timestamps.

58994 Changes are made to allow a directory to be opened for searching.

58995 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0508 [324], XSH/TC1-2008/0509 [147],
58996 XSH/TC1-2008/0510 [379], XSH/TC1-2008/0511 [278], and XSH/TC1-2008/0512 [278] are
58997 applied.

58999 XSH/TC2-2008/0313 [716], XSH/TC2-2008/0314 [817], XSH/TC2-2008/0315 [817], and
59000 XSH/TC2-2008/0316 [591] are applied.

NAME

rewind — reset the file position indicator in a stream

SYNOPSIS

```
#include <stdio.h>

void rewind(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The call:

```
rewind(stream)
```

shall be equivalent to:

```
(void) fseek(stream, 0L, SEEK_SET)
```

except that *rewind*( ) shall also clear the error indicator.

CX Since *rewind*( ) does not return a value, an application wishing to detect errors should clear *errno*, then call *rewind*( ), and if *errno* is non-zero, assume an error has occurred.

RETURN VALUE

The *rewind*( ) function shall not return a value.

ERRORS

CX Refer to *fseek*( ) with the exception of [EINVAL] which does not apply.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0513 [14] is applied.

NAME

rewinddir — reset the position of a directory stream to the beginning of a directory

SYNOPSIS

```
#include <dirent.h>

void rewinddir(DIR *dirp);
```

DESCRIPTION

The *rewinddir*( ) function shall reset the position of the directory stream to which *dirp* refers to the beginning of the directory. It shall also cause the directory stream to refer to the current state of the corresponding directory, as a call to *opendir*( ) would have done. If *dirp* does not refer to a directory stream, the effect is undefined.

After a call to the *fork*( ) function, either the parent or child (but not both) may continue XSI processing the directory stream using *readdir*( ), *rewinddir*( ), or *seekdir*( ). If both the parent and child processes use these functions, the result is undefined.

RETURN VALUE

The *rewinddir*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *rewinddir*( ) function should be used in conjunction with *opendir*( ), *readdir*( ), and *closedir*( ) to examine the contents of the directory. This method is recommended for portability.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

closedir( ), *fdopendir*( ), *readdir*( )

XBD **<dirent.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 2.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

> The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

NAME

rint, rintf, rintl — round-to-nearest integral value

SYNOPSIS

```
#include <math.h>

double rint(double x);
float rintf(float x);
long double rintl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall return the integral value (represented as a **double**) nearest *x* in the direction of the current rounding mode. The current rounding mode is implementation-defined.

If the current rounding mode rounds toward negative infinity, then *rint*( ) shall be equivalent to *floor*( ). If the current rounding mode rounds toward positive infinity, then *rint*( ) shall be equivalent to *ceil*( ). If the current rounding mode rounds towards zero, then *rint*( ) shall be
MX equivalent to *trunc*( ). If the current rounding mode rounds towards nearest, then *rint*( ) differs from *round*( ) in that halfway cases are rounded to even rather than away from zero.

These functions differ from the *nearbyint*( ), *nearbyintf*( ), and *nearbyintl*( ) functions only in that they may raise the inexact floating-point exception if the result differs in value from the argument.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the integer (represented as a double
MX precision number) nearest *x* in the direction of the current rounding mode. The result shall have the same sign as *x*.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0 or ±Inf, *x* shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The integral value returned by these functions need not be expressible as an **intmax_t**. The return value should be tested before assigning it to an integer type to avoid the undefined results of an integer overflow.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.20 (on page 117), **<math.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

The *rintf*( ) and *rintl*( ) functions are added.

The *rint*( ) function is no longer marked as an extension.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0514 [346], XSH/TC1-2008/0515 [346], XSH/TC1-2008/0516 [346], XSH/TC1-2008/0517 [346], and XSH/TC1-2008/0518 [346] are applied.

59138 **NAME**

59139 rmdir — remove a directory

59140 **SYNOPSIS**

59141 `#include <unistd.h>`

59142 `int rmdir(const char *path);`

59143 **DESCRIPTION**

59144 The *rmdir*( ) function shall remove a directory whose name is given by *path*. The directory shall
59145 be removed only if it is an empty directory.

59146 If the directory is the root directory or the current working directory of any process, it is
59147 unspecified whether the function succeeds, or whether it shall fail and set *errno* to [EBUSY].

59148 If *path* names a symbolic link, then *rmdir*( ) shall fail and set *errno* to [ENOTDIR].

59149 If the *path* argument refers to a path whose final component is either dot or dot-dot, *rmdir*( ) shall
59150 fail.

59151 If the directory's link count becomes 0 and no process has the directory open, the space occupied
59152 by the directory shall be freed and the directory shall no longer be accessible. If one or more
59153 processes have the directory open when the last link is removed, the dot and dot-dot entries, if
59154 present, shall be removed before *rmdir*( ) returns and no new entries may be created in the
59155 directory, but the directory shall not be removed until all references to the directory are closed.

59156 If the directory is not an empty directory, *rmdir*( ) shall fail and set *errno* to [EEXIST] or
59157 [ENOTEMPTY].

59158 Upon successful completion, *rmdir*( ) shall mark for update the last data modification and last
59159 file status change timestamps of the parent directory.

59160 **RETURN VALUE**

59161 Upon successful completion, the function *rmdir*( ) shall return 0. Otherwise, –1 shall be returned,
59162 and *errno* set to indicate the error. If –1 is returned, the named directory shall not be changed.

59163 **ERRORS**

59164 The *rmdir*( ) function shall fail if:

59165 [EACCES] Search permission is denied on a component of the path prefix, or write
59166 permission is denied on the parent directory of the directory to be removed.

59167 [EBUSY] The directory to be removed is currently in use by the system or some process
59168 and the implementation considers this to be an error.

59169 [EEXIST] or [ENOTEMPTY]
59170 The *path* argument names a directory that is not an empty directory, or there
59171 are hard links to the directory other than dot or a single entry in dot-dot.

59172 [EINVAL] The *path* argument contains a last component that is dot.

59173 [EIO] A physical I/O error has occurred.

59174 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
59175 argument.

59176 [ENAMETOOLONG]
59177 The length of a component of a pathname is longer than {NAME_MAX}.

59178 [ENOENT] A component of *path* does not name an existing file, or the *path* argument
59179 names a nonexistent directory or points to an empty string.

59180 [ENOTDIR] A component of *path* names an existing file that is neither a directory nor a
59181 symbolic link to a directory.

59182 XSI [EPERM] or [EACCES]
59183 The S_ISVTX flag is set on the directory containing the file referred to by the
59184 *path* argument and the process does not satisfy the criteria specified in XBD
59185 Section 4.3 (on page 108).

59186 [EROFS] The directory entry to be removed resides on a read-only file system.

59187 The *rmdir*( ) function may fail if:

59188 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
59189 resolution of the *path* argument.

59190 [ENAMETOOLONG]
59191 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
59192 symbolic link produced an intermediate result with a length that exceeds
59193 {PATH_MAX}.

59194 **EXAMPLES**

59195 **Removing a Directory**

59196 The following example shows how to remove a directory named **/home/cnd/mod1**.

59197
```
#include <unistd.h>
```

59198
```
int status;
```
59199
```
...
```
59200
```
status = rmdir("/home/cnd/mod1");
```

59201 **APPLICATION USAGE**
59202 None.

59203 **RATIONALE**
59204 The *rmdir*( ) and *rename*( ) functions originated in 4.2 BSD, and they used [ENOTEMPTY] for the
59205 condition when the directory to be removed does not exist or *new* already exists. When the 1984
59206 /usr/group standard was published, it contained [EEXIST] instead. When these functions were
59207 adopted into System V, the 1984 /usr/group standard was used as a reference. Therefore,
59208 several existing applications and implementations support/use both forms, and no agreement
59209 could be reached on either value. All implementations are required to supply both [EEXIST] and
59210 [ENOTEMPTY] in **<errno.h>** with distinct values, so that applications can use both values in C-
59211 language **case** statements.

59212 The meaning of deleting *pathname***/dot** is unclear, because the name of the file (directory) in the
59213 parent directory to be removed is not clear, particularly in the presence of multiple links to a
59214 directory.

59215 The POSIX.1-1990 standard was silent with regard to the behavior of *rmdir*( ) when there are
59216 multiple hard links to the directory being removed. The requirement to set *errno* to [EEXIST] or
59217 [ENOTEMPTY] clarifies the behavior in this case.

59218 If the current working directory of the process is being removed, that should be an allowed
59219 error.

59220 Virtually all existing implementations detect [ENOTEMPTY] or the case of dot-dot. The text in
59221 Section 2.3 (on page 481) about returning any one of the possible errors permits that behavior to
59222 continue. The [ELOOP] error may be returned if more than {SYMLOOP_MAX} symbolic links

are encountered during resolution of the *path* argument.

FUTURE DIRECTIONS

None.

XBD Section 4.3 (on page 108), **<unistd.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to indicate the results of naming a symbolic link in *path*.
- The [EIO] mandatory error condition is added.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

Austin Group Interpretation 1003.1-2001 #181 is applied, updating the requirements for operations when the S_ISVTX bit is set.

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0519 [324] is applied.

NAME

round, roundf, roundl — round to the nearest integer value in a floating-point format

SYNOPSIS

```
#include <math.h>

double round(double x);
float roundf(float x);
long double roundl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall round their argument to the nearest integer value in floating-point format, rounding halfway cases away from zero, regardless of the current rounding direction.

RETURN VALUE

MX Upon successful completion, these functions shall return the rounded integer value. The result shall have the same sign as *x*.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0 or ±Inf, *x* shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The integral value returned by these functions need not be expressible as an **intmax_t**. The return value should be tested before assigning it to an integer type to avoid the undefined results of an integer overflow.

These functions may raise the inexact floating-point exception if the result differs in value from the argument.

RATIONALE

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0520 [346] is applied.

NAME

scalbln, scalblnf, scalblnl, scalbn, scalbnf, scalbnl — compute exponent using FLT_RADIX

SYNOPSIS

```
#include <math.h>

double scalbln(double x, long n);
float scalblnf(float x, long n);
long double scalblnl(long double x, long n);
double scalbn(double x, int n);
float scalbnf(float x, int n);
long double scalbnl(long double x, int n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall compute $x * \text{FLT\_RADIX}^n$ efficiently, not normally by computing FLT_RADIX^n explicitly.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return $x * \text{FLT\_RADIX}^n$.

If the result would cause overflow, a range error shall occur and these functions shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (according to the sign of *x*) as appropriate for the return type of the function.

MXX If the correct value would cause underflow, and is not representable, a range error may occur, and *scalbln*( ), *scalblnf*( ), *scalblnl*( ), *scalbn*( ), *scalbnf*( ), and *scalbnl*( ) shall return 0.0, or (if IEC 60559 Floating-Point is not supported) an implementation-defined value no greater in magnitude than DBL_MIN, FLT_MIN, LDBL_MIN, DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0 or ±Inf, *x* shall be returned.

If *n* is 0, *x* shall be returned.

MXX If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions shall fail if:

Range Error The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions are named so as to avoid conflicting with the historical definition of the *scalb*( ) function from the Single UNIX Specification. The difference is that the *scalb*( ) function has a second argument of **double** instead of **int**. The *scalb*( ) function is not part of the ISO C standard. The three functions whose second type is **long** are provided because the factor required to scale from the smallest positive floating-point value to the largest finite one, on many implementations, is too large to represent in the minimum-width **int** format.

FUTURE DIRECTIONS

None.

59369 **DESCRIPTION**

59370 Refer to *fscanf( )*.

NAME

sched_get_priority_max, sched_get_priority_min ‡'get priority limits'(**REALTIME**)

SYNOPSIS

PS|TPS
```
#include <sched.h>

int sched_get_priority_max(int policy);
int sched_get_priority_min(int policy);
```

DESCRIPTION

The *sched_get_priority_max*( ) and *sched_get_priority_min*( ) functions shall return the appropriate maximum or minimum, respectively, for the scheduling policy specified by *policy*.

The value of *policy* shall be one of the scheduling policy values defined in **<sched.h>**.

RETURN VALUE

If successful, the *sched_get_priority_max*( ) and *sched_get_priority_min*( ) functions shall return the appropriate maximum or minimum values, respectively. If unsuccessful, they shall return a value of –1 and set *errno* to indicate the error.

ERRORS

The *sched_get_priority_max*( ) and *sched_get_priority_min*( ) functions shall fail if:

[EINVAL] The value of the *policy* parameter does not represent a defined scheduling policy.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

These functions are marked as part of the Process Scheduling option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Process Scheduling option.

The [ESRCH] error condition has been removed since these functions do not take a *pid* argument.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/52 is applied, changing the PS margin code in the SYNOPSIS to PS|TPS.

NAME

sched_getparam ‡’get scheduling parameters (**REALTIME**)

SYNOPSIS

PS

```
#include <sched.h>

int sched_getparam(pid_t pid, struct sched_param *param);
```

DESCRIPTION

The *sched_getparam*( ) function shall return the scheduling parameters of a process specified by *pid* in the **sched_param** structure pointed to by *param*.

If a process specified by *pid* exists, and if the calling process has permission, the scheduling parameters for the process whose process ID is equal to *pid* shall be returned.

If *pid* is zero, the scheduling parameters for the calling process shall be returned. The behavior of the *sched_getparam*( ) function is unspecified if the value of *pid* is negative.

RETURN VALUE

Upon successful completion, the *sched_getparam*( ) function shall return zero. If the call to *sched_getparam*( ) is unsuccessful, the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *sched_getparam*( ) function shall fail if:

[EPERM] The requesting process does not have permission to obtain the scheduling parameters of the specified process.

[ESRCH] No process can be found corresponding to that specified by *pid*.

EXAMPLES

NAME

sched_getscheduler ‡'get scheduling policy (**REALTIME**)

SYNOPSIS

PS
```
#include <sched.h>

int sched_getscheduler(pid_t pid);
```

DESCRIPTION

The *sched_getscheduler*( ) function shall return the scheduling policy of the process specified by *pid*. If the value of *pid* is negative, the behavior of the *sched_getscheduler*( ) function is unspecified.

The values that can be returned by *sched_getscheduler*( ) are defined in the **<sched.h>** header.

If a process specified by *pid* exists, and if the calling process has permission, the scheduling policy shall be returned for the process whose process ID is equal to *pid*.

If *pid* is zero, the scheduling policy shall be returned for the calling process.

RETURN VALUE

Upon successful completion, the *sched_getscheduler*( ) function shall return the scheduling policy of the specified process. If unsuccessful, the function shall return −1 and set *errno* to indicate the error.

ERRORS

The *sched_getscheduler*( ) function shall fail if:

[EPERM] The requesting process does not have permission to determine the scheduling policy of the specified process.

[ESRCH] No process can be found corresponding to that specified by *pid*.

NAME

sched_rr_get_interval ‡’get execution time limits (**REALTIME**)

SYNOPSIS

PS|TPS

```
#include <sched.h>

int sched_rr_get_interval(pid_t pid, struct timespec *interval);
```

DESCRIPTION

The *sched_rr_get_interval*( ) function shall update the **timespec** structure referenced by the *interval* argument to contain the current execution time limit (that is, time quantum) for the process specified by *pid*. If *pid* is zero, the current execution time limit for the calling process shall be returned.

RETURN VALUE

If successful, the *sched_rr_get_interval*( ) function shall return zero. Otherwise, it shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *sched_rr_get_interval*( ) function shall fail if:

[ESRCH] No process can be found corresponding to that specified by *pid*.

NAME

sched_setparam ‡’set scheduling parameters(**REALTIME**)

SYNOPSIS

PS

```
#include <sched.h>

int sched_setparam(pid_t pid, const struct sched_param *param);
```

DESCRIPTION

The *sched_setparam*( ) function shall set the scheduling parameters of the process specified by *pid* to the values specified by the **sched_param** structure pointed to by *param*. The value of the *sched_priority* member in the **sched_param** structure shall be any integer within the inclusive priority range for the current scheduling policy of the process specified by *pid*. Higher numerical values for the priority represent higher priorities. If the value of *pid* is negative, the behavior of the *sched_setparam*( ) function is unspecified.

If a process specified by *pid* exists, and if the calling process has permission, the scheduling parameters shall be set for the process whose process ID is equal to *pid*.

If *pid* is zero, the scheduling parameters shall be set for the calling process.

The conditions under which one process has permission to change the scheduling parameters of another process are implementation-defined.

Implementations may require the requesting process to have appropriate privileges to set its own scheduling parameters or those of another process.

See Scheduling Policies (on page 506) for a description on how this function affects the scheduling of the threads within the target process.

SS If the current scheduling policy for the target process is not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC, the result is implementation-defined; this case includes the SCHED_OTHER policy.

SS The specified *sched_ss_repl_period* shall be greater than or equal to the specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail.

The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

This function is not atomic with respect to other threads in the process. Threads may continue to execute while this function call is in the process of changing the scheduling policy for the underlying kernel-scheduled entities used by the process contention scope threads.

RETURN VALUE

If successful, the *sched_setparam*( ) function shall return zero.

If the call to *sched_setparam*( ) is unsuccessful, the priority shall remain unchanged, and the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *sched_setparam*( ) function shall fail if:

[EINVAL] One or more of the requested scheduling parameters is outside the range defined for the scheduling policy of the specified *pid*.

[EPERM] The requesting process does not have permission to set the scheduling parameters for the specified process, or does not have appropriate privileges to invoke *sched_setparam*( ).

[ESRCH] No process can be found corresponding to that specified by *pid*.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *sched_setparam*( ) function is marked as part of the Process Scheduling option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Process Scheduling option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is added.
- Sections describing two-level scheduling and atomicity of the function are added.

The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #100 is applied.

Issue 7

Austin Group Interpretation 1003.1-2001 #061 is applied, updating the DESCRIPTION.

Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements for the *sched_ss_repl_period* and *sched_ss_init_budget* values.

NAME

sched_setscheduler ‡’set scheduling policy and parameters (**REALTIME**)

SYNOPSIS

PS
```
#include <sched.h>

int sched_setscheduler(pid_t pid, int policy,
    const struct sched_param *param);
```

DESCRIPTION

The *sched_setscheduler*( ) function shall set the scheduling policy and scheduling parameters of the process specified by *pid* to *policy* and the parameters specified in the **sched_param** structure pointed to by *param*, respectively. The value of the *sched_priority* member in the **sched_param** structure shall be any integer within the inclusive priority range for the scheduling policy specified by *policy*. If the value of *pid* is negative, the behavior of the *sched_setscheduler*( ) function is unspecified.

The possible values for the *policy* parameter are defined in the **<sched.h>** header.

If a process specified by *pid* exists, and if the calling process has permission, the scheduling policy and scheduling parameters shall be set for the process whose process ID is equal to *pid*.

If *pid* is zero, the scheduling policy and scheduling parameters shall be set for the calling process.

The conditions under which one process has appropriate privileges to change the scheduling parameters of another process are implementation-defined.

Implementations may require that the requesting process have permission to set its own scheduling parameters or those of another process. Additionally, implementation-defined restrictions may apply as to the appropriate privileges required to set the scheduling policy of the process, or the scheduling policy of another process, to a particular value.

The *sched_setscheduler*( ) function shall be considered successful if it succeeds in setting the scheduling policy and scheduling parameters of the process specified by *pid* to the values specified by *policy* and the structure pointed to by *param*, respectively.

See Scheduling Policies (on page 506) for a description on how this function affects the scheduling of the threads within the target process.

SS If the current scheduling policy for the target process is not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC, the result is implementation-defined; this case includes the SCHED_OTHER policy.

SS The specified *sched_ss_repl_period* shall be greater than or equal to the specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail.

The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

This function is not atomic with respect to other threads in the process. Threads may continue to execute while this function call is in the process of changing the scheduling policy and associated scheduling parameters for the underlying kernel-scheduled entities used by the process contention scope threads.

RETURN VALUE

Upon successful completion, the function shall return the former scheduling policy of the specified process. If the *sched_setscheduler*( ) function fails to complete successfully, the policy and scheduling parameters shall remain unchanged, and the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *sched_setscheduler*( ) function shall fail if:

[EINVAL] The value of the *policy* parameter is invalid, or one or more of the parameters contained in *param* is outside the valid range for the specified scheduling policy.

[EPERM] The requesting process does not have permission to set either or both of the scheduling parameters or the scheduling policy of the specified process.

[ESRCH] No process can be found corresponding to that specified by *pid*.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

NAME

sched_yield — yield the processor

SYNOPSIS

```
#include <sched.h>

int sched_yield(void);
```

DESCRIPTION

The *sched_yield*( ) function shall force the running thread to relinquish the processor until it again becomes the head of its thread list. It takes no arguments.

RETURN VALUE

The *sched_yield*( ) function shall return 0 if it completes successfully; otherwise, it shall return a value of –1 and set *errno* to indicate the error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The conceptual model for scheduling semantics in POSIX.1-2017 defines a set of thread lists. This set of thread lists is always present regardless of the scheduling options supported by the system. On a system where the Process Scheduling option is not supported, portable applications should not make any assumptions regarding whether threads from other processes will be on the same thread list.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6

The *sched_yield*( ) function is now marked as part of the Process Scheduling and Threads options.

Issue 7

SD5-XSH-ERN-120 is applied, adding APPLICATION USAGE.

The *sched_yield*( ) function is moved to the Base.

NAME

seed48 ‡'seed a uniformly distributed pseudo-random non-negative long integer generator

SYNOPSIS

XSI

```
#include <stdlib.h>

unsigned short *seed48(unsigned short seed16v[3]);
```

DESCRIPTION

Refer to *drand48( )*.

NAME

seekdir — set the position of a directory stream

SYNOPSIS

XSI
```
#include <dirent.h>

void seekdir(DIR *dirp, long loc);
```

DESCRIPTION

The *seekdir*( ) function shall set the position of the next *readdir*( ) operation on the directory stream specified by *dirp* to the position specified by *loc*. The value of *loc* should have been returned from an earlier call to *telldir*( ) using the same directory stream. The new position reverts to the one associated with the directory stream when *telldir*( ) was performed.

If the value of *loc* was not obtained from an earlier call to *telldir*( ), or if a call to *rewinddir*( ) occurred between the call to *telldir*( ) and the call to *seekdir*( ), the results of subsequent calls to *readdir*( ) are unspecified.

RETURN VALUE

The *seekdir*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The original standard developers perceived that there were restrictions on the use of the *seekdir*( ) and *telldir*( ) functions related to implementation details, and for that reason these functions need not be supported on all POSIX-conforming systems. They are required on implementations supporting the XSI option.

One of the perceived problems of implementation is that returning to a given point in a directory is quite difficult to describe formally, in spite of its intuitive appeal, when systems that use B-trees, hashing functions, or other similar mechanisms to order their directories are considered. The definition of *seekdir*( ) and *telldir*( ) does not specify whether, when using these interfaces, a given directory entry will be seen at all, or more than once.

On systems not supporting these functions, their capability can sometimes be accomplished by saving a filename found by *readdir*( ) and later using *rewinddir*( ) and a loop on *readdir*( ) to relocate the position from which the filename was saved.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2.

Issue 6

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

Issue 7

SD5-XSH-ERN-200 is applied, updating the DESCRIPTION to note that the value of *loc* should have been returned from an earlier call to *telldir*( ) using the same directory stream.

NAME

select — synchronous I/O multiplexing

SYNOPSIS

```
#include <sys/select.h>

int select(int nfds, fd_set *restrict readfds,
    fd_set *restrict writefds, fd_set *restrict errorfds,
    struct timeval *restrict timeout);
```

DESCRIPTION

Refer to *pselect( )*.

NAME

sem_close — close a named semaphore

SYNOPSIS

```
#include <semaphore.h>

int sem_close(sem_t *sem);
```

DESCRIPTION

The *sem_close*( ) function shall indicate that the calling process is finished using the named semaphore indicated by *sem*. The effects of calling *sem_close*( ) for an unnamed semaphore (one created by *sem_init*( )) are undefined. The *sem_close*( ) function shall deallocate (that is, make available for reuse by a subsequent *sem_open*( ) by this process) any system resources allocated by the system for use by this process for this semaphore. The effect of subsequent use of the semaphore indicated by *sem* by this process is undefined. If any threads in the calling process are currently blocked on the semaphore, the behavior is undefined. If the semaphore has not been removed with a successful call to *sem_unlink*( ), then *sem_close*( ) has no effect on the state of the semaphore. If the *sem_unlink*( ) function has been successfully invoked for *name* after the most recent call to *sem_open*( ) with O_CREAT for this semaphore, then when all processes that have opened the semaphore close it, the semaphore is no longer accessible.

RETURN VALUE

Upon successful completion, a value of zero shall be returned. Otherwise, a value of –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *sem_close*( ) function may fail if:

[EINVAL] The *sem* argument is not a valid semaphore descriptor.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *sem_close*( ) function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/113 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

Issue 7

The *sem_close*( ) function is moved from the Semaphores option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0523 [37] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0317 [870] is applied.

NAME

sem_destroy — destroy an unnamed semaphore

SYNOPSIS

```
#include <semaphore.h>

int sem_destroy(sem_t *sem);
```

DESCRIPTION

The *sem_destroy*( ) function shall destroy the unnamed semaphore indicated by *sem*. Only a semaphore that was created using *sem_init*( ) may be destroyed using *sem_destroy*( ); the effect of calling *sem_destroy*( ) with a named semaphore is undefined. The effect of subsequent use of the semaphore *sem* is undefined until *sem* is reinitialized by another call to *sem_init*( ).

It is safe to destroy an initialized semaphore upon which no threads are currently blocked. The effect of destroying a semaphore upon which other threads are currently blocked is undefined.

RETURN VALUE

Upon successful completion, a value of zero shall be returned. Otherwise, a value of –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *sem_destroy*( ) function may fail if:

[EINVAL] The *sem* argument is not a valid semaphore.

[EBUSY] There are currently processes blocked on the semaphore.

Issue 7

The *sem_destroy*( ) function is moved from the Semaphores option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0524 [37] is applied.

NAME

sem_getvalue — get the value of a semaphore

SYNOPSIS

```
#include <semaphore.h>

int sem_getvalue(sem_t *restrict sem, int *restrict sval);
```

DESCRIPTION

The *sem_getvalue*( ) function shall update the location referenced by the *sval* argument to have the value of the semaphore referenced by *sem* without affecting the state of the semaphore. The updated value represents an actual semaphore value that occurred at some unspecified time during the call, but it need not be the actual value of the semaphore when it is returned to the calling process.

If *sem* is locked, then the object to which *sval* points shall either be set to zero or to a negative number whose absolute value represents the number of processes waiting for the semaphore at some unspecified time during the call.

RETURN VALUE

Upon successful completion, the *sem_getvalue*( ) function shall return a value of zero. Otherwise, it shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *sem_getvalue*( ) function may fail if:

[EINVAL] The *sem* argument does not refer to a valid semaphore.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *sem_getvalue*( ) function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The *sem_timedwait*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *sem_getvalue*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/54 is applied.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/115 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

Issue 7

The *sem_getvalue*( ) function is moved from the Semaphores option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0525 [37] is applied.

NAME

sem_init — initialize an unnamed semaphore

SYNOPSIS

```
#include <semaphore.h>

int sem_init(sem_t *sem, int pshared, unsigned value);
```

DESCRIPTION

The *sem_init*( ) function shall initialize the unnamed semaphore referred to by *sem*. The value of the initialized semaphore shall be *value*. Following a successful call to *sem_init*( ), the semaphore may be used in subsequent calls to *sem_wait*( ), *sem_timedwait*( ), *sem_trywait*( ), *sem_post*( ), and *sem_destroy*( ). This semaphore shall remain usable until the semaphore is destroyed.

If the *pshared* argument has a non-zero value, then the semaphore is shared between processes; in this case, any process that can access the semaphore *sem* can use *sem* for performing *sem_wait*( ), *sem_timedwait*( ), *sem_trywait*( ), *sem_post*( ), and *sem_destroy*( ) operations.

If the *pshared* argument is zero, then the semaphore is shared between threads of the process; any thread in this process can use *sem* for performing *sem_wait*( ), *sem_timedwait*( ), *sem_trywait*( ), *sem_post*( ), and *sem_destroy*( ) operations.

See Section 2.9.9 (on page 523) for further requirements.

Attempting to initialize an already initialized semaphore results in undefined behavior.

RETURN VALUE

Upon successful completion, the *sem_init*( ) function shall initialize the semaphore in *sem* and return 0. Otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *sem_init*( ) function shall fail if:

[EINVAL] The *value* argument exceeds {SEM_VALUE_MAX}.

[ENOSPC] A resource required to initialize the semaphore has been exhausted, or the limit on semaphores ({SEM_NSEMS_MAX}) has been reached.

[EPERM] The process lacks appropriate privileges to initialize the semaphore.

NAME

sem_open — initialize and open a named semaphore

SYNOPSIS

```
#include <semaphore.h>

sem_t *sem_open(const char *name, int oflag, ...);
```

DESCRIPTION

The *sem_open*( ) function shall establish a connection between a named semaphore and a process. Following a call to *sem_open*( ) with semaphore name *name*, the process may reference the semaphore associated with *name* using the address returned from the call. This semaphore may be used in subsequent calls to *sem_wait*( ), *sem_timedwait*( ), *sem_trywait*( ), *sem_post*( ), and *sem_close*( ). The semaphore remains usable by this process until the semaphore is closed by a successful call to *sem_close*( ), *_exit*( ), or one of the *exec* functions.

The *oflag* argument controls whether the semaphore is created or merely accessed by the call to *sem_open*( ). The following flag bits may be set in *oflag*:

O_CREAT This flag is used to create a semaphore if it does not already exist. If O_CREAT is set and the semaphore already exists, then O_CREAT has no effect, except as noted under O_EXCL. Otherwise, *sem_open*( ) creates a named semaphore. The O_CREAT flag requires a third and a fourth argument: *mode*, which is of type **mode_t**, and *value*, which is of type **unsigned**. The semaphore is created with an initial value of *value*. Valid initial values for semaphores are less than or equal to {SEM_VALUE_MAX}.

The user ID of the semaphore shall be set to the effective user ID of the process. The group ID of the semaphore shall be set to the effective group ID of the process; however, if the *name* argument is visible in the file system, the group ID may be set to the group ID of the containing directory. The permission bits of the semaphore are set to the value of the *mode* argument except those set in the file mode creation mask of the process. When bits in *mode* other than the file permission bits are specified, the effect is unspecified.

After the semaphore named *name* has been created by *sem_open*( ) with the O_CREAT flag, other processes can connect to the semaphore by calling *sem_open*( ) with the same value of *name*.

O_EXCL If O_EXCL and O_CREAT are set, *sem_open*( ) fails if the semaphore *name* exists. The check for the existence of the semaphore and the creation of the semaphore if it does not exist are atomic with respect to other processes executing *sem_open*( ) with O_EXCL and O_CREAT set. If O_EXCL is set and O_CREAT is not set, the effect is undefined.

If flags other than O_CREAT and O_EXCL are specified in the *oflag* parameter, the effect is unspecified.

The *name* argument points to a string naming a semaphore object. It is unspecified whether the name appears in the file system and is visible to functions that take pathnames as arguments. The *name* argument conforms to the construction rules for a pathname, except that the interpretation of <slash> characters other than the leading <slash> character in *name* is implementation-defined, and that the length limits for the *name* argument are implementation-defined and need not be the same as the pathname limits {PATH_MAX} and {NAME_MAX}. If *name* begins with the <slash> character, then processes calling *sem_open*( ) with the same value of *name* shall refer to the same semaphore object, as long as that name has not been removed. If *name* does not begin with the <slash> character, the effect is implementation-defined.

If a process makes multiple successful calls to *sem_open*( ) with the same value for *name*, the same semaphore address shall be returned for each such successful call, provided that there have been no calls to *sem_unlink*( ) for this semaphore, and at least one previous successful *sem_open*( ) call for this semaphore has not been matched with a *sem_close*( ) call.

References to copies of the semaphore produce undefined results.

RETURN VALUE

Upon successful completion, the *sem_open*( ) function shall return the address of the semaphore. Otherwise, it shall return a value of SEM_FAILED and set *errno* to indicate the error. The symbol SEM_FAILED is defined in the **<semaphore.h>** header. No successful return from *sem_open*( ) shall return the value SEM_FAILED.

ERRORS

If any of the following conditions occur, the *sem_open*( ) function shall return SEM_FAILED and set *errno* to the corresponding value:

[EACCES] The named semaphore exists and the permissions specified by *oflag* are denied, or the named semaphore does not exist and permission to create the named semaphore is denied.

[EEXIST] O_CREAT and O_EXCL are set and the named semaphore already exists.

[EINTR] The *sem_open*( ) operation was interrupted by a signal.

[EINVAL] The *sem_open*( ) operation is not supported for the given name, or O_CREAT was specified in *oflag* and *value* was greater than {SEM_VALUE_MAX}.

[EMFILE] Too many semaphore descriptors or file descriptors are currently in use by this process.

[ENFILE] Too many semaphores are currently open in the system.

[ENOENT] O_CREAT is not set and the named semaphore does not exist.

[ENOMEM] There is insufficient memory for the creation of the new named semaphore.

[ENOSPC] There is insufficient space on a storage device for the creation of the new named semaphore.

If any of the following conditions occur, the *sem_open*( ) function may return SEM_FAILED and set *errno* to the corresponding value:

[ENAMETOOLONG]
The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI systems, or has a pathname component that is longer than {_POSIX_NAME_MAX} on systems that do not support the XSI option or longer than {_XOPEN_NAME_MAX} on XSI systems.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Early drafts required an error return value of −1 with the type **sem_t *** for the *sem_open*( ) function, which is not guaranteed to be portable across implementations. The revised text provides the symbolic error code SEM_FAILED to eliminate the type conflict.

FUTURE DIRECTIONS

A future version might require the *sem_open*( ) and *sem_unlink*( ) functions to have semantics similar to normal file system operations.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *sem_open*( ) function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The *sem_timedwait*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/117 is applied, updating the DESCRIPTION to add the *sem_timedwait*( ) function for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/118 is applied, updating the DESCRIPTION to describe the conditions to return the same semaphore address on a call to *sem_open*( ). The words ``and at least one previous successful *sem_open*( ) call for this semaphore has not been matched with a *sem_close*( ) call'' are added.

Issue 7

Austin Group Interpretation 1003.1-2001 #066 is applied, updating the [ENOSPC] error case and adding the [ENOMEM] error case.

Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and adding [ENAMETOOLONG] as a ``may fail'' error.

Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the user ID and group ID of the semaphore.

The *sem_open*( ) function is moved from the Semaphores option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0527 [37] is applied.

60083 **NAME**

60084 sem_post — unlock a semaphore

60085 **SYNOPSIS**

60086 `#include <semaphore.h>`

60087 `int sem_post(sem_t *sem);`

60088 **DESCRIPTION**

60089 The *sem_post*( ) function shall unlock the semaphore referenced by *sem* by performing a
60090 semaphore unlock operation on that semaphore.

60091 If the semaphore value resulting from this operation is positive, then no threads were blocked
60092 waiting for the semaphore to become unlocked; the semaphore value is simply incremented.

60093 If the value of the semaphore resulting from this operation is zero, then one of the threads
60094 blocked waiting for the semaphore shall be allowed to return successfully from its call to
60095 PS *sem_wait*( ). If the Process Scheduling option is supported, the thread to be unblocked shall be
60096 chosen in a manner appropriate to the scheduling policies and parameters in effect for the
60097 blocked threads. In the case of the schedulers SCHED_FIFO and SCHED_RR, the highest
60098 priority waiting thread shall be unblocked, and if there is more than one highest priority thread
60099 blocked waiting for the semaphore, then the highest priority thread that has been waiting the
60100 longest shall be unblocked. If the Process Scheduling option is not defined, the choice of a thread
60101 to unblock is unspecified.

60102 SS If the Process Sporadic Server option is supported, and the scheduling policy is
60103 SCHED_SPORADIC, the semantics are as per SCHED_FIFO above.

60104 The *sem_post*( ) function shall be async-signal-safe and may be invoked from a signal-catching
60105 function.

60106 **RETURN VALUE**

60107 If successful, the *sem_post*( ) function shall return zero; otherwise, the function shall return −1
60108 and set *errno* to indicate the error.

60109 **ERRORS**

60110 The *sem_post*( ) function may fail if:

60111 [EINVAL] The *sem* argument does not refer to a valid semaphore.

60112 **EXAMPLES**

60113 See *sem_timedwait*( ).

60114 **APPLICATION USAGE**

60115 None.

60116 **RATIONALE**

60117 None.

60118 **FUTURE DIRECTIONS**

60119 None.

60120 **SEE ALSO**

60121 *semctl*( ), *semget*( ), *semop*( ), *sem_timedwait*( ), *sem_trywait*( )

60122 XBD Section 4.12 (on page 111), **<semaphore.h>**

60123 **CHANGE HISTORY**

60124 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

60125 **Issue 6**

60126 The *sem_post*( ) function is marked as part of the Semaphores option.

60127 The [ENOSYS] error condition has been removed as stubs need not be provided if an
60128 implementation does not support the Semaphores option.

60129 The *sem_timedwait*( ) function is added to the SEE ALSO section for alignment with IEEE Std
60130 1003.1d-1999.

60131 SCHED_SPORADIC is added to the list of scheduling policies for which the thread that is to be
60132 unblocked is specified for alignment with IEEE Std 1003.1d-1999.

60133 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/119 is applied, updating the ERRORS
60134 section so that the [EINVAL] error becomes optional.

60135 **Issue 7**

60136 Austin Group Interpretation 1003.1-2001 #156 is applied.

60137 The *sem_post*( ) function is moved from the Semaphores option to the Base.

60138 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0528 [37] is applied.

60139 **NAME**

60140 sem_timedwait — lock a semaphore

60141 **SYNOPSIS**

60142 ```
#include <semaphore.h>
```

60143 ```
#include <time.h>
```

60144 ```
int sem_timedwait(sem_t *restrict sem,
```

60145 ```
    const struct timespec *restrict abstime);
```

60146 **DESCRIPTION**

60147 The *sem_timedwait*( ) function shall lock the semaphore referenced by *sem* as in the *sem_wait*( )
60148 function. However, if the semaphore cannot be locked without waiting for another process or
60149 thread to unlock the semaphore by performing a *sem_post*( ) function, this wait shall be
60150 terminated when the specified timeout expires.

60151 The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the
60152 clock on which timeouts are based (that is, when the value of that clock equals or exceeds
60153 *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the
60154 call.

60155 The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall
60156 be the resolution of the clock on which it is based. The **timespec** data type is defined as a
60157 structure in the **<time.h>** header.

60158 Under no circumstance shall the function fail with a timeout if the semaphore can be locked
60159 immediately. The validity of the *abstime* need not be checked if the semaphore can be locked
60160 immediately.

60161 **RETURN VALUE**

60162 The *sem_timedwait*( ) function shall return zero if the calling process successfully performed the
60163 semaphore lock operation on the semaphore designated by *sem*. If the call was unsuccessful, the
60164 state of the semaphore shall be unchanged, and the function shall return a value of −1 and set
60165 *errno* to indicate the error.

60166 **ERRORS**

60167 The *sem_timedwait*( ) function shall fail if:

60168 [EINVAL] The process or thread would have blocked, and the *abstime* parameter
60169 specified a nanoseconds field value less than zero or greater than or equal to
60170 1 000 million.

60171 [ETIMEDOUT] The semaphore could not be locked before the specified timeout expired.

60172 The *sem_timedwait*( ) function may fail if:

60173 [EDEADLK] A deadlock condition was detected.

60174 [EINTR] A signal interrupted this function.

60175 [EINVAL] The *sem* argument does not refer to a valid semaphore.

EXAMPLES

The program shown below operates on an unnamed semaphore. The program expects two command-line arguments. The first argument specifies a seconds value that is used to set an alarm timer to generate a SIGALRM signal. This handler performs a *sem_post*(3) to increment the semaphore that is being waited on in *main*( ) using *sem_timedwait*( ). The second command-line argument specifies the length of the timeout, in seconds, for *sem_timedwait*( ).

```
#include <unistd.h>
#include <stdio.h>
#include <stdlib.h>
#include <semaphore.h>
#include <time.h>
#include <assert.h>
#include <errno.h>
#include <signal.h>

sem_t sem;

static void
handler(int sig)
{
    int sav_errno = errno;
    static const char info_msg[] = "sem_post() from handler\n";
    write(STDOUT_FILENO, info_msg, sizeof info_msg - 1);
    if (sem_post(&sem) == -1) {
        static const char err_msg[] = "sem_post() failed\n";
        write(STDERR_FILENO, err_msg, sizeof err_msg - 1);
        _exit(EXIT_FAILURE);
    }
    errno = sav_errno;
}

int
main(int argc, char *argv[])
{
    struct sigaction sa;
    struct timespec ts;
    int s;

    if (argc != 3) {
        fprintf(stderr, "Usage: %s <alarm-secs> <wait-secs>\n",
            argv[0]);
        exit(EXIT_FAILURE);
    }

    if (sem_init(&sem, 0, 0) == -1) {
        perror("sem_init");
        exit(EXIT_FAILURE);
    }

    /* Establish SIGALRM handler; set alarm timer using argv[1] */

    sa.sa_handler = handler;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = 0;
    if (sigaction(SIGALRM, &sa, NULL) == -1) {
```

```
60224                perror("sigaction");
60225                exit(EXIT_FAILURE);
60226            }
60227            alarm(atoi(argv[1]));
60228            /* Calculate relative interval as current time plus
60229               number of seconds given argv[2] */
60230            if (clock_gettime(CLOCK_REALTIME, &ts) == -1) {
60231                perror("clock_gettime");
60232                exit(EXIT_FAILURE);
60233            }
60234            ts.tv_sec += atoi(argv[2]);
60235            printf("main() about to call sem_timedwait()\n");
60236            while ((s = sem_timedwait(&sem, &ts)) == -1 && errno == EINTR)
60237                continue;       /* Restart if interrupted by handler */
60238            /* Check what happened */
60239            if (s == -1) {
60240                if (errno == ETIMEDOUT)
60241                    printf("sem_timedwait() timed out\n");
60242                else
60243                    perror("sem_timedwait");
60244            } else
60245                printf("sem_timedwait() succeeded\n");
60246            exit((s == 0) ? EXIT_SUCCESS : EXIT_FAILURE);
60247        }
```

APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in XBD Section 3.291 (on page 80).

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/120 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

Issue 7

The *sem_timedwait( )* function is moved from the Semaphores option to the Base.

Functionality relating to the Timers option is moved to the Base.

An example is added.

60266 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0529 [138] is applied.

NAME

sem_trywait, sem_wait — lock a semaphore

SYNOPSIS

```
#include <semaphore.h>

int sem_trywait(sem_t *sem);
int sem_wait(sem_t *sem);
```

DESCRIPTION

The *sem_trywait*( ) function shall lock the semaphore referenced by *sem* only if the semaphore is currently not locked; that is, if the semaphore value is currently positive. Otherwise, it shall not lock the semaphore.

The *sem_wait*( ) function shall lock the semaphore referenced by *sem* by performing a semaphore lock operation on that semaphore. If the semaphore value is currently zero, then the calling thread shall not return from the call to *sem_wait*( ) until it either locks the semaphore or the call is interrupted by a signal.

Upon successful return, the state of the semaphore shall be locked and shall remain locked until the *sem_post*( ) function is executed and returns successfully.

The *sem_wait*( ) function is interruptible by the delivery of a signal.

RETURN VALUE

The *sem_trywait*( ) and *sem_wait*( ) functions shall return zero if the calling process successfully performed the semaphore lock operation on the semaphore designated by *sem*. If the call was unsuccessful, the state of the semaphore shall be unchanged, and the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *sem_trywait*( ) function shall fail if:

[EAGAIN] The semaphore was already locked, so it cannot be immediately locked by the *sem_trywait*( ) operation.

The *sem_trywait*( ) and *sem_wait*( ) functions may fail if:

[EDEADLK] A deadlock condition was detected.

[EINTR] A signal interrupted this function.

[EINVAL] The *sem* argument does not refer to a valid semaphore.

EXAMPLES

None.

APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in XBD Section 3.291 (on page 80).

RATIONALE

None.

FUTURE DIRECTIONS

None.

60309 **CHANGE HISTORY**

60310 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

60311 **Issue 6**

60312 The *sem_trywait*( ) and *sem_wait*( ) functions are marked as part of the Semaphores option.

60313 The [ENOSYS] error condition has been removed as stubs need not be provided if an
60314 implementation does not support the Semaphores option.

60315 The *sem_timedwait*( ) function is added to the SEE ALSO section for alignment with IEEE Std
60316 1003.1d-1999.

60317 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/121 is applied, updating the ERRORS
60318 section so that the [EINVAL] error becomes optional.

60319 **Issue 7**

60320 SD5-XSH-ERN-54 is applied, removing the *sem_wait*( ) function from the ``shall fail'' error cases.

60321 The *sem_trywait*( ) and *sem_wait*( ) functions are moved from the Semaphores option to the Base.

60322 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0530 [37] is applied.

NAME

sem_unlink — remove a named semaphore

SYNOPSIS

```
#include <semaphore.h>

int sem_unlink(const char *name);
```

DESCRIPTION

The *sem_unlink*( ) function shall remove the semaphore named by the string *name*. If the semaphore named by *name* is currently referenced by other processes, then *sem_unlink*( ) shall have no effect on the state of the semaphore. If one or more processes have the semaphore open when *sem_unlink*( ) is called, destruction of the semaphore is postponed until all references to the semaphore have been destroyed by calls to *sem_close*( ), *_exit*( ), or *exec*. Calls to *sem_open*( ) to recreate or reconnect to the semaphore refer to a new semaphore after *sem_unlink*( ) is called. The *sem_unlink*( ) call shall not block until all references have been destroyed; it shall return immediately.

RETURN VALUE

Upon successful completion, the *sem_unlink*( ) function shall return a value of 0. Otherwise, the semaphore shall not be changed and the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *sem_unlink*( ) function shall fail if:

[EACCES] Permission is denied to unlink the named semaphore.

[ENOENT] The named semaphore does not exist.

The *sem_unlink*( ) function may fail if:

[ENAMETOOLONG]
The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems that do not support the XSI option (XSI) or exceeds {_XOPEN_PATH_MAX} on XSI systems, or has a pathname component that is longer than {_POSIX_NAME_MAX} on systems that do not support the XSI option (XSI) or longer than {_XOPEN_NAME_MAX} on XSI systems. A call to *sem_unlink*( ) with a *name* argument that contains the same semaphore name as was previously used in a successful *sem_open*( ) call shall not give an [ENAMETOOLONG] error.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

A future version might require the *sem_open*( ) and *sem_unlink*( ) functions to have semantics similar to normal file system operations.

NAME

semctl ‡ XSI semaphore control operations

SYNOPSIS

XSI
```
#include <sys/sem.h>

int semctl(int semid, int semnum, int cmd, ...);
```

DESCRIPTION

The *semctl*( ) function operates on XSI semaphores (see XBD Section 4.17, on page 114). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 503).

The *semctl*( ) function provides a variety of semaphore control operations as specified by *cmd*. The fourth argument is optional and depends upon the operation requested. If required, it is of type **union semun**, which the application shall explicitly declare:

```
union semun {
    int val;
    struct semid_ds *buf;
    unsigned short  *array;
} arg;
```

Each operation shall be performed atomically.

The following semaphore control operations as specified by *cmd* are executed with respect to the semaphore specified by *semid* and *semnum*. The level of permission required for each operation is shown with each command; see Section 2.7 (on page 501). The symbolic names for the values of *cmd* are defined in the **<sys/sem.h>** header:

GETVAL Return the value of *semval*; see **<sys/sem.h>**. Requires read permission.

SETVAL Set the value of *semval* to *arg.val*, where *arg* is the value of the fourth argument to *semctl*( ). When this command is successfully executed, the *semadj* value corresponding to the specified semaphore in all processes is cleared. Also, the *sem_ctime* timestamp shall be set to the current time, as described in Section 2.7.1 (on page 502). Requires alter permission; see Section 2.7 (on page 501).

GETPID Return the value of *sempid*. Requires read permission.

GETNCNT Return the value of *semncnt*. Requires read permission.

GETZCNT Return the value of *semzcnt*. Requires read permission.

The following values of *cmd* operate on each *semval* in the set of semaphores:

GETALL Return the value of *semval* for each semaphore in the semaphore set and place into the array pointed to by *arg.array*, where *arg* is the fourth argument to *semctl*( ). Requires read permission.

SETALL Set the value of *semval* for each semaphore in the semaphore set according to the array pointed to by *arg.array*, where *arg* is the fourth argument to *semctl*( ). When this command is successfully executed, the *semadj* values corresponding to each specified semaphore in all processes are cleared. Also, the *sem_ctime* timestamp shall be set to the current time, as described in Section 2.7.1 (on page 502). Requires alter permission.

The following values of *cmd* are also available:

IPC_STAT — Place the current value of each member of the **semid_ds** data structure associated with *semid* into the structure pointed to by *arg.buf*, where *arg* is the fourth argument to *semctl*( ). The contents of this structure are defined in **<sys/sem.h>**. Requires read permission.

IPC_SET — Set the value of the following members of the **semid_ds** data structure associated with *semid* to the corresponding value found in the structure pointed to by *arg.buf*, where *arg* is the fourth argument to *semctl*( ):

```
sem_perm.uid
sem_perm.gid
sem_perm.mode
```

The mode bits specified in Section 2.7.1 (on page 502) are copied into the corresponding bits of the *sem_perm.mode* associated with *semid*. The stored values of any other bits are unspecified. The *sem_ctime* timestamp shall be set to the current time, as described in Section 2.7.1 (on page 502).

This command can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of *sem_perm.cuid* or *sem_perm.uid* in the **semid_ds** data structure associated with *semid*.

IPC_RMID — Remove the semaphore identifier specified by *semid* from the system and destroy the set of semaphores and **semid_ds** data structure associated with it. This command can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of *sem_perm.cuid* or *sem_perm.uid* in the **semid_ds** data structure associated with *semid*.

RETURN VALUE

If successful, the value returned by *semctl*( ) depends on *cmd* as follows:

GETVAL — The value of *semval*.

GETPID — The value of *sempid*.

GETNCNT — The value of *semncnt*.

GETZCNT — The value of *semzcnt*.

All others — 0.

Otherwise, *semctl*( ) shall return −1 and set *errno* to indicate the error.

ERRORS

The *semctl*( ) function shall fail if:

[EACCES] — Operation permission is denied to the calling process; see Section 2.7 (on page 501).

[EINVAL] — The value of *semid* is not a valid semaphore identifier, or the value of *semnum* is less than 0 or greater than or equal to *sem_nsems*, or the value of *cmd* is not a valid command.

[EPERM] — The argument *cmd* is equal to IPC_RMID or IPC_SET and the effective user ID of the calling process is not equal to that of a process with appropriate privileges and it is not equal to the value of *sem_perm.cuid* or *sem_perm.uid* in

the data structure associated with *semid*.

[ERANGE] The argument *cmd* is equal to SETVAL or SETALL and the value to which *semval* is to be set is greater than the system-imposed maximum.

EXAMPLES

Refer to *semop( )*.

APPLICATION USAGE

The fourth parameter in the SYNOPSIS section is now specified as `"..."` in order to avoid a clash with the ISO C standard when referring to the union *semun* (as defined in Issue 3) and for backwards-compatibility.

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 501) can be easily modified to use the alternative interfaces.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0532 [345], XSH/TC1-2008/0533 [345], XSH/TC1-2008/0534 [345], and XSH/TC1-2008/0535 [335] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0319 [532] is applied.

NAME

semget — get set of XSI semaphores

SYNOPSIS

XSI

```
#include <sys/sem.h>

int semget(key_t key, int nsems, int semflg);
```

DESCRIPTION

The *semget*( ) function operates on XSI semaphores (see XBD Section 4.17, on page 114). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 503).

The *semget*( ) function shall return the semaphore identifier associated with *key*.

A semaphore identifier with its associated **semid_ds** data structure and its associated set of *nsems* semaphores (see **<sys/sem.h>**) is created for *key* if one of the following is true:

The argument *key* is equal to IPC_PRIVATE.

The argument *key* does not already have a semaphore identifier associated with it and (*semflg* &IPC_CREAT) is non-zero.

Upon creation, the **semid_ds** data structure associated with the new semaphore identifier is initialized as follows:

In the operation permissions structure *sem_perm.cuid*, *sem_perm.uid*, *sem_perm.cgid*, and *sem_perm.gid* shall be set to the effective user ID and effective group ID, respectively, of the calling process.

The low-order 9 bits of *sem_perm.mode* shall be set to the low-order 9 bits of *semflg*.

The variable *sem_nsems* shall be set to the value of *nsems*.

The variable *sem_otime* shall be set to 0 and *sem_ctime* shall be set to the current time, as described in Section 2.7.1 (on page 502).

The data structure associated with each semaphore in the set need not be initialized. The *semctl*( ) function with the command SETVAL or SETALL can be used to initialize each semaphore.

RETURN VALUE

Upon successful completion, *semget*( ) shall return a non-negative integer, namely a semaphore identifier; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *semget*( ) function shall fail if:

[EACCES] A semaphore identifier exists for *key*, but operation permission as specified by the low-order 9 bits of *semflg* would not be granted; see Section 2.7 (on page 501).

[EEXIST] A semaphore identifier exists for the argument *key* but ((*semflg* &IPC_CREAT) &&(*semflg* &IPC_EXCL)) is non-zero.

[EINVAL] The value of *nsems* is either less than or equal to 0 or greater than the system-imposed limit, or a semaphore identifier exists for the argument *key*, but the number of semaphores in the set associated with it is less than *nsems* and *nsems* is not equal to 0.

[ENOENT] A semaphore identifier does not exist for the argument *key* and (*semflg* &IPC_CREAT) is equal to 0.

[ENOSPC] A semaphore identifier is to be created but the system-imposed limit on the maximum number of allowed semaphores system-wide would be exceeded.

EXAMPLES

Refer to *semop*( ).

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 501) can be easily modified to use the alternative interfaces.

RATIONALE

None.

FUTURE DIRECTIONS

A future version may require that the value of the *semval*, *sempid*, *semncnt*, and *semzcnt* members of all semaphores in a semaphore set be initialized to zero when a call to *semget*( ) creates a semaphore set. Many semaphore implementations already do this and it greatly simplifies what an application must do to initialize a semaphore set.

CHANGE HISTORY

First released in Issue 2. Derived from Issue 2 of the SVID.

Issue 5

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.

Issue 6

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/122 is applied, updating the DESCRIPTION from ``each semaphore in the set shall not be initialized'' to ``each semaphore in the set need not be initialized''.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0536 [335,439] and XSH/TC1-2008/0537 [344] are applied.

NAME

semop ‡'XSI semaphore operations

SYNOPSIS

XSI
```
#include <sys/sem.h>

int semop(int semid, struct sembuf *sops, size_t nsops);
```

DESCRIPTION

The *semop*( ) function operates on XSI semaphores (see XBD Section 4.17, on page 114). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 503).

The *semop*( ) function shall perform atomically a user-defined array of semaphore operations in array order on the set of semaphores associated with the semaphore identifier specified by the argument *semid*.

The argument *sops* is a pointer to a user-defined array of semaphore operation structures. The implementation shall not modify elements of this array unless the application uses implementation-defined extensions.

The argument *nsops* is the number of such structures in the array.

Each structure, **sembuf**, includes the following members:

Member Type	Member Name	Description
unsigned short	*sem_num*	Semaphore number.
short	*sem_op*	Semaphore operation.
short	*sem_flg*	Operation flags.

Each semaphore operation specified by *sem_op* is performed on the corresponding semaphore specified by *semid* and *sem_num*.

The variable *sem_op* specifies one of three semaphore operations:

1. If *sem_op* is a negative integer and the calling process has alter permission, one of the following shall occur:

   If *semval*(see **<sys/sem.h>**) is greater than or equal to the absolute value of *sem_op*, the absolute value of *sem_op* is subtracted from *semval*. Also, if (*sem_flg* &SEM_UNDO) is non-zero, the absolute value of *sem_op* shall be added to the *semadj* value of the calling process for the specified semaphore.

   If *semval* is less than the absolute value of *sem_op* and (*sem_flg* &IPC_NOWAIT) is non-zero, *semop*( ) shall return immediately.

   If *semval* is less than the absolute value of *sem_op* and (*sem_flg* &IPC_NOWAIT) is 0, *semop*( ) shall increment the *semncnt* associated with the specified semaphore and suspend execution of the calling thread until one of the following conditions occurs:

   ‡ĸŒvalue of *semval* becomes greater than or equal to the absolute value of *sem_op*. When this occurs, the value of *semncnt* associated with the specified semaphore shall be decremented, the absolute value of *sem_op* shall be subtracted from *semval* and, if (*sem_flg* &SEM_UNDO) is non-zero, the absolute value of *sem_op* shall be added to the *semadj* value of the calling process for the specified semaphore.

60616 ‡ The *semid* for which the calling thread is awaiting action is removed from the
60617 system. When this occurs, *errno* shall be set to [EIDRM] and −1 shall be
60618 returned.

60619 ‡ The calling thread receives a signal that is to be caught. When this occurs, the
60620 value of *semncnt* associated with the specified semaphore shall be
60621 decremented, and the calling thread shall resume execution in the manner
60622 prescribed in *sigaction*( ).

60623 2. If *sem_op* is a positive integer and the calling process has alter permission, the value of
60624 *sem_op* shall be added to *semval* and, if (*sem_flg* &SEM_UNDO) is non-zero, the value of
60625 *sem_op* shall be subtracted from the *semadj* value of the calling process for the specified
60626 semaphore.

60627 3. If *sem_op* is 0 and the calling process has read permission, one of the following shall occur:

60628 If *semval* is 0, *semop*( ) shall return immediately.

60629 If *semval* is non-zero and (*sem_flg* &IPC_NOWAIT) is non-zero, *semop*( ) shall return
60630 immediately.

60631 If *semval* is non-zero and (*sem_flg* &IPC_NOWAIT) is 0, *semop*( ) shall increment the
60632 *semzcnt* associated with the specified semaphore and suspend execution of the
60633 calling thread until one of the following occurs:

60634 ‡ The value of *semval* becomes 0, at which time the value of *semzcnt* associated
60635 with the specified semaphore shall be decremented.

60636 ‡ The *semid* for which the calling thread is awaiting action is removed from the
60637 system. When this occurs, *errno* shall be set to [EIDRM] and −1 shall be
60638 returned.

60639 ‡ The calling thread receives a signal that is to be caught. When this occurs, the
60640 value of *semzcnt* associated with the specified semaphore shall be
60641 decremented, and the calling thread shall resume execution in the manner
60642 prescribed in *sigaction*( ).

60643 Upon successful completion, the value of *sempid* for each semaphore specified in the array
60644 pointed to by *sops* shall be set to the process ID of the calling process. Also, the *sem_otime*
60645 timestamp shall be set to the current time, as described in Section 2.7.1 (on page 502).

60646 **RETURN VALUE**

60647 Upon successful completion, *semop*( ) shall return 0; otherwise, it shall return −1 and set *errno* to
60648 indicate the error.

60649 **ERRORS**

60650 The *semop*( ) function shall fail if:

60651 [E2BIG] The value of *nsops* is greater than the system-imposed maximum.

60652 [EACCES] Operation permission is denied to the calling process; see Section 2.7 (on page
60653 501).

60654 [EAGAIN] The operation would result in suspension of the calling process but (*sem_flg*
60655 &IPC_NOWAIT) is non-zero.

60656 [EFBIG] The value of *sem_num* is greater than or equal to the number of semaphores in
60657 the set associated with *semid*.

60658 [EIDRM] The semaphore identifier *semid* is removed from the system.

60659 [EINTR] The *semop*( ) function was interrupted by a signal.

60660 [EINVAL] The value of *semid* is not a valid semaphore identifier, or the number of
60661 individual semaphores for which the calling process requests a SEM_UNDO
60662 would exceed the system-imposed limit.

60663 [ENOSPC] The limit on the number of individual processes requesting a SEM_UNDO
60664 would be exceeded.

60665 [ERANGE] An operation would cause a *semval* to overflow the system-imposed limit, or
60666 an operation would cause a *semadj* value to overflow the system-imposed
60667 limit.

60668 **EXAMPLES**

60669 **Setting Values in Semaphores**

60670 The following example sets the values of the two semaphores associated with the *semid* identifier
60671 to the values contained in the *sb* array.

```
60672 #include <sys/sem.h>
60673 ...
60674 int semid;
60675 struct sembuf sb[2];
60676 int nsops = 2;
60677 int result;

60678 /* Code to initialize semid. */
60679 ...

60680 /* Adjust value of semaphore in the semaphore array semid. */
60681 sb[0].sem_num = 0;
60682 sb[0].sem_op = -1;
60683 sb[0].sem_flg = SEM_UNDO | IPC_NOWAIT;
60684 sb[1].sem_num = 1;
60685 sb[1].sem_op = 1;
60686 sb[1].sem_flg = 0;

60687 result = semop(semid, sb, nsops);
```

60688 **Creating a Semaphore Identifier**

60689 The following example gets a unique semaphore key using the *ftok*( ) function, then gets a
60690 semaphore ID associated with that key using the *semget*( ) function (the first call also tests to
60691 make sure the semaphore exists). If the semaphore does not exist, the program creates it, as
60692 shown by the second call to *semget*( ). In creating the semaphore for the queuing process, the
60693 program attempts to create one semaphore with read/write permission for all. It also uses the
60694 IPC_EXCL flag, which forces *semget*( ) to fail if the semaphore already exists.

60695 After creating the semaphore, the program uses calls to *semctl*( ) and *semop*( ) to initialize it to the
60696 values in the *sbuf* array. The number of processes that can execute concurrently without queuing
60697 is initially set to 2. The final call to *semget*( ) creates a semaphore identifier that can be used later
60698 in the program.

60699 Processes that obtain *semid* without creating it check that *sem_otime* is non-zero, to ensure that
60700 the creating process has completed the *semop*( ) initialization.

The final call to *semop*( ) acquires the semaphore and waits until it is free; the SEM_UNDO option releases the semaphore when the process exits, waiting until there are less than two processes running concurrently.

```
#include <stdio.h>
#include <sys/sem.h>
#include <sys/stat.h>
#include <errno.h>
#include <stdlib.h>
...
key_t semkey;
int semid;
struct sembuf sbuf;
union semun {
    int val;
    struct semid_ds *buf;
    unsigned short *array;
} arg;
struct semid_ds ds;
...
/* Get unique key for semaphore. */
if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
    perror("IPC error: ftok"); exit(1);
}

/* Get semaphore ID associated with this key. */
if ((semid = semget(semkey, 0, 0)) == -1) {

    /* Semaphore does not exist - Create. */
    if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
        S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1)
    {
        /* Initialize the semaphore. */
        arg.val = 0;
        sbuf.sem_num = 0;
        sbuf.sem_op = 2;  /* This is the number of runs without queuing. */
        sbuf.sem_flg = 0;
        if (semctl(semid, 0, SETVAL, arg) == -1
            || semop(semid, &sbuf, 1) == -1) {
            perror("IPC error: semop"); exit(1);
        }
    }
    else if (errno == EEXIST) {
        if ((semid = semget(semkey, 0, 0)) == -1) {
            perror("IPC error 1: semget"); exit(1);
        }
        goto check_init;
    }
    else {
        perror("IPC error 2: semget"); exit(1);
    }
}
else
```

```
60751         {
60752             /* Check that semid has completed initialization. */
60753             /* An application can use a retry loop at this point rather than
60754                exiting. */
60755             check_init:
60756             arg.buf = &ds;
60757             if (semctl(semid, 0, IPC_STAT, arg) < 0) {
60758                 perror("IPC error 3: semctl"); exit(1);
60759             }
60760             if (ds.sem_otime == 0) {
60761                 perror("IPC error 4: semctl"); exit(1);
60762             }
60763         }
60764         ...
60765         sbuf.sem_num = 0;
60766         sbuf.sem_op = -1;
60767         sbuf.sem_flg = SEM_UNDO;
60768         if (semop(semid, &sbuf, 1) == -1) {
60769             perror("IPC Error: semop"); exit(1);
60770         }
```

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 501) can be easily modified to use the alternative interfaces.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2. Derived from Issue 2 of the SVID.

Issue 5

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.

Issue 7

SD5-XSH-ERN-171 is applied, updating the DESCRIPTION to clarify the order in which the operations in *sops* will be performed when there are multiple operations.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0538 [329,429], XSH/TC1-2008/0539 [345,428], XSH/TC1-2008/0540 [329,429], XSH/TC1-2008/0541 [335], and XSH/TC1-2008/0542 [291,429] are applied.

60796 **NAME**

60797 send ‡'send a message on a socket

60798 **SYNOPSIS**

60799 `#include <sys/socket.h>`

60800 `ssize_t send(int` *`socket`*`, const void *`*`buffer`*`, size_t` *`length`*`, int` *`flags`*`);`

60801 **DESCRIPTION**

60802 The *send*( ) function shall initiate transmission of a message from the specified socket to its peer.
60803 The *send*( ) function shall send a message only when the socket is connected. If the socket is a
60804 connectionless-mode socket, the message shall be sent to the pre-specified peer address.

60805 The *send*( ) function takes the following arguments:

60806 *socket* Specifies the socket file descriptor.

60807 *buffer* Points to the buffer containing the message to send.

60808 *length* Specifies the length of the message in bytes.

60809 *flags* Specifies the type of message transmission. Values of this argument are
60810 formed by logically OR'ing zero or more of the following flags:

60811 MSG_EOR Terminates a record (if supported by the protocol).

60812 MSG_OOB Sends out-of-band data on sockets that support out-of-
60813 band communications. The significance and semantics
60814 of out-of-band data are protocol-specific.

60815 MSG_NOSIGNAL Requests not to send the SIGPIPE signal if an attempt to
60816 send is made on a stream-oriented socket that is no
60817 longer connected. The [EPIPE] error shall still be
60818 returned.

60819 The length of the message to be sent is specified by the *length* argument. If the message is too
60820 long to pass through the underlying protocol, *send*( ) shall fail and no data shall be transmitted.

60821 Successful completion of a call to *send*( ) does not guarantee delivery of the message. A return
60822 value of –1 indicates only locally-detected errors.

60823 If space is not available at the sending socket to hold the message to be transmitted, and the
60824 socket file descriptor does not have O_NONBLOCK set, *send*( ) shall block until space is
60825 available. If space is not available at the sending socket to hold the message to be transmitted,
60826 and the socket file descriptor does have O_NONBLOCK set, *send*( ) shall fail. The *select*( ) and
60827 *poll*( ) functions can be used to determine when it is possible to send more data.

60828 The socket in use may require the process to have appropriate privileges to use the *send*( )
60829 function.

60830 **RETURN VALUE**

60831 Upon successful completion, *send*( ) shall return the number of bytes sent. Otherwise, –1 shall be
60832 returned and *errno* set to indicate the error.

60833 **ERRORS**

60834 The *send*( ) function shall fail if:

60835 [EAGAIN] or [EWOULDBLOCK]
60836 The socket's file descriptor is marked O_NONBLOCK and the requested
60837 operation would block.

60838 [EBADF] The *socket* argument is not a valid file descriptor.

60839 [ECONNRESET] A connection was forcibly closed by a peer.

60840 [EDESTADDRREQ]
60841 The socket is not connection-mode and no peer address is set.

60842 [EINTR] A signal interrupted *send*( ) before any data was transmitted.

60843 [EMSGSIZE] The message is too large to be sent all at once, as the socket requires.

60844 [ENOTCONN] The socket is not connected.

60845 [ENOTSOCK] The *socket* argument does not refer to a socket.

60846 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or
60847 more of the values set in *flags*.

60848 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is
60849 no longer connected. In the latter case, and if the socket is of type
60850 SOCK_STREAM or SOCK_SEQPACKET and the MSG_NOSIGNAL flag is not
60851 set, the SIGPIPE signal is generated to the calling thread.

60852 The *send*( ) function may fail if:

60853 [EACCES] The calling process does not have appropriate privileges.

60854 [EIO] An I/O error occurred while reading from or writing to the file system.

60855 [ENETDOWN] The local network interface used to reach the destination is down.

60856 [ENETUNREACH]
60857 No route to the network is present.

60858 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

60859 **EXAMPLES**

60860 None.

60861 **APPLICATION USAGE**

60862 If the *socket* argument refers to a connection-mode socket, the *send*( ) function is equivalent to
60863 *sendto*( ) (with any value for the *dest_addr* and *dest_len* arguments, as they are ignored in this
60864 case). If the *socket* argument refers to a socket and the *flags* argument is 0, the *send*( ) function is
60865 equivalent to *write*( ).

60866 **RATIONALE**

60867 None.

60868 **FUTURE DIRECTIONS**

60869 None.

60870 **SEE ALSO**

60871 *connect*( ), *getsockopt*( ), *poll*( ), *pselect*( ), *recv*( ), *recvfrom*( ), *recvmsg*( ), *sendmsg*( ), *sendto*( ),
60872 *setsockopt*( ), *shutdown*( ), *socket*( ), *write*( )

60873 XBD **<sys/socket.h>**

60874 **CHANGE HISTORY**

60875 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

Issue 7

Austin Group Interpretation 1003.1-2001 #035 is applied, updating the DESCRIPTION to clarify the behavior when the socket is a connectionless-mode socket.

The MSG_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The [EPIPE] error is modified.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0543 [463] is applied.

60883 **NAME**

60884 sendmsg — send a message on a socket using a message structure

60885 **SYNOPSIS**

60886 `#include <sys/socket.h>`

60887 `ssize_t sendmsg(int socket, const struct msghdr *message, int flags);`

60888 **DESCRIPTION**

60889 The *sendmsg*( ) function shall send a message through a connection-mode or connectionless-
60890 mode socket. If the socket is a connectionless-mode socket, the message shall be sent to the
60891 address specified by **msghdr** if no pre-specified peer address has been set. If a peer address has
60892 been pre-specified, either the message shall be sent to the address specified in **msghdr**
60893 (overriding the pre-specified peer address), or the function shall return –1 and set *errno* to
60894 [EISCONN]. If the socket is connection-mode, the destination address in **msghdr** shall be
60895 ignored.

60896 The *sendmsg*( ) function takes the following arguments:

60897 *socket* Specifies the socket file descriptor.

60898 *message* Points to a **msghdr** structure, containing both the destination address and the
60899 buffers for the outgoing message. The length and format of the address
60900 depend on the address family of the socket. The *msg_flags* member is ignored.

60901 *flags* Specifies the type of message transmission. The application may specify 0 or
60902 the following flag:

60903 MSG_EOR Terminates a record (if supported by the protocol).

60904 MSG_OOB Sends out-of-band data on sockets that support out-of-
60905 bound data. The significance and semantics of out-of-
60906 band data are protocol-specific.

60907 MSG_NOSIGNAL Requests not to send the SIGPIPE signal if an attempt to
60908 send is made on a stream-oriented socket that is no
60909 longer connected. The [EPIPE] error shall still be
60910 returned.

60911 The *msg_iov* and *msg_iovlen* fields of *message* specify zero or more buffers containing the data to
60912 be sent. *msg_iov* points to an array of **iovec** structures; *msg_iovlen* shall be set to the dimension of
60913 this array. In each **iovec** structure, the *iov_base* field specifies a storage area and the *iov_len* field
60914 gives its size in bytes. Some of these sizes can be zero. The data from each storage area indicated
60915 by *msg_iov* is sent in turn.

60916 Successful completion of a call to *sendmsg*( ) does not guarantee delivery of the message. A
60917 return value of –1 indicates only locally-detected errors.

60918 If space is not available at the sending socket to hold the message to be transmitted and the
60919 socket file descriptor does not have O_NONBLOCK set, the *sendmsg*( ) function shall block until
60920 space is available. If space is not available at the sending socket to hold the message to be
60921 transmitted and the socket file descriptor does have O_NONBLOCK set, the *sendmsg*( ) function
60922 shall fail.

60923 If the socket protocol supports broadcast and the specified address is a broadcast address for the
60924 socket protocol, *sendmsg*( ) shall fail if the SO_BROADCAST option is not set for the socket.

60925 The socket in use may require the process to have appropriate privileges to use the *sendmsg*( )
60926 function.

60927 **RETURN VALUE**

60928 Upon successful completion, *sendmsg*( ) shall return the number of bytes sent. Otherwise, –1
60929 shall be returned and *errno* set to indicate the error.

60930 **ERRORS**

60931 The *sendmsg*( ) function shall fail if:

60932 [EAGAIN] or [EWOULDBLOCK]
60933 The socket's file descriptor is marked O_NONBLOCK and the requested
60934 operation would block.

60935 [EAFNOSUPPORT]
60936 Addresses in the specified address family cannot be used with this socket.

60937 [EBADF] The *socket* argument is not a valid file descriptor.

60938 [ECONNRESET] A connection was forcibly closed by a peer.

60939 [EINTR] A signal interrupted *sendmsg*( ) before any data was transmitted.

60940 [EINVAL] The sum of the *iov_len* values overflows an **ssize_t**.

60941 [EMSGSIZE] The message is too large to be sent all at once (as the socket requires), or the
60942 *msg_iovlen* member of the **msghdr** structure pointed to by *message* is less than
60943 or equal to 0 or is greater than {IOV_MAX}.

60944 [ENOTCONN] The socket is connection-mode but is not connected.

60945 [ENOTSOCK] The *socket* argument does not refer to a socket.

60946 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or
60947 more of the values set in *flags*.

60948 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is
60949 no longer connected. In the latter case, and if the socket is of type
60950 SOCK_STREAM or SOCK_SEQPACKET and the MSG_NOSIGNAL flag is not
60951 set, the SIGPIPE signal is generated to the calling thread.

60952 If the address family of the socket is AF_UNIX, then *sendmsg*( ) shall fail if:

60953 [EIO] An I/O error occurred while reading from or writing to the file system.

60954 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname
60955 in the socket address.

60956 [ENAMETOOLONG]
60957 The length of a component of a pathname is longer than {NAME_MAX}.

60958 [ENOENT] A component of the pathname does not name an existing file or the path name
60959 is an empty string.

60960 [ENOTDIR] A component of the path prefix of the pathname in the socket address names
60961 an existing file that is neither a directory nor a symbolic link to a directory, or
60962 the pathname in the socket address contains at least one non-<slash> character
60963 and ends with one or more trailing <slash> characters and the last pathname
60964 component names an existing file that is neither a directory nor a symbolic
60965 link to a directory.

The *sendmsg*( ) function may fail if:

[EACCES] Search permission is denied for a component of the path prefix; or write access to the named socket is denied.

[EDESTADDRREQ] The socket is not connection-mode and does not have its peer address set, and no destination address was specified.

[EHOSTUNREACH] The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).

[EIO] An I/O error occurred while reading from or writing to the file system.

[EISCONN] A destination address was specified and the socket is already connected.

[ENETDOWN] The local network interface used to reach the destination is down.

[ENETUNREACH] No route to the network is present.

[ENOBUFS] Insufficient resources were available in the system to perform the operation.

[ENOMEM] Insufficient memory was available to fulfill the request.

If the address family of the socket is AF_UNIX, then *sendmsg*( ) may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in the socket address.

[ENAMETOOLONG] The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

Done.

APPLICATION USAGE

The *select*( ) and *poll*( ) functions can be used to determine when it is possible to send more data.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #073 is applied, updating the DESCRIPTION.

Austin Group Interpretation 1003.1-2001 #143 is applied.

The MSG_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The [EPIPE] error is modified.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0544 [324] is applied.

61012 **NAME**

61013 sendto ‡'send a message on a socket

61014 **SYNOPSIS**

61015 ```
#include <sys/socket.h>

ssize_t sendto(int socket, const void *message, size_t length,
    int flags, const struct sockaddr *dest_addr,
    socklen_t dest_len);
```

61019 **DESCRIPTION**

61020 The *sendto*( ) function shall send a message through a connection-mode or connectionless-mode
61021 socket.

61022 If the socket is a connectionless-mode socket, the message shall be sent to the address specified
61023 by *dest_addr* if no pre-specified peer address has been set. If a peer address has been pre-
61024 specified, either the message shall be sent to the address specified by *dest_addr* (overriding the
61025 pre-specified peer address), or the function shall return −1 and set *errno* to [EISCONN].

61026 If the socket is connection-mode, *dest_addr* shall be ignored.

61027 The *sendto*( ) function takes the following arguments:

61028 *socket* Specifies the socket file descriptor.

61029 *message* Points to a buffer containing the message to be sent.

61030 *length* Specifies the size of the message in bytes.

61031 *flags* Specifies the type of message transmission. Values of this argument are
61032 formed by logically OR'ing zero or more of the following flags:

61033 MSG_EOR Terminates a record (if supported by the protocol).

61034 MSG_OOB Sends out-of-band data on sockets that support out-of-
61035 band data. The significance and semantics of out-of-
61036 band data are protocol-specific.

61037 MSG_NOSIGNAL Requests not to send the SIGPIPE signal if an attempt to
61038 send is made on a stream-oriented socket that is no
61039 longer connected. The [EPIPE] error shall still be
61040 returned.

61041 *dest_addr* Points to a **sockaddr** structure containing the destination address. The length
61042 and format of the address depend on the address family of the socket.

61043 *dest_len* Specifies the length of the **sockaddr** structure pointed to by the *dest_addr*
61044 argument.

61045 If the socket protocol supports broadcast and the specified address is a broadcast address for the
61046 socket protocol, *sendto*( ) shall fail if the SO_BROADCAST option is not set for the socket.

61047 The *dest_addr* argument specifies the address of the target.

61048 The *length* argument specifies the length of the message.

61049 Successful completion of a call to *sendto*( ) does not guarantee delivery of the message. A return
61050 value of −1 indicates only locally-detected errors.

61051 If space is not available at the sending socket to hold the message to be transmitted and the
61052 socket file descriptor does not have O_NONBLOCK set, *sendto*( ) shall block until space is
61053 available. If space is not available at the sending socket to hold the message to be transmitted

  
```

and the socket file descriptor does have O_NONBLOCK set, *sendto*( ) shall fail.

The socket in use may require the process to have appropriate privileges to use the *sendto*( ) function.

RETURN VALUE

Upon successful completion, *sendto*( ) shall return the number of bytes sent. Otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *sendto*( ) function shall fail if:

[EAFNOSUPPORT]
: Addresses in the specified address family cannot be used with this socket.

[EAGAIN] or [EWOULDBLOCK]
: The socket's file descriptor is marked O_NONBLOCK and the requested operation would block.

[EBADF] The *socket* argument is not a valid file descriptor.

[ECONNRESET] A connection was forcibly closed by a peer.

[EINTR] A signal interrupted *sendto*( ) before any data was transmitted.

[EMSGSIZE] The message is too large to be sent all at once, as the socket requires.

[ENOTCONN] The socket is connection-mode but is not connected.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or more of the values set in *flags*.

[EPIPE] The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type SOCK_STREAM or SOCK_SEQPACKET and the MSG_NOSIGNAL flag is not set, the SIGPIPE signal is generated to the calling thread.

If the address family of the socket is AF_UNIX, then *sendto*( ) shall fail if:

[EIO] An I/O error occurred while reading from or writing to the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the pathname in the socket address.

[ENAMETOOLONG]
: The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of the pathname does not name an existing file or the pathname is an empty string.

[ENOTDIR] A component of the path prefix of the pathname in the socket address names an existing file that is neither a directory nor a symbolic link to a directory, or the pathname in the socket address contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

The *sendto*( ) function may fail if:

[EACCES] Search permission is denied for a component of the path prefix; or write access to the named socket is denied.

[EDESTADDRREQ] The socket is not connection-mode and does not have its peer address set, and no destination address was specified.

[EHOSTUNREACH] The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).

[EINVAL] The *dest_len* argument is not a valid length for the address family.

[EIO] An I/O error occurred while reading from or writing to the file system.

[EISCONN] A destination address was specified and the socket is already connected.

[ENETDOWN] The local network interface used to reach the destination is down.

[ENETUNREACH] No route to the network is present.

[ENOBUFS] Insufficient resources were available in the system to perform the operation.

[ENOMEM] Insufficient memory was available to fulfill the request.

If the address family of the socket is AF_UNIX, then *sendto*( ) may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in the socket address.

[ENAMETOOLONG] The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

None.

APPLICATION USAGE

The *select*( ) and *poll*( ) functions can be used to determine when it is possible to send more data.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretations 1003.1-2001 #035 and #073 are applied, updating the [EISCONN] error and the DESCRIPTION.

Austin Group Interpretation 1003.1-2001 #143 is applied, clarifying the [ENAMETOOLONG] error condition.

The MSG_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The [EPIPE] error is modified.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0545 [324] is applied.

61142 **NAME**

61143 setbuf — assign buffering to a stream

61144 **SYNOPSIS**

61145 ```
#include <stdio.h>
```

61146 ```
void setbuf(FILE *restrict stream, char *restrict buf);
```

61147 **DESCRIPTION**

61148 CX The functionality described on this reference page is aligned with the ISO C standard. Any
61149 conflict between the requirements described here and the ISO C standard is unintentional. This
61150 volume of POSIX.1-2017 defers to the ISO C standard.

61151 Except that it returns no value, the function call:

61152 ```
setbuf(stream, buf)
```

61153 shall be equivalent to:

61154 ```
setvbuf(stream, buf, _IOFBF, BUFSIZ)
```

61155 if *buf* is not a null pointer, or to:

61156 ```
setvbuf(stream, buf, _IONBF, BUFSIZ)
```

61157 if *buf* is a null pointer.

61158 **RETURN VALUE**

61159 The *setbuf*( ) function shall not return a value.

61160 **ERRORS**

61161 Although the *setvbuf*( ) interface may set *errno* in defined ways, the value of *errno* after a call to
61162 *setbuf*( ) is unspecified.

61163 **EXAMPLES**

61164 None.

61165 **APPLICATION USAGE**

61166 A common source of error is allocating buffer space as an ``automatic'' variable in a code block,
61167 and then failing to close the stream in the same block.

61168 With *setbuf*( ), allocating a buffer of BUFSIZ bytes does not necessarily imply that all of BUFSIZ
61169 bytes are used for the buffer area.

61170 Since *errno* is not required to be unchanged on success, in order to correctly detect and possibly
61171 recover from errors, applications should use *setvbuf*( ) instead of *setbuf*( ).

61172 **RATIONALE**

61173 None.

61174 **FUTURE DIRECTIONS**

61175 None.

61176 **SEE ALSO**

61180 First released in Issue 1. Derived from Issue 1 of the SVID.

  
```

Issue 6

The prototype for *setbuf*( ) is updated for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0546 [397], XSH/TC1-2008/0547 [397], and XSH/TC1-2008/0548 [14] are applied.

61186 **NAME**

61187 setegid — set the effective group ID

61188 **SYNOPSIS**

61189 `#include <unistd.h>`

61190 `int setegid(gid_t gid);`

61191 **DESCRIPTION**

61192 If *gid* is equal to the real group ID or the saved set-group-ID, or if the process has appropriate
61193 privileges, *setegid*( ) shall set the effective group ID of the calling process to *gid*; the real group
61194 ID, saved set-group-ID, and any supplementary group IDs shall remain unchanged.

61195 The *setegid*( ) function shall not affect the supplementary group list in any way.

61196 **RETURN VALUE**

61197 Upon successful completion, 0 shall be returned; otherwise, −1 shall be returned and *errno* set to
61198 indicate the error.

61199 **ERRORS**

61200 The *setegid*( ) function shall fail if:

61201 [EINVAL] The value of the *gid* argument is invalid and is not supported by the
61202 implementation.

61203 [EPERM] The process does not have appropriate privileges and *gid* does not match the
61204 real group ID or the saved set-group-ID.

61205 **EXAMPLES**

61206 None.

61207 **APPLICATION USAGE**

61208 None.

61216 **CHANGE HISTORY**

61217 First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

NAME

setenv — add or change environment variable

SYNOPSIS

CX
```
#include <stdlib.h>

int setenv(const char *envname, const char *envval, int overwrite);
```

DESCRIPTION

The *setenv*( ) function shall update or add a variable in the environment of the calling process. The *envname* argument points to a string containing the name of an environment variable to be added or altered. The environment variable shall be set to the value to which *envval* points. The function shall fail if *envname* points to a string which contains an '=' character. If the environment variable named by *envname* already exists and the value of *overwrite* is non-zero, the function shall return success and the environment shall be updated. If the environment variable named by *envname* already exists and the value of *overwrite* is zero, the function shall return success and the environment shall remain unchanged.

The *setenv*( ) function shall update the list of pointers to which *environ* points.

The strings described by *envname* and *envval* are copied by this function.

The *setenv*( ) function need not be thread-safe.

RETURN VALUE

Upon successful completion, zero shall be returned. Otherwise, –1 shall be returned, *errno* set to indicate the error, and the environment shall be unchanged.

ERRORS

The *setenv*( ) function shall fail if:

[EINVAL] The *envname* argument points to an empty string or points to a string containing an '=' character.

[ENOMEM] Insufficient memory was available to add a variable or its value to the environment.

EXAMPLES

None.

APPLICATION USAGE

See *exec*( ) for restrictions on changing the environment in multi-threaded applications.

RATIONALE

Unanticipated results may occur if *setenv*( ) changes the external variable *environ*. In particular, if the optional *envp* argument to *main*( ) is present, it is not changed, and thus may point to an obsolete copy of the environment (as may any other copy of *environ*). However, other than the aforementioned restriction, the standard developers intended that the traditional method of walking through the environment by way of the *environ* pointer must be supported.

It was decided that *setenv*( ) should be required by this version because it addresses a piece of missing functionality, and does not impose a significant burden on the implementor.

There was considerable debate as to whether the System V *putenv*( ) function or the BSD *setenv*( ) function should be required as a mandatory function. The *setenv*( ) function was chosen because it permitted the implementation of the *unsetenv*( ) function to delete environmental variables, without specifying an additional interface. The *putenv*( ) function is available as part of the XSI option.

The standard developers considered requiring that *setenv*( ) indicate an error when a call to it would result in exceeding {ARG_MAX}. The requirement was rejected since the condition might be temporary, with the application eventually reducing the environment size. The ultimate success or failure depends on the size at the time of a call to *exec*, which returns an indication of this error condition.

See also the RATIONALE section in *getenv*( ).

FUTURE DIRECTIONS

None.

61312 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/123 is applied, making an editorial
61313 correction to the [EPERM] error in the ERRORS section.

NAME

setgid — set-group-ID

SYNOPSIS

```
#include <unistd.h>

int setgid(gid_t gid);
```

DESCRIPTION

If the process has appropriate privileges, *setgid*( ) shall set the real group ID, effective group ID, and the saved set-group-ID of the calling process to *gid*.

If the process does not have appropriate privileges, but *gid* is equal to the real group ID or the saved set-group-ID, *setgid*( ) shall set the effective group ID to *gid*; the real group ID and saved set-group-ID shall remain unchanged.

The *setgid*( ) function shall not affect the supplementary group list in any way.

Any supplementary group IDs of the calling process shall remain unchanged.

RETURN VALUE

Upon successful completion, 0 is returned. Otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *setgid*( ) function shall fail if:

[EINVAL] The value of the *gid* argument is invalid and is not supported by the implementation.

[EPERM] The process does not have appropriate privileges and *gid* does not match the real group ID or the saved set-group-ID.

EXAMPLES

XBD **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

> The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

Functionality associated with _POSIX_SAVED_IDS is now mandated. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

The effects of *setgid*( ) in processes without appropriate privileges are changed.

A requirement that the supplementary group list is not affected is added.

61361 **NAME**

61362 setgrent — reset the group database to the first entry

61363 **SYNOPSIS**

61364 XSI
```
#include <grp.h>

void setgrent(void);
```

61366 **DESCRIPTION**

61367 Refer to *endgrent( )*.

61368 **NAME**

61369 sethostent ‡′network host database functions

61370 **SYNOPSIS**

61371 `#include <netdb.h>`

61372 `void sethostent(int` *`stayopen`*`);`

61373 **DESCRIPTION**

61374 Refer to *endhostent( )*.

61375 **NAME**

61376 setitimer ‡'set the value of an interval timer

61377 **SYNOPSIS**

61378 OB XSI
```
#include <sys/time.h>

int setitimer(int which, const struct itimerval *restrict value,
    struct itimerval *restrict ovalue);
```

61381 **DESCRIPTION**

61382 Refer to *getitimer( )*.

NAME

setjmp ‡'set jump point for a non-local goto

SYNOPSIS

```
#include <setjmp.h>

int setjmp(jmp_buf env);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

A call to *setjmp*( ) shall save the calling environment in its *env* argument for later use by *longjmp*( ).

It is unspecified whether *setjmp*( ) is a macro or a function. If a macro definition is suppressed in order to access an actual function, or a program defines an external identifier with the name *setjmp*, the behavior is undefined.

An application shall ensure that an invocation of *setjmp*( ) appears in one of the following contexts only:

- The entire controlling expression of a selection or iteration statement
- One operand of a relational or equality operator with the other operand an integral constant expression, with the resulting expression being the entire controlling expression of a selection or iteration statement
- The operand of a unary '!' operator with the resulting expression being the entire controlling expression of a selection or iteration
- The entire expression of an expression statement (possibly cast to **void**)

If the invocation appears in any other context, the behavior is undefined.

RETURN VALUE

If the return is from a direct invocation, *setjmp*( ) shall return 0. If the return is from a call to *longjmp*( ), *setjmp*( ) shall return a non-zero value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

In general, *sigsetjmp*( ) is more useful in dealing with errors and interrupts encountered in a low-level subroutine of a program.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

longjmp( ), *sigsetjmp*( )

XBD **<setjmp.h>**

61424 **CHANGE HISTORY**

61425 First released in Issue 1. Derived from Issue 1 of the SVID.

61426 **Issue 6**

61427 The normative text is updated to avoid use of the term ``must'' for application requirements.

NAME

setkey ‡'set encoding key (**CRYPT**)

SYNOPSIS

XSI
```
#include <stdlib.h>

void setkey(const char *key);
```

DESCRIPTION

The *setkey*( ) function provides access to an implementation-defined encoding algorithm. The argument of *setkey*( ) is an array of length 64 bytes containing only the bytes with numerical value of 0 and 1. If this string is divided into groups of 8, the low-order bit in each group is ignored; this gives a 56-bit key which is used by the algorithm. This is the key that shall be used with the algorithm to encode a string *block* passed to *encrypt*( ).

The *setkey*( ) function shall not change the setting of *errno* if successful. An application wishing to check for error situations should set *errno* to 0 before calling *setkey*( ). If *errno* is non-zero on return, an error has occurred.

The *setkey*( ) function need not be thread-safe.

RETURN VALUE

No values are returned.

ERRORS

The *setkey*( ) function shall fail if:

[ENOSYS] The functionality is not supported on this implementation.

EXAMPLES

None.

APPLICATION USAGE

Decoding need not be implemented in all environments. This is related to government restrictions in some countries on encryption and decryption routines. Historical practice has been to ship a different version of the encryption library without the decryption feature in the routines supplied. Thus the exported version of *encrypt*( ) does encoding but not decoding.

RATIONALE

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0320 [899] is applied.

NAME

setlocale — set program locale

SYNOPSIS

```
#include <locale.h>

char *setlocale(int category, const char *locale);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *setlocale*( ) function selects the appropriate piece of the global locale, as specified by the *category* and *locale* arguments, and can be used to change or query the entire global locale or portions thereof. The value LC_ALL for *category* names the entire global locale; other values for *category* name only a part of the global locale:

LC_COLLATE Affects the behavior of regular expressions and the collation functions.

LC_CTYPE Affects the behavior of regular expressions, character classification, character conversion functions, and wide-character functions.

CX LC_MESSAGES Affects the affirmative and negative response expressions returned by *nl_langinfo*( ) and the way message catalogs are located. It may also affect the behavior of functions that return or write message strings.

LC_MONETARY Affects the behavior of functions that handle monetary values.

LC_NUMERIC Affects the behavior of functions that handle numeric values.

LC_TIME Affects the behavior of the time conversion functions.

The *locale* argument is a pointer to a character string containing the required setting of *category*. The contents of this string are implementation-defined. In addition, the following preset values of *locale* are defined for all settings of *category*:

CX "POSIX" Specifies the minimal environment for C-language translation called the POSIX locale. The POSIX locale is the default global locale at entry to *main*( ).

"C" Equivalent to "POSIX".

CX "" Specifies an implementation-defined native environment. The determination of the name of the new locale for the specified category depends on the value of the associated environment variables, *LC_** and *LANG*; see XBD Chapter 7 (on page 135) and Chapter 8 (on page 173).

A null pointer Directs *setlocale*( ) to query the current global locale setting and return the name of the locale if *category* is not LC_ALL, or a string which encodes the locale name(s) for all of the individual categories if *category* is LC_ALL.

CX Setting all of the categories of the global locale is similar to successively setting each individual category of the global locale, except that all error checking is done before any actions are performed. To set all the categories of the global locale, *setlocale*( ) can be invoked as:

```
setlocale(LC_ALL, "");
```

In this case, *setlocale*( ) shall first verify that the values of all the environment variables it needs according to the precedence rules (described in XBD Chapter 8, on page 173) indicate supported locales. If the value of any of these environment variable searches yields a locale that is not supported (and non-null), *setlocale*( ) shall return a null pointer and the global locale shall not be

changed. If all environment variables name supported locales, *setlocale*( ) shall proceed as if it had been called for each category, using the appropriate value from the associated environment variable or from the implementation-defined default if there is no such value.

The global locale established using *setlocale*( ) shall only be used in threads for which no current locale has been set using *uselocale*( ) or whose current locale has been set to the global locale using *uselocale*(LC_GLOBAL_LOCALE).

The implementation shall behave as if no function defined in this volume of POSIX.1-2017 calls *setlocale*( ).

CX The *setlocale*( ) function need not be thread-safe.

RETURN VALUE

Upon successful completion, *setlocale*( ) shall return the string associated with the specified category for the new locale. Otherwise, *setlocale*( ) shall return a null pointer and the global locale shall not be changed.

A null pointer for *locale* shall cause *setlocale*( ) to return a pointer to the string associated with the specified *category* for the current global locale. The global locale shall not be changed.

The string returned by *setlocale*( ) is such that a subsequent call with that string and its associated *category* shall restore that part of the global locale. The application shall not modify the string returned. CX The returned string pointer might be invalidated or the string content might be overwritten by a subsequent call to *setlocale*( ). CX The returned pointer might also be invalidated if the calling thread is terminated.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The following code illustrates how a program can initialize the international environment for one language, while selectively modifying the global locale such that regular expressions and string operations can be applied to text recorded in a different language:

```
setlocale(LC_ALL, "De");
setlocale(LC_COLLATE, "Fr@dict");
```

Internationalized programs can initiate language operation according to environment variable settings (see XBD Section 8.2, on page 174) by calling *setlocale*( ) as follows:

```
setlocale(LC_ALL, "");
```

Changing the setting of *LC_MESSAGES* has no effect on catalogs that have already been opened by calls to *catopen*( ).

In order to make use of different locale settings while multiple threads are running, applications should use *uselocale*( ) in preference to *setlocale*( ).

RATIONALE

References to the international environment or locale in the following text relate to the global locale for the process. This can be overridden for individual threads using *uselocale*( ).

The ISO C standard defines a collection of functions to support internationalization. One of the most significant aspects of these functions is a facility to set and query the *international environment*. The international environment is a repository of information that affects the behavior of certain functionality, namely:

1. Character handling
2. Collating
3. Date/time formatting
4. Numeric editing
5. Monetary formatting
6. Messaging

The *setlocale*( ) function provides the application developer with the ability to set all or portions, called *categories*, of the international environment. These categories correspond to the areas of functionality mentioned above. The syntax for *setlocale*( ) is as follows:

```
char *setlocale(int category, const char *locale);
```

where *category* is the name of one of following categories, namely:

LC_COLLATE
LC_CTYPE
LC_MESSAGES
LC_MONETARY
LC_NUMERIC
LC_TIME

In addition, a special value called LC_ALL directs *setlocale*( ) to set all categories.

There are two primary uses of *setlocale*( ):

1. Querying the international environment to find out what it is set to
2. Setting the international environment, or *locale*, to a specific value

The behavior of *setlocale*( ) in these two areas is described below. Since it is difficult to describe the behavior in words, examples are used to illustrate the behavior of specific uses.

To query the international environment, *setlocale*( ) is invoked with a specific category and the null pointer as the locale. The null pointer is a special directive to *setlocale*( ) that tells it to query rather than set the international environment. The following syntax is used to query the name of the international environment:

```
setlocale({LC_ALL, LC_COLLATE, LC_CTYPE, LC_MESSAGES, LC_MONETARY, \
    LC_NUMERIC, LC_TIME},(char *) NULL);
```

The *setlocale*( ) function shall return the string corresponding to the current international environment. This value may be used by a subsequent call to *setlocale*( ) to reset the international environment to this value. However, it should be noted that the return value from *setlocale*( ) may be a pointer to a static area within the function and is not guaranteed to remain unchanged (that is, it may be modified by a subsequent call to *setlocale*( )). Therefore, if the purpose of calling *setlocale*( ) is to save the value of the current international environment so it can be changed and reset later, the return value should be copied to an array of **char** in the calling program.

There are three ways to set the international environment with *setlocale*( ):

setlocale(*category*, *string*)
: This usage sets a specific *category* in the international environment to a specific value corresponding to the value of the *string*. A specific example is provided below:

```
setlocale(LC_ALL, "fr_FR.ISO-8859-1");
```

In this example, all categories of the international environment are set to the locale corresponding to the string "fr_FR.ISO-8859-1", or to the French language as spoken in France using the ISO/IEC 8859-1: 1998 standard codeset.

If the string does not correspond to a valid locale, *setlocale*( ) shall return a null pointer and the international environment is not changed. Otherwise, *setlocale*( ) shall return the name of the locale just set.

setlocale(*category*, "C")
The ISO C standard states that one locale must exist on all conforming implementations. The name of the locale is C and corresponds to a minimal international environment needed to support the C programming language.

setlocale(*category*, "")
This sets a specific category to an implementation-defined default. This corresponds to the value of the environment variables.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

Extensions beyond the ISO C standard are marked.

The normative text is updated to avoid use of the term ``must'' for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/124 is applied, updating the DESCRIPTION to clarify the behavior of:

```
setlocale(LC_ALL, "");
```

Issue 7

Functionality relating to the Threads option is moved to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0553 [302], XSH/TC1-2008/0554 [303], XSH/TC1-2008/0555 [302], XSH/TC1-2008/0556 [302], XSH/TC1-2008/0557 [302], XSH/TC1-2008/0558 [302], XSH/TC1-2008/0559 [302], XSH/TC1-2008/0560 [288], XSH/TC1-2008/0561 [302], XSH/TC1-2008/0562 [302], XSH/TC1-2008/0563 [302], XSH/TC1-2008/0564 [302], XSH/TC1-2008/0565 [302], XSH/TC1-2008/0566 [302], XSH/TC1-2008/0567 [288], XSH/TC1-2008/0568 [288], and XSH/TC1-2008/0569 [303] are applied.

61640 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0321 [826], XSH/TC2-2008/0322 [826],
61641 and XSH/TC2-2008/0323 [596] are applied.

61642 **NAME**

61643 setlogmask ‡′set the log priority mask

61644 **SYNOPSIS**

61645 XSI
```
#include <syslog.h>

int setlogmask(int maskpri);
```

61646

61647 **DESCRIPTION**

61648 Refer to *closelog( )*.

61649 **NAME**

61650 setnetent ‡′network database function

61651 **SYNOPSIS**

61652 `#include <netdb.h>`

61653 `void setnetent(int stayopen);`

61654 **DESCRIPTION**

61655 Refer to *endnetent( )*.

61656 **NAME**

61657 setpgid — set process group ID for job control

61658 **SYNOPSIS**

61659 `#include <unistd.h>`

61660 `int setpgid(pid_t pid, pid_t pgid);`

61661 **DESCRIPTION**

61662 The *setpgid*( ) function shall either join an existing process group or create a new process group
61663 within the session of the calling process.

61664 The process group ID of a session leader shall not change.

61665 Upon successful completion, the process group ID of the process with a process ID that matches
61666 *pid* shall be set to *pgid*.

61667 As a special case, if *pid* is 0, the process ID of the calling process shall be used. Also, if *pgid* is 0,
61668 the process ID of the indicated process shall be used.

61669 **RETURN VALUE**

61670 Upon successful completion, *setpgid*( ) shall return 0; otherwise, −1 shall be returned and *errno*
61671 shall be set to indicate the error.

61672 **ERRORS**

61673 The *setpgid*( ) function shall fail if:

61674 [EACCES] The value of the *pid* argument matches the process ID of a child process of the
61675 calling process and the child process has successfully executed one of the *exec*
61676 functions.

61677 [EINVAL] The value of the *pgid* argument is less than 0, or is not a value supported by
61678 the implementation.

61679 [EPERM] The process indicated by the *pid* argument is a session leader.

61680 [EPERM] The value of the *pid* argument matches the process ID of a child process of the
61681 calling process and the child process is not in the same session as the calling
61682 process.

61683 [EPERM] The value of the *pgid* argument is valid but does not match the process ID of
61684 the process indicated by the *pid* argument and there is no process with a
61685 process group ID that matches the value of the *pgid* argument in the same
61686 session as the calling process.

61687 [ESRCH] The value of the *pid* argument does not match the process ID of the calling
61688 process or of a child process of the calling process.

61689 **EXAMPLES**

61690 None.

61691 **APPLICATION USAGE**

61692 None.

61693 **RATIONALE**

61694 The *setpgid*( ) function shall group processes together for the purpose of signaling, placement in
61695 foreground or background, and other job control actions.

61696 The *setpgid*( ) function is similar to the *setpgrp*( ) function of 4.2 BSD, except that 4.2 BSD allowed
61697 the specified new process group to assume any value. This presents certain security problems
61698 and is more flexible than necessary to support job control.

To provide tighter security, *setpgid*( ) only allows the calling process to join a process group already in use inside its session or create a new process group whose process group ID was equal to its process ID.

When a job control shell spawns a new job, the processes in the job must be placed into a new process group via *setpgid*( ). There are two timing constraints involved in this action:

1. The new process must be placed in the new process group before the appropriate program is launched via one of the *exec* functions.
2. The new process must be placed in the new process group before the shell can correctly send signals to the new process group.

To address these constraints, the following actions are performed. The new processes call *setpgid*( ) to alter their own process groups after *fork*( ) but before *exec*. This satisfies the first constraint. Under 4.3 BSD, the second constraint is satisfied by the synchronization property of *vfork*( ); that is, the shell is suspended until the child has completed the *exec*, thus ensuring that the child has completed the *setpgid*( ). A new version of *fork*( ) with this same synchronization property was considered, but it was decided instead to merely allow the parent shell process to adjust the process group of its child processes via *setpgid*( ). Both timing constraints are now satisfied by having both the parent shell and the child attempt to adjust the process group of the child process; it does not matter which succeeds first.

Since it would be confusing to an application to have its process group change after it began executing (that is, after *exec*), and because the child process would already have adjusted its process group before this, the [EACCES] error was added to disallow this.

One non-obvious use of *setpgid*( ) is to allow a job control shell to return itself to its original process group (the one in effect when the job control shell was executed). A job control shell does this before returning control back to its parent when it is terminating or suspending itself as a way of restoring its job control ``state'' back to what its parent would expect. (Note that the original process group of the job control shell typically matches the process group of its parent, but this is not necessarily always the case.)

FUTURE DIRECTIONS

None.

SEE ALSO

exec, *getpgrp*( ), *setsid*( ), *tcsetpgrp*( )

XBD **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

> The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
>
> The *setpgid*( ) function is mandatory since _POSIX_JOB_CONTROL is required to be defined in this version. This is a FIPS requirement.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/56 is applied, changing the wording in the DESCRIPTION from ``the process group ID of the indicated process shall be used'' to ``the process ID of the indicated process shall be used''. This change reverts the wording to as in the ISO POSIX-1: 1996 standard; it appeared to be an unintentional change.

NAME

setpgrp — set the process group ID

SYNOPSIS

OB XSI
```
#include <unistd.h>

pid_t setpgrp(void);
```

DESCRIPTION

If the calling process is not already a session leader, *setpgrp*( ) sets the process group ID of the calling process to the process ID of the calling process. If *setpgrp*( ) creates a new session, then the new session has no controlling terminal.

The *setpgrp*( ) function has no effect when the calling process is a session leader.

RETURN VALUE

Upon completion, *setpgrp*( ) shall return the process group ID.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

It is unspecified whether this function behaves as *setpgid*(0,0) or *setsid*( ) unless the process is already a session leader. Therefore, applications are encouraged to use *setpgid*( ) or *setsid*( ) as appropriate.

RATIONALE

None.

FUTURE DIRECTIONS

The *setpgrp*( ) function may be removed in a future version.

SEE ALSO

exec, *fork*( ), *getpid*( ), *getsid*( ), *kill*( ), *setpgid*( ), *setsid*( )

XBD **<unistd.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 7

The *setpgrp*( ) function is marked obsolescent.

61779 **NAME**

61780 setpriority ‡'set the nice value

61781 **SYNOPSIS**

61782 XSI
```
#include <sys/resource.h>

int setpriority(int which, id_t who, int nice);
```

61784 **DESCRIPTION**

61785 Refer to *getpriority( )*.

61786 **NAME**

61787 setprotoent — network protocol database functions

61788 **SYNOPSIS**

61789 `#include <netdb.h>`

61790 `void setprotoent(int stayopen);`

61791 **DESCRIPTION**

61792 Refer to *endprotoent( )*.

61793 **NAME**

61794 setpwent ‡'user database function

61795 **SYNOPSIS**

61796 XSI
```
#include <pwd.h>

void setpwent(void);
```

61798 **DESCRIPTION**

61799 Refer to *endpwent( )*.

61800 **NAME**

61801 setregid — set real and effective group IDs

61802 **SYNOPSIS**

61803 XSI
```
#include <unistd.h>

int setregid(gid_t rgid, gid_t egid);
```

61804

61805 **DESCRIPTION**

61806 The *setregid*( ) function shall set the real and effective group IDs of the calling process.

61807 If *rgid* is –1, the real group ID shall not be changed; if *egid* is –1, the effective group ID shall not
61808 be changed.

61809 The real and effective group IDs may be set to different values in the same call.

61810 Only a process with appropriate privileges can set the real group ID and the effective group ID
61811 to any valid value.

61812 A non-privileged process can set either the real group ID to the saved set-group-ID from one of
61813 the *exec* family of functions, or the effective group ID to the saved set-group-ID or the real group
61814 ID.

61815 If the real group ID is being set (*rgid* is not –1), or the effective group ID is being set to a value
61816 not equal to the real group ID, then the saved set-group-ID of the current process shall be set
61817 equal to the new effective group ID.

61818 Any supplementary group IDs of the calling process remain unchanged.

61819 **RETURN VALUE**

61820 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
61821 indicate the error, and neither of the group IDs are changed.

61822 **ERRORS**

61823 The *setregid*( ) function shall fail if:

61824 [EINVAL] The value of the *rgid* or *egid* argument is invalid or out-of-range.

61825 [EPERM] The process does not have appropriate privileges and a change other than
61826 changing the real group ID to the saved set-group-ID, or changing the
61827 effective group ID to the real group ID or the saved set-group-ID, was
61828 requested.

61829 **EXAMPLES**

61830 None.

61831 **APPLICATION USAGE**

61832 If a non-privileged set-group-ID process sets its effective group ID to its real group ID, it can
61833 only set its effective group ID back to the previous value if *rgid* was –1 in the *setregid*( ) call, since
61834 the saved-group-ID is not changed in that case. If *rgid* was equal to the real group ID in the
61835 *setregid*( ) call, then the saved set-group-ID will also have been changed to the real user ID.

61836 **RATIONALE**

61837 Earlier versions of this standard did not specify whether the saved set-group-ID was affected by
61838 *setregid*( ) calls. This version specifies common existing practice that constitutes an important
61839 security feature. The ability to set both the effective group ID and saved set-group-ID to be the
61840 same as the real group ID means that any security weakness in code that is executed after that
61841 point cannot result in malicious code being executed with the previous effective group ID.
61842 Privileged applications could already do this using just *setgid*( ), but for non-privileged

61843 applications the only standard method available is to use this feature of *setregid*( ).

61844 **FUTURE DIRECTIONS**

61845 None.

61846 **SEE ALSO**

61847 *exec*, *getegid*( ), *geteuid*( ), *getgid*( ), *getuid*( ), *setegid*( ), *seteuid*( ), *setgid*( ), *setreuid*( ), *setuid*( )

61848 XBD **<unistd.h>**

61849 **CHANGE HISTORY**

61850 First released in Issue 4, Version 2.

61851 **Issue 5**

61852 Moved from X/OPEN UNIX extension to BASE.

61853 The DESCRIPTION is updated to indicate that the saved set-group-ID can be set by any of the
61854 *exec* family of functions, not just *execve*( ).

61855 **Issue 7**

61856 SD5-XSH-ERN-177 is applied, adding the ability to set both the effective group ID and saved set-
61857 group-ID to be the same as the real group ID.

NAME

setreuid — set real and effective user IDs

SYNOPSIS

XSI
```
#include <unistd.h>

int setreuid(uid_t ruid, uid_t euid);
```

DESCRIPTION

The *setreuid*( ) function shall set the real and effective user IDs of the current process to the values specified by the *ruid* and *euid* arguments. If *ruid* or *euid* is –1, the corresponding effective or real user ID of the current process shall be left unchanged.

A process with appropriate privileges can set either ID to any value. An unprivileged process can only set the effective user ID if the *euid* argument is equal to either the real, effective, or saved user ID of the process.

If the real user ID is being set (*ruid* is not –1), or the effective user ID is being set to a value not equal to the real user ID, then the saved set-user-ID of the current process shall be set equal to the new effective user ID.

It is unspecified whether a process without appropriate privileges is permitted to change the real user ID to match the current effective user ID or saved set-user-ID of the process.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *setreuid*( ) function shall fail if:

[EINVAL] The value of the *ruid* or *euid* argument is invalid or out-of-range.

[EPERM] The current process does not have appropriate privileges, and either an attempt was made to change the effective user ID to a value other than the real user ID or the saved set-user-ID or an attempt was made to change the real user ID to a value not permitted by the implementation.

EXAMPLES

Setting the Effective User ID to the Real User ID

The following example sets the effective user ID of the calling process to the real user ID, so that files created later will be owned by the current user. It also sets the saved set-user-ID to the real user ID, so any future attempt to set the effective user ID back to its previous value will fail.

```
#include <unistd.h>
#include <sys/types.h>
...
setreuid(getuid(), getuid());
...
```

APPLICATION USAGE

None.

61897 **RATIONALE**

61898 Earlier versions of this standard did not specify whether the saved set-user-ID was affected by
61899 *setreuid*( ) calls. This version specifies common existing practice that constitutes an important
61900 security feature. The ability to set both the effective user ID and saved set-user-ID to be the same
61901 as the real user ID means that any security weakness in code that is executed after that point
61902 cannot result in malicious code being executed with the previous effective user ID. Privileged
61903 applications could already do this using just *setuid*( ), but for non-privileged applications the
61904 only standard method available is to use this feature of *setreuid*( ).

61905 **FUTURE DIRECTIONS**

61906 None.

61907 **SEE ALSO**

61908 *getegid*( ), *geteuid*( ), *getgid*( ), *getuid*( ), *setegid*( ), *seteuid*( ), *setgid*( ), *setregid*( ), *setuid*( )

61910 **CHANGE HISTORY**

61911 First released in Issue 4, Version 2.

61912 **Issue 5**

61913 Moved from X/OPEN UNIX extension to BASE.

61914 **Issue 7**

61915 SD5-XSH-ERN-177 is applied, adding the ability to set both the effective user ID and the saved
61916 set-user-ID to be the same as the real user ID.

61917 **NAME**

61918 setrlimit — control maximum resource consumption

61919 **SYNOPSIS**

61920 XSI
```
#include <sys/resource.h>

int setrlimit(int resource, const struct rlimit *rlp);
```

61922 **DESCRIPTION**

61923 Refer to *getrlimit( )*.

61924 **NAME**

61925 setservent ‡′network services database functions

61926 **SYNOPSIS**

61927 `#include <netdb.h>`

61928 `void setservent(int stayopen);`

61929 **DESCRIPTION**

61930 Refer to *endservent( )*.

NAME

setsid — create session and set process group ID

SYNOPSIS

```
#include <unistd.h>

pid_t setsid(void);
```

DESCRIPTION

The *setsid*( ) function shall create a new session, if the calling process is not a process group leader. Upon return the calling process shall be the session leader of this new session, shall be the process group leader of a new process group, and shall have no controlling terminal. The process group ID of the calling process shall be set equal to the process ID of the calling process. The calling process shall be the only process in the new process group and the only process in the new session.

RETURN VALUE

Upon successful completion, *setsid*( ) shall return the value of the new process group ID of the calling process. Otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *setsid*( ) function shall fail if:

[EPERM] The calling process is already a process group leader, or the process group ID of a process other than the calling process matches the process ID of the calling process.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *setsid*( ) function is similar to the *setpgrp*( ) function of System V. System V, without job control, groups processes into process groups and creates new process groups via *setpgrp*( ); only one process group may be part of a login session.

Job control allows multiple process groups within a login session. In order to limit job control actions so that they can only affect processes in the same login session, this volume of POSIX.1-2017 adds the concept of a session that is created via *setsid*( ). The *setsid*( ) function also creates the initial process group contained in the session. Additional process groups can be created via the *setpgid*( ) function. A System V process group would correspond to a POSIX System Interfaces session containing a single POSIX process group. Note that this function requires that the calling process not be a process group leader. The usual way to ensure this is true is to create a new process with *fork*( ) and have it call *setsid*( ). The *fork*( ) function guarantees that the process ID of the new process does not match any existing process group ID.

FUTURE DIRECTIONS

None.

61973 **CHANGE HISTORY**

61974 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

61975 **Issue 6**

61976 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

61977 The following new requirements on POSIX implementations derive from alignment with the
61978 Single UNIX Specification:

61979 The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
61980 required for conforming implementations of previous POSIX specifications, it was not
61981 required for UNIX applications.

61982 **Issue 7**

61983 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0570 [421] is applied.

61984 **NAME**

61985 setsockopt ‡'set the socket options

61986 **SYNOPSIS**

61987
```
#include <sys/socket.h>
```

61988
```
int setsockopt(int socket, int level, int option_name,
```
61989
```
    const void *option_value, socklen_t option_len);
```

61990 **DESCRIPTION**

61991 The *setsockopt*( ) function shall set the option specified by the *option_name* argument, at the
61992 protocol level specified by the *level* argument, to the value pointed to by the *option_value*
61993 argument for the socket associated with the file descriptor specified by the *socket* argument.

61994 The *level* argument specifies the protocol level at which the option resides. To set options at the
61995 socket level, specify the *level* argument as SOL_SOCKET. To set options at other levels, supply
61996 the appropriate *level* identifier for the protocol controlling the option. For example, to indicate
61997 that an option is interpreted by the TCP (Transport Control Protocol), set *level* to IPPROTO_TCP
61998 as defined in the **<netinet/in.h>** header.

61999 The *option_name* argument specifies a single option to set. It can be one of the socket-level
62000 options defined in **<sys/socket.h>** and described in Section 2.10.16 (on page 528). If *option_name*
62001 is equal to SO_RCVTIMEO or SO_SNDTIMEO and the implementation supports setting the
62002 option, it is unspecified whether the **struct timeval** pointed to by *option_value* is stored as
62003 provided by this function or is rounded up to align with the resolution of the clock being used. If
62004 *setsockopt*( ) is called with *option_name* equal to SO_ACCEPTCONN, SO_ERROR, or SO_TYPE,
62005 the behavior is unspecified.

62006 **RETURN VALUE**

62007 Upon successful completion, *setsockopt*( ) shall return 0. Otherwise, –1 shall be returned and
62008 *errno* set to indicate the error.

62009 **ERRORS**

62010 The *setsockopt*( ) function shall fail if:

62011 [EBADF] The *socket* argument is not a valid file descriptor.

62012 [EDOM] The send and receive timeout values are too big to fit into the timeout fields in
62013 the socket structure.

62014 [EINVAL] The specified option is invalid at the specified socket level or the socket has
62015 been shut down.

62016 [EISCONN] The socket is already connected, and a specified option cannot be set while the
62017 socket is connected.

62018 [ENOPROTOOPT]
62019 The option is not supported by the protocol.

62020 [ENOTSOCK] The *socket* argument does not refer to a socket.

62021 The *setsockopt*( ) function may fail if:

62022 [ENOMEM] There was insufficient memory available for the operation to complete.

62023 [ENOBUFS] Insufficient resources are available in the system to complete the call.

EXAMPLES

None.

APPLICATION USAGE

The *setsockopt*( ) function provides an application program with the means to control socket behavior. An application program can use *setsockopt*( ) to allocate buffer space, control timeouts, or permit socket data broadcasts. The **<sys/socket.h>** header defines the socket-level options available to *setsockopt*( ).

Options may exist at multiple protocol levels. The SO_ options are always present at the uppermost socket level.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/125 is applied, updating the SO_LINGER option in the DESCRIPTION to refer to the calling thread rather than the process.

Issue 7

Austin Group Interpretation 1003.1-2001 #158 is applied, removing text relating to socket options that is now in Section 2.10.16 (on page 528).

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0571 [369] is applied.

62048 **NAME**

62049 setstate ‡'switch pseudo-random number generator state arrays

62050 **SYNOPSIS**

62051 XSI
```
#include <stdlib.h>

char *setstate(char *state);
```
62052

62053 **DESCRIPTION**

62054 Refer to *initstate( )*.

62055 **NAME**

62056 setuid ‡'set user ID

62057 **SYNOPSIS**

62058 `#include <unistd.h>`

62059 `int setuid(uid_t uid);`

62060 **DESCRIPTION**

62061 If the process has appropriate privileges, *setuid*( ) shall set the real user ID, effective user ID, and
62062 the saved set-user-ID of the calling process to *uid*.

62063 If the process does not have appropriate privileges, but *uid* is equal to the real user ID or the
62064 saved set-user-ID, *setuid*( ) shall set the effective user ID to *uid*; the real user ID and saved set-
62065 user-ID shall remain unchanged.

62066 The *setuid*( ) function shall not affect the supplementary group list in any way.

62067 **RETURN VALUE**

62068 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
62069 indicate the error.

62070 **ERRORS**

62071 The *setuid*( ) function shall fail, return –1, and set *errno* to the corresponding value if one or more
62072 of the following are true:

62073 [EINVAL] The value of the *uid* argument is invalid and not supported by the
62074 implementation.

62075 [EPERM] The process does not have appropriate privileges and *uid* does not match the
62076 real user ID or the saved set-user-ID.

62077 **EXAMPLES**

62078 None.

62079 **APPLICATION USAGE**

62080 None.

62081 **RATIONALE**

62082 The various behaviors of the *setuid*( ) and *setgid*( ) functions when called by non-privileged
62083 processes reflect the behavior of different historical implementations. For portability, it is
62084 recommended that new non-privileged applications use the *seteuid*( ) and *setegid*( ) functions
62085 instead.

62086 The saved set-user-ID capability allows a program to regain the effective user ID established at
62087 the last *exec* call. Similarly, the saved set-group-ID capability allows a program to regain the
62088 effective group ID established at the last *exec* call. These capabilities are derived from System V.
62089 Without them, a program might have to run as superuser in order to perform the same
62090 functions, because superuser can write on the user's files. This is a problem because such a
62091 program can write on any user's files, and so must be carefully written to emulate the
62092 permissions of the calling process properly. In System V, these capabilities have traditionally
62093 been implemented only via the *setuid*( ) and *setgid*( ) functions for non-privileged processes. The
62094 fact that the behavior of those functions was different for privileged processes made them
62095 difficult to use. The POSIX.1-1990 standard defined the *setuid*( ) function to behave differently
62096 for privileged and unprivileged users. When the caller had appropriate privileges, the function
62097 set the real user ID, effective user ID, and saved set-user ID of the calling process on
62098 implementations that supported it. When the caller did not have appropriate privileges, the
62099 function set only the effective user ID, subject to permission checks. The former use is generally
62100 needed for utilities like *login* and *su*, which are not conforming applications and thus outside the

scope of POSIX.1-2017. These utilities wish to change the user ID irrevocably to a new value, generally that of an unprivileged user. The latter use is needed for conforming applications that are installed with the set-user-ID bit and need to perform operations using the real user ID.

POSIX.1-2017 augments the latter functionality with a mandatory feature named _POSIX_SAVED_IDS. This feature permits a set-user-ID application to switch its effective user ID back and forth between the values of its *exec*-time real user ID and effective user ID. Unfortunately, the POSIX.1-1990 standard did not permit a conforming application using this feature to work properly when it happened to be executed with (implementation-defined) appropriate privileges. Furthermore, the application did not even have a means to tell whether it had this privilege. Since the saved set-user-ID feature is quite desirable for applications, as evidenced by the fact that NIST required it in FIPS 151-2, it has been mandated by POSIX.1-2017. However, there are implementors who have been reluctant to support it given the limitation described above.

The 4.3BSD system handles the problem by supporting separate functions: *setuid*( ) (which always sets both the real and effective user IDs, like *setuid*( ) in POSIX.1-2017 for privileged users), and *seteuid*( ) (which always sets just the effective user ID, like *setuid*( ) in POSIX.1-2017 for non-privileged users). This separation of functionality into distinct functions seems desirable. 4.3BSD does not support the saved set-user-ID feature. It supports similar functionality of switching the effective user ID back and forth via *setreuid*( ), which permits reversing the real and effective user IDs. This model seems less desirable than the saved set-user-ID because the real user ID changes as a side-effect. The current 4.4BSD includes saved effective IDs and uses them for *seteuid*( ) and *setegid*( ) as described above. The *setreuid*( ) and *setregid*( ) functions will be deprecated or removed.

The solution here is:

> Require that all implementations support the functionality of the saved set-user-ID, which is set by the *exec* functions and by privileged calls to *setuid*( ).
>
> Add the *seteuid*( ) and *setegid*( ) functions as portable alternatives to *setuid*( ) and *setgid*( ) for non-privileged and privileged processes.

Historical systems have provided two mechanisms for a set-user-ID process to change its effective user ID to be the same as its real user ID in such a way that it could return to the original effective user ID: the use of the *setuid*( ) function in the presence of a saved set-user-ID, or the use of the BSD *setreuid*( ) function, which was able to swap the real and effective user IDs. The changes included in POSIX.1-2017 provide a new mechanism using *seteuid*( ) in conjunction with a saved set-user-ID. Thus, all implementations with the new *seteuid*( ) mechanism will have a saved set-user-ID for each process, and most of the behavior controlled by _POSIX_SAVED_IDS has been changed to agree with the case where the option was defined. The *kill*( ) function is an exception. Implementors of the new *seteuid*( ) mechanism will generally be required to maintain compatibility with the older mechanisms previously supported by their systems. However, compatibility with this use of *setreuid*( ) and with the _POSIX_SAVED_IDS behavior of *kill*( ) is unfortunately complicated. If an implementation with a saved set-user-ID allows a process to use *setreuid*( ) to swap its real and effective user IDs, but were to leave the saved set-user-ID unmodified, the process would then have an effective user ID equal to the original real user ID, and both real and saved set-user-ID would be equal to the original effective user ID. In that state, the real user would be unable to kill the process, even though the effective user ID of the process matches that of the real user, if the *kill*( ) behavior of _POSIX_SAVED_IDS was used. This is obviously not acceptable. The alternative choice, which is used in at least one implementation, is to change the saved set-user-ID to the effective user ID during most calls to *setreuid*( ). The standard developers considered that alternative to be less correct than the retention of the old behavior of *kill*( ) in such systems. Current conforming applications shall

accommodate either behavior from *kill*( ), and there appears to be no strong reason for *kill*( ) to check the saved set-user-ID rather than the effective user ID.

FUTURE DIRECTIONS

None.

XBD **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The functionality associated with _POSIX_SAVED_IDS is now mandatory. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effects of *setuid*( ) in processes without appropriate privileges are changed.
- A requirement that the supplementary group list is not affected is added.

62171 **NAME**

62172 setutxent — reset the user accounting database to the first entry

62173 **SYNOPSIS**

62174 XSI
```
#include <utmpx.h>

void setutxent(void);
```

62176 **DESCRIPTION**

62177 Refer to *endutxent( )*.

NAME

setvbuf — assign buffering to a stream

SYNOPSIS

```
#include <stdio.h>

int setvbuf(FILE *restrict stream, char *restrict buf, int type,
    size_t size);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *setvbuf*( ) function may be used after the stream pointed to by *stream* is associated with an open file but before any other operation (other than an unsuccessful call to *setvbuf*( )) is performed on the stream. The argument *type* determines how *stream* shall be buffered, as follows:

{_IOFBF} shall cause input/output to be fully buffered.

{_IOLBF} shall cause input/output to be line buffered.

{_IONBF} shall cause input/output to be unbuffered.

If *buf* is not a null pointer, the array it points to may be used instead of a buffer allocated by *setvbuf*( ) and the argument *size* specifies the size of the array; otherwise, *size* may determine the size of a buffer allocated by the *setvbuf*( ) function. The contents of the array at any time are unspecified.

For information about streams, see Section 2.5 (on page 495).

RETURN VALUE

Upon successful completion, *setvbuf*( ) shall return 0. Otherwise, it shall return a non-zero value CX if an invalid value is given for *type* or if the request cannot be honored, and may set *errno* to indicate the error.

ERRORS

The *setvbuf*( ) function may fail if:

CX [EBADF] The file descriptor underlying *stream* is not valid.

EXAMPLES

None.

APPLICATION USAGE

A common source of error is allocating buffer space as an ``automatic'' variable in a code block, and then failing to close the stream in the same block.

With *setvbuf*( ), allocating a buffer of *size* bytes does not necessarily imply that all of *size* bytes are used for the buffer area.

Applications should note that many implementations only provide line buffering on input from terminal devices.

RATIONALE

None.

62218 **FUTURE DIRECTIONS**

62219 None.

62225 **Issue 6**

62226 Extensions beyond the ISO C standard are marked.

62227 The *setvbuf( )* prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

NAME

shm_open — open a shared memory object (**REALTIME**)

SYNOPSIS

SHM

```
#include <sys/mman.h>

int shm_open(const char *name, int oflag, mode_t mode);
```

DESCRIPTION

The *shm_open*( ) function shall establish a connection between a shared memory object and a file descriptor. It shall create an open file description that refers to the shared memory object and a file descriptor that refers to that open file description. The file descriptor shall be allocated as described in Section 2.14 (on page 549), and can be used by other functions to refer to that shared memory object. The *name* argument points to a string naming a shared memory object. It is unspecified whether the name appears in the file system and is visible to other functions that take pathnames as arguments. The *name* argument conforms to the construction rules for a pathname, except that the interpretation of <slash> characters other than the leading <slash> character in *name* is implementation-defined, and that the length limits for the *name* argument are implementation-defined and need not be the same as the pathname limits {PATH_MAX} and {NAME_MAX}. If *name* begins with the <slash> character, then processes calling *shm_open*( ) with the same value of *name* refer to the same shared memory object, as long as that name has not been removed. If *name* does not begin with the <slash> character, the effect is implementation-defined.

If successful, *shm_open*( ) shall return a file descriptor for the shared memory object. The open file description is new, and therefore the file descriptor does not share it with any other processes. It is unspecified whether the file offset is set. The FD_CLOEXEC file descriptor flag associated with the new file descriptor is set.

The file status flags and file access modes of the open file description are according to the value of *oflag*. The *oflag* argument is the bitwise-inclusive OR of the following flags defined in the **<fcntl.h>** header. Applications specify exactly one of the first two values (access modes) below in the value of *oflag*:

O_RDONLY Open for read access only.

O_RDWR Open for read or write access.

Any combination of the remaining flags may be specified in the value of *oflag*:

O_CREAT If the shared memory object exists, this flag has no effect, except as noted under O_EXCL below. Otherwise, the shared memory object is created. The user ID of the shared memory object shall be set to the effective user ID of the process. The group ID of the shared memory object shall be set to the effective group ID of the process; however, if the *name* argument is visible in the file system, the group ID may be set to the group ID of the containing directory. The permission bits of the shared memory object shall be set to the value of the *mode* argument except those set in the file mode creation mask of the process. When bits in *mode* other than the file permission bits are set, the effect is unspecified. The *mode* argument does not affect whether the shared memory object is opened for reading, for writing, or for both. The shared memory object has a size of zero.

O_EXCL If O_EXCL and O_CREAT are set, *shm_open*( ) fails if the shared memory object exists. The check for the existence of the shared memory object and the creation of the object if it does not exist is atomic with respect to other

processes executing *shm_open*( ) naming the same shared memory object with O_EXCL and O_CREAT set. If O_EXCL is set and O_CREAT is not set, the result is undefined.

O_TRUNC If the shared memory object exists, and it is successfully opened O_RDWR, the object shall be truncated to zero length and the mode and owner shall be unchanged by this function call. The result of using O_TRUNC with O_RDONLY is undefined.

When a shared memory object is created, the state of the shared memory object, including all data associated with the shared memory object, persists until the shared memory object is unlinked and all other references are gone. It is unspecified whether the name and shared memory object state remain valid after a system reboot.

RETURN VALUE

Upon successful completion, the *shm_open*( ) function shall return a non-negative integer representing the file descriptor. Otherwise, it shall return −1 and set *errno* to indicate the error.

ERRORS

The *shm_open*( ) function shall fail if:

[EACCES] The shared memory object exists and the permissions specified by *oflag* are denied, or the shared memory object does not exist and permission to create the shared memory object is denied, or O_TRUNC is specified and write permission is denied.

[EEXIST] O_CREAT and O_EXCL are set and the named shared memory object already exists.

[EINTR] The *shm_open*( ) operation was interrupted by a signal.

[EINVAL] The *shm_open*( ) operation is not supported for the given name.

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] Too many shared memory objects are currently open in the system.

[ENOENT] O_CREAT is not set and the named shared memory object does not exist.

[ENOSPC] There is insufficient space for the creation of the new shared memory object.

The *shm_open*( ) function may fail if:

[ENAMETOOLONG]

The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI systems, or has a pathname component that is longer than {_POSIX_NAME_MAX} on systems that do not support the XSI option or longer than {_XOPEN_NAME_MAX} on XSI systems.

EXAMPLES

Creating and Mapping a Shared Memory Object

The following code segment demonstrates the use of *shm_open*( ) to create a shared memory object which is then sized using *ftruncate*( ) before being mapped into the process address space using *mmap*( ):

```
#include <unistd.h>
#include <sys/mman.h>
...

#define MAX_LEN 10000
struct region {        /* Defines "structure" of shared memory */
    int len;
    char buf[MAX_LEN];
};
struct region *rptr;
int fd;

/* Create shared memory object and set its size */

fd = shm_open("/myregion", O_CREAT | O_RDWR, S_IRUSR | S_IWUSR);
if (fd == -1)
    /* Handle error */;

if (ftruncate(fd, sizeof(struct region)) == -1)
    /* Handle error */;

/* Map shared memory object */

rptr = mmap(NULL, sizeof(struct region),
       PROT_READ | PROT_WRITE, MAP_SHARED, fd, 0);
if (rptr == MAP_FAILED)
    /* Handle error */;

/* Now we can refer to mapped region using fields of rptr;
   for example, rptr->len */
...
```

APPLICATION USAGE

None.

RATIONALE

When the Memory Mapped Files option is supported, the normal *open*( ) call is used to obtain a descriptor to a file to be mapped according to existing practice with *mmap*( ). When the Shared Memory Objects option is supported, the *shm_open*( ) function shall obtain a descriptor to the shared memory object to be mapped.

There is ample precedent for having a file descriptor represent several types of objects. In the POSIX.1-1990 standard, a file descriptor can represent a file, a pipe, a FIFO, a tty, or a directory. Many implementations simply have an operations vector, which is indexed by the file descriptor type and does very different operations. Note that in some cases the file descriptor passed to generic operations on file descriptors is returned by *open*( ) or *creat*( ) and in some cases returned by alternate functions, such as *pipe*( ). The latter technique is used by *shm_open*( ).

Note that such shared memory objects can actually be implemented as mapped files. In both cases, the size can be set after the open using *ftruncate*( ). The *shm_open*( ) function itself does not

create a shared object of a specified size because this would duplicate an extant function that set the size of an object referenced by a file descriptor.

On implementations where memory objects are implemented using the existing file system, the *shm_open*( ) function may be implemented using a macro that invokes *open*( ), and the *shm_unlink*( ) function may be implemented using a macro that invokes *unlink*( ).

For implementations without a permanent file system, the definition of the name of the memory objects is allowed not to survive a system reboot. Note that this allows systems with a permanent file system to implement memory objects as data structures internal to the implementation as well.

On implementations that choose to implement memory objects using memory directly, a *shm_open*( ) followed by an *ftruncate*( ) and *close*( ) can be used to preallocate a shared memory area and to set the size of that preallocation. This may be necessary for systems without virtual memory hardware support in order to ensure that the memory is contiguous.

The set of valid open flags to *shm_open*( ) was restricted to O_RDONLY, O_RDWR, O_CREAT, and O_TRUNC because these could be easily implemented on most memory mapping systems. This volume of POSIX.1-2017 is silent on the results if the implementation cannot supply the requested file access because of implementation-defined reasons, including hardware ones.

The error conditions [EACCES] and [ENOTSUP] are provided to inform the application that the implementation cannot complete a request.

[EACCES] indicates for implementation-defined reasons, probably hardware-related, that the implementation cannot comply with a requested mode because it conflicts with another requested mode. An example might be that an application desires to open a memory object two times, mapping different areas with different access modes. If the implementation cannot map a single area into a process space in two places, which would be required if different access modes were required for the two areas, then the implementation may inform the application at the time of the second open.

[ENOTSUP] indicates for implementation-defined reasons, probably hardware-related, that the implementation cannot comply with a requested mode at all. An example would be that the hardware of the implementation cannot support write-only shared memory areas.

On all implementations, it may be desirable to restrict the location of the memory objects to specific file systems for performance (such as a RAM disk) or implementation-defined reasons (shared memory supported directly only on certain file systems). The *shm_open*( ) function may be used to enforce these restrictions. There are a number of methods available to the application to determine an appropriate name of the file or the location of an appropriate directory. One way is from the environment via *getenv*( ). Another would be from a configuration file.

This volume of POSIX.1-2017 specifies that memory objects have initial contents of zero when created. This is consistent with current behavior for both files and newly allocated memory. For those implementations that use physical memory, it would be possible that such implementations could simply use available memory and give it to the process uninitialized. This, however, is not consistent with standard behavior for the uninitialized data area, the stack, and of course, files. Finally, it is highly desirable to set the allocated memory to zero for security reasons. Thus, initializing memory objects to zero is required.

FUTURE DIRECTIONS

A future version might require the *shm_open*( ) and *shm_unlink*( ) functions to have semantics similar to normal file system operations.

62404 **Issue 6**

62405 The *shm_open( )* function is marked as part of the Shared Memory Objects option.

62406 The [ENOSYS] error condition has been removed as stubs need not be provided if an
62407 implementation does not support the Shared Memory Objects option.

62408 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/126 is applied, adding the example to the
62409 EXAMPLES section.

62410 **Issue 7**

62411 Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and
62412 changing [ENAMETOOLONG] from a ``shall fail'' to a ``may fail'' error.

62413 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

62414 SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the
62415 user ID and group ID of the shared memory object.

62416 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0324 [835], XSH/TC2-2008/0325 [835],
62417 and XSH/TC2-2008/0326 [835] are applied.

NAME

shm_unlink — remove a shared memory object (**REALTIME**)

SYNOPSIS

SHM
```
#include <sys/mman.h>

int shm_unlink(const char *name);
```

DESCRIPTION

The *shm_unlink*( ) function shall remove the name of the shared memory object named by the string pointed to by *name*.

If one or more references to the shared memory object exist when the object is unlinked, the name shall be removed before *shm_unlink*( ) returns, but the removal of the memory object contents shall be postponed until all open and map references to the shared memory object have been removed.

Even if the object continues to exist after the last *shm_unlink*( ), reuse of the name shall subsequently cause *shm_open*( ) to behave as if no shared memory object of this name exists (that is, *shm_open*( ) will fail if O_CREAT is not set, or will create a new shared memory object if O_CREAT is set).

RETURN VALUE

Upon successful completion, a value of zero shall be returned. Otherwise, a value of −1 shall be returned and *errno* set to indicate the error. If −1 is returned, the named shared memory object shall not be changed by this function call.

ERRORS

The *shm_unlink*( ) function shall fail if:

[EACCES] Permission is denied to unlink the named shared memory object.

[ENOENT] The named shared memory object does not exist.

The *shm_unlink*( ) function may fail if:

[ENAMETOOLONG]
The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems
XSI that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI systems, or has a pathname component that is longer than
XSI {_POSIX_NAME_MAX} on systems that do not support the XSI option or longer than {_XOPEN_NAME_MAX} on XSI systems. A call to *shm_unlink*( ) with a *name* argument that contains the same shared memory object name as was previously used in a successful *shm_open*( ) call shall not give an [ENAMETOOLONG] error.

EXAMPLES

None.

APPLICATION USAGE

Names of memory objects that were allocated with *open*( ) are deleted with *unlink*( ) in the usual fashion. Names of memory objects that were allocated with *shm_open*( ) are deleted with *shm_unlink*( ). Note that the actual memory object is not destroyed until the last close and unmap on it have occurred if it was already in use.

62459 **RATIONALE**

62460 None.

62461 **FUTURE DIRECTIONS**

62462 A future version might require the *shm_open*( ) and *shm_unlink*( ) functions to have semantics
62463 similar to normal file system operations.

62464 **SEE ALSO**

62465 *close*( ), *mmap*( ), *munmap*( ), *shmat*( ), *shmctl*( ), *shmdt*( ), *shm_open*( )

62466 XBD **<sys/mman.h>**

62467 **CHANGE HISTORY**

62468 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

62469 **Issue 6**

62470 The *shm_unlink*( ) function is marked as part of the Shared Memory Objects option.

62471 In the DESCRIPTION, text is added to clarify that reusing the same name after a *shm_unlink*( )
62472 will not attach to the old shared memory object.

62473 The [ENOSYS] error condition has been removed as stubs need not be provided if an
62474 implementation does not support the Shared Memory Objects option.

62475 **Issue 7**

62476 Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a
62477 ``shall fail'' to a ``may fail'' error.

62478 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

NAME

shmat — XSI shared memory attach operation

SYNOPSIS

XSI
```
#include <sys/shm.h>

void *shmat(int shmid, const void *shmaddr, int shmflg);
```

DESCRIPTION

The *shmat*( ) function operates on XSI shared memory (see XBD Section 3.346, on page 89). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 503).

The *shmat*( ) function attaches the shared memory segment associated with the shared memory identifier specified by *shmid* to the address space of the calling process. The segment is attached at the address specified by one of the following criteria:

If *shmaddr* is a null pointer, the segment is attached at the first available address as selected by the system.

If *shmaddr* is not a null pointer and (*shmflg* &SHM_RND) is non-zero, the segment is attached at the address given by (*shmaddr* –((*uintptr_t*)*shmaddr* %SHMLBA)). The character '%' is the C-language remainder operator.

If *shmaddr* is not a null pointer and (*shmflg* &SHM_RND) is 0, the segment is attached at the address given by *shmaddr*.

The segment is attached for reading if (*shmflg* &SHM_RDONLY) is non-zero and the calling process has read permission; otherwise, if it is 0 and the calling process has read and write permission, the segment is attached for reading and writing.

RETURN VALUE

Upon successful completion, *shmat*( ) shall increment the value of *shm_nattch* in the data structure associated with the shared memory ID of the attached shared memory segment and return the segment's start address. Also, the *shm_atime* timestamp shall be set to the current time, as described in Section 2.7.1 (on page 502).

Otherwise, the shared memory segment shall not be attached, *shmat*( ) shall return (**void** *)–1, and *errno* shall be set to indicate the error.

ERRORS

The *shmat*( ) function shall fail if:

[EACCES] Operation permission is denied to the calling process; see Section 2.7 (on page 501).

[EINVAL] The value of *shmid* is not a valid shared memory identifier, the *shmaddr* is not a null pointer, and the value of (*shmaddr* –((*uintptr_t*)*shmaddr* %SHMLBA)) is an illegal address for attaching shared memory; or the *shmaddr* is not a null pointer, (*shmflg* &SHM_RND) is 0, and the value of *shmaddr* is an illegal address for attaching shared memory.

[EMFILE] The number of shared memory segments attached to the calling process would exceed the system-imposed limit.

[ENOMEM] The available data space is not large enough to accommodate the shared memory segment.

EXAMPLES

None.

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 501) can be easily modified to use the alternative interfaces.

62547 **NAME**

62548 shmctl — XSI shared memory control operations

62549 **SYNOPSIS**

62550 XSI
```
#include <sys/shm.h>

int shmctl(int shmid, int cmd, struct shmid_ds *buf);
```

62552 **DESCRIPTION**

62553 The *shmctl*( ) function operates on XSI shared memory (see XBD Section 3.346, on page 89). It is
62554 unspecified whether this function interoperates with the realtime interprocess communication
62555 facilities defined in Section 2.8 (on page 503).

62556 The *shmctl*( ) function provides a variety of shared memory control operations as specified by
62557 *cmd*. The following values for *cmd* are available:

62558 IPC_STAT Place the current value of each member of the **shmid_ds** data structure
62559 associated with *shmid* into the structure pointed to by *buf*. The contents of the
62560 structure are defined in **<sys/shm.h>**.

62561 IPC_SET Set the value of the following members of the **shmid_ds** data structure
62562 associated with *shmid* to the corresponding value found in the structure
62563 pointed to by *buf*:

62564 `shm_perm.uid`
62565 `shm_perm.gid`
62566 `shm_perm.mode` Low-order nine bits.

62567 Also, the *shm_ctime* timestamp shall be set to the current time, as described in
62568 Section 2.7.1 (on page 502).

62569 IPC_SET can only be executed by a process that has an effective user ID equal
62570 to either that of a process with appropriate privileges or to the value of
62571 *shm_perm.cuid* or *shm_perm.uid* in the **shmid_ds** data structure associated with
62572 *shmid*.

62573 IPC_RMID Remove the shared memory identifier specified by *shmid* from the system and
62574 destroy the shared memory segment and **shmid_ds** data structure associated
62575 with it. IPC_RMID can only be executed by a process that has an effective user
62576 ID equal to either that of a process with appropriate privileges or to the value
62577 of *shm_perm.cuid* or *shm_perm.uid* in the **shmid_ds** data structure associated
62578 with *shmid*.

62579 **RETURN VALUE**

62580 Upon successful completion, *shmctl*( ) shall return 0; otherwise, it shall return −1 and set *errno* to
62581 indicate the error.

62582 **ERRORS**

62583 The *shmctl*( ) function shall fail if:

62584 [EACCES] The argument *cmd* is equal to IPC_STAT and the calling process does not have
62585 read permission; see Section 2.7 (on page 501).

62586 [EINVAL] The value of *shmid* is not a valid shared memory identifier, or the value of *cmd*
62587 is not a valid command.

62588 [EPERM] The argument *cmd* is equal to IPC_RMID or IPC_SET and the effective user ID
62589 of the calling process is not equal to that of a process with appropriate
62590 privileges and it is not equal to the value of *shm_perm.cuid* or *shm_perm.uid* in

the data structure associated with *shmid*.

The *shmctl*( ) function may fail if:

[EOVERFLOW] The *cmd* argument is IPC_STAT and the *gid* or *uid* value is too large to be stored in the structure pointed to by the *buf* argument.

EXAMPLES

None.

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 501) can be easily modified to use the alternative interfaces.

62618 **NAME**

62619 shmdt — XSI shared memory detach operation

62620 **SYNOPSIS**

62621 XSI
```
#include <sys/shm.h>
```

62622
```
int shmdt(const void *shmaddr);
```

62623 **DESCRIPTION**

62624 The *shmdt*( ) function operates on XSI shared memory (see XBD Section 3.346, on page 89). It is
62625 unspecified whether this function interoperates with the realtime interprocess communication
62626 facilities defined in Section 2.8 (on page 503).

62627 The *shmdt*( ) function detaches the shared memory segment located at the address specified by
62628 *shmaddr* from the address space of the calling process.

62629 **RETURN VALUE**

62630 Upon successful completion, *shmdt*( ) shall decrement the value of *shm_nattch* in the data
62631 structure associated with the shared memory ID of the attached shared memory segment and
62632 return 0. Also, the *shm_dtime* timestamp shall be set to the current time, as described in Section
62633 2.7.1 (on page 502).

62634 Otherwise, the shared memory segment shall not be detached, *shmdt*( ) shall return –1, and *errno*
62635 shall be set to indicate the error.

62636 **ERRORS**

62637 The *shmdt*( ) function shall fail if:

62638 [EINVAL] The value of *shmaddr* is not the data segment start address of a shared memory
62639 segment.

62640 **EXAMPLES**

62641 None.

62642 **APPLICATION USAGE**

62643 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
62644 Application developers who need to use IPC should design their applications so that modules
62645 using the IPC routines described in Section 2.7 (on page 501) can be easily modified to use the
62646 alternative interfaces.

NAME

shmget — get an XSI shared memory segment

SYNOPSIS

XSI
```
#include <sys/shm.h>

int shmget(key_t key, size_t size, int shmflg);
```

DESCRIPTION

The *shmget*( ) function operates on XSI shared memory (see XBD Section 3.346, on page 89). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 503).

The *shmget*( ) function shall return the shared memory identifier associated with *key*.

A shared memory identifier, associated data structure, and shared memory segment of at least *size* bytes (see **<sys/shm.h>**) are created for *key* if one of the following is true:

The argument *key* is equal to IPC_PRIVATE.

The argument *key* does not already have a shared memory identifier associated with it and (*shmflg* &IPC_CREAT) is non-zero.

Upon creation, the data structure associated with the new shared memory identifier shall be initialized as follows:

The values of *shm_perm.cuid*, *shm_perm.uid*, *shm_perm.cgid*, and *shm_perm.gid* are set to the effective user ID and effective group ID, respectively, of the calling process.

The low-order nine bits of *shm_perm.mode* are set to the low-order nine bits of *shmflg*.

The value of *shm_segsz* is set to the value of *size*.

The values of *shm_lpid*, *shm_nattch*, *shm_atime*, and *shm_dtime* are set to 0.

The value of *shm_ctime* is set to the current time, as described in Section 2.7.1 (on page 502).

When the shared memory segment is created, it shall be initialized with all zero values.

RETURN VALUE

Upon successful completion, *shmget*( ) shall return a non-negative integer, namely a shared memory identifier; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *shmget*( ) function shall fail if:

[EACCES] A shared memory identifier exists for *key* but operation permission as specified by the low-order nine bits of *shmflg* would not be granted; see Section 2.7 (on page 501).

[EEXIST] A shared memory identifier exists for the argument *key* but (*shmflg* &IPC_CREAT) &&(*shmflg* &IPC_EXCL) is non-zero.

[EINVAL] A shared memory segment is to be created and the value of size is less than the system-imposed minimum or greater than the system-imposed maximum.

[EINVAL] No shared memory segment is to be created and a shared memory segment exists for *key* but the size of the segment associated with it is less than *size*.

[ENOENT] A shared memory identifier does not exist for the argument *key* and (*shmflg* &IPC_CREAT) is 0.

62703 [ENOMEM] A shared memory identifier and associated shared memory segment are to be
62704 created, but the amount of available physical memory is not sufficient to fill
62705 the request.

62706 [ENOSPC] A shared memory identifier is to be created, but the system-imposed limit on
62707 the maximum number of allowed shared memory identifiers system-wide
62708 would be exceeded.

62709 **EXAMPLES**

62710 None.

62711 **APPLICATION USAGE**

62712 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
62713 Application developers who need to use IPC should design their applications so that modules
62714 using the IPC routines described in Section 2.7 (on page 501) can be easily modified to use the
62715 alternative interfaces.

62734 **NAME**

62735 shutdown — shut down socket send and receive operations

62736 **SYNOPSIS**

62737 `#include <sys/socket.h>`

62738 `int shutdown(int socket, int how);`

62739 **DESCRIPTION**

62740 The *shutdown*( ) function shall cause all or part of a full-duplex connection on the socket
62741 associated with the file descriptor *socket* to be shut down.

62742 The *shutdown*( ) function takes the following arguments:

62743 *socket* Specifies the file descriptor of the socket.

62744 *how* Specifies the type of shutdown. The values are as follows:

62745 SHUT_RD Disables further receive operations.

62746 SHUT_WR Disables further send operations.

62747 SHUT_RDWR Disables further send and receive operations.

62748 The *shutdown*( ) function disables subsequent send and/or receive operations on a socket,
62749 depending on the value of the *how* argument.

62750 **RETURN VALUE**

62751 Upon successful completion, *shutdown*( ) shall return 0; otherwise, –1 shall be returned and *errno*
62752 set to indicate the error.

62753 **ERRORS**

62754 The *shutdown*( ) function shall fail if:

62755 [EBADF] The *socket* argument is not a valid file descriptor.

62756 [EINVAL] The *how* argument is invalid.

62757 [ENOTCONN] The socket is not connected.

62758 [ENOTSOCK] The *socket* argument does not refer to a socket.

62759 The *shutdown*( ) function may fail if:

62760 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

62761 **EXAMPLES**

62762 None.

62763 **APPLICATION USAGE**

62764 None.

62772 XBD **<sys/socket.h>**

62773 **CHANGE HISTORY**
62774 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

62775 **NAME**

62776 sigaction ‡'examine and change a signal action

62777 **SYNOPSIS**

62778 CX
```
#include <signal.h>

int sigaction(int sig, const struct sigaction *restrict act,
    struct sigaction *restrict oact);
```

62781 **DESCRIPTION**

62782 The *sigaction*( ) function allows the calling process to examine and/or specify the action to be
62783 associated with a specific signal. The argument *sig* specifies the signal; acceptable values are
62784 defined in **<signal.h>**.

62785 The structure **sigaction**, used to describe an action to be taken, is defined in the **<signal.h>**
62786 header to include at least the following members:

62787

Member Type	Member Name	Description
void(*) (int)	*sa_handler*	Pointer to a signal-catching function or one of the macros SIG_IGN or SIG_DFL.
sigset_t	*sa_mask*	Additional set of signals to be blocked during execution of signal-catching function.
int	*sa_flags*	Special flags to affect behavior of signal.
void(*) (int, siginfo_t *, void *)	*sa_sigaction*	Pointer to a signal-catching function.

62796 The storage occupied by *sa_handler* and *sa_sigaction* may overlap, and a conforming application
62797 shall not use both simultaneously.

62798 If the argument *act* is not a null pointer, it points to a structure specifying the action to be
62799 associated with the specified signal. If the argument *oact* is not a null pointer, the action
62800 previously associated with the signal is stored in the location pointed to by the argument *oact*. If
62801 the argument *act* is a null pointer, signal handling is unchanged; thus, the call can be used to
62802 enquire about the current handling of a given signal. The SIGKILL and SIGSTOP signals shall
62803 not be added to the signal mask using this mechanism; this restriction shall be enforced by the
62804 system without causing an error to be indicated.

62805 If the SA_SIGINFO flag (see below) is cleared in the *sa_flags* field of the **sigaction** structure, the
62806 *sa_handler* field identifies the action to be associated with the specified signal. If the
62807 SA_SIGINFO flag is set in the *sa_flags* field, the *sa_sigaction* field specifies a signal-catching
62808 function.

62809 The *sa_flags* field can be used to modify the behavior of the specified signal.

62810 The following flags, defined in the **<signal.h>** header, can be set in *sa_flags*:

62811 XSI SA_NOCLDSTOP Do not generate SIGCHLD when children stop or stopped children
62812 continue.

62813 If *sig* is SIGCHLD and the SA_NOCLDSTOP flag is not set in *sa_flags*, and
62814 the implementation supports the SIGCHLD signal, then a SIGCHLD
62815 signal shall be generated for the calling process whenever any of its child
62816 XSI processes stop and a SIGCHLD signal may be generated for the calling
62817 process whenever any of its stopped child processes are continued. If *sig*
62818 is SIGCHLD and the SA_NOCLDSTOP flag is set in *sa_flags*, then the
62819 implementation shall not generate a SIGCHLD signal in this way.

62820 XSI SA_ONSTACK If set and an alternate signal stack has been declared with *sigaltstack*( ), the
62821 signal shall be delivered to the calling process on that stack. Otherwise,
62822 the signal shall be delivered on the current stack.

62823 SA_RESETHAND If set, the disposition of the signal shall be reset to SIG_DFL and the
62824 SA_SIGINFO flag shall be cleared on entry to the signal handler.

62825 **Note:** SIGILL and SIGTRAP cannot be automatically reset when delivered;
62826 the system silently enforces this restriction.

62827 Otherwise, the disposition of the signal shall not be modified on entry to
62828 the signal handler.

62829 In addition, if this flag is set, *sigaction*() may behave as if the
62830 SA_NODEFER flag were also set.

62831 SA_RESTART This flag affects the behavior of interruptible functions; that is, those
62832 specified to fail with *errno* set to [EINTR]. If set, and a function specified
62833 as interruptible is interrupted by this signal, the function shall restart and
62834 shall not fail with [EINTR] unless otherwise specified. If an interruptible
62835 function which uses a timeout is restarted, the duration of the timeout
62836 following the restart is set to an unspecified value that does not exceed
62837 the original timeout value. If the flag is not set, interruptible functions
62838 interrupted by this signal shall fail with *errno* set to [EINTR].

62839 SA_SIGINFO If cleared and the signal is caught, the signal-catching function shall be
62840 entered as:

62841 `void func(int signo);`

62842 where *signo* is the only argument to the signal-catching function. In this
62843 case, the application shall use the *sa_handler* member to describe the
62844 signal-catching function and the application shall not modify the
62845 *sa_sigaction* member.

62846 If SA_SIGINFO is set and the signal is caught, the signal-catching
62847 function shall be entered as:

62848 `void func(int signo, siginfo_t *info, void *context);`

62849 where two additional arguments are passed to the signal-catching
62850 function. The second argument shall point to an object of type **siginfo_t**
62851 explaining the reason why the signal was generated; the third argument
62852 can be cast to a pointer to an object of type **ucontext_t** to refer to the
62853 receiving thread's context that was interrupted when the signal was
62854 delivered. In this case, the application shall use the *sa_sigaction* member to
62855 describe the signal-catching function and the application shall not modify
62856 the *sa_handler* member.

62857 The *si_signo* member contains the system-generated signal number.

62858 XSI The *si_errno* member may contain implementation-defined additional
62859 error information; if non-zero, it contains an error number identifying the
62860 condition that caused the signal to be generated.

62861 The *si_code* member contains a code identifying the cause of the signal, as
62862 described in Section 2.4.3 (on page 490).

62863 XSI SA_NOCLDWAIT If *sig* does not equal SIGCHLD, the behavior is unspecified. Otherwise,
62864 the behavior of the SA_NOCLDWAIT flag is as specified in Consequences
62865 of Process Termination (on page 553).

62866 SA_NODEFER If set and *sig* is caught, *sig* shall not be added to the thread's signal mask
62867 on entry to the signal handler unless it is included in *sa_mask*. Otherwise,
62868 *sig* shall always be added to the thread's signal mask on entry to the
62869 signal handler.

62870 When a signal is caught by a signal-catching function installed by *sigaction*( ), a new signal mask
62871 is calculated and installed for the duration of the signal-catching function (or until a call to either
62872 *sigprocmask*( ) or *sigsuspend*( ) is made). This mask is formed by taking the union of the current
62873 signal mask and the value of the *sa_mask* for the signal being delivered, and unless
62874 SA_NODEFER or SA_RESETHAND is set, then including the signal being delivered. If and
62875 when the user's signal handler returns normally, the original signal mask is restored.

62876 Once an action is installed for a specific signal, it shall remain installed until another action is
62877 explicitly requested (by another call to *sigaction*( )), until the SA_RESETHAND flag causes
62878 resetting of the handler, or until one of the *exec* functions is called.

62879 If the previous action for *sig* had been established by *signal*( ), the values of the fields returned in
62880 the structure pointed to by *oact* are unspecified, and in particular *oact->sa_handler* is not
62881 necessarily the same value passed to *signal*( ). However, if a pointer to the same structure or a
62882 copy thereof is passed to a subsequent call to *sigaction*( ) via the *act* argument, handling of the
62883 signal shall be as if the original call to *signal*( ) were repeated.

62884 If *sigaction*( ) fails, no new signal handler is installed.

62885 It is unspecified whether an attempt to set the action for a signal that cannot be caught or
62886 ignored to SIG_DFL is ignored or causes an error to be returned with *errno* set to [EINVAL].

62887 If SA_SIGINFO is not set in *sa_flags*, then the disposition of subsequent occurrences of *sig* when
62888 it is already pending is implementation-defined; the signal-catching function shall be invoked
62889 with a single argument. If SA_SIGINFO is set in *sa_flags*, then subsequent occurrences of *sig*
62890 generated by *sigqueue*( ) or as a result of any signal-generating function that supports the
62891 specification of an application-defined value (when *sig* is already pending) shall be queued in
62892 FIFO order until delivered or accepted; the signal-catching function shall be invoked with three
62893 arguments. The application specified value is passed to the signal-catching function as the
62894 *si_value* member of the **siginfo_t** structure.

62895 The result of the use of *sigaction*( ) and a *sigwait*( ) function concurrently within a process on the
62896 same signal is unspecified.

62897 **RETURN VALUE**

62898 Upon successful completion, *sigaction*( ) shall return 0; otherwise, –1 shall be returned, *errno* shall
62899 be set to indicate the error, and no new signal-catching function shall be installed.

ERRORS

The *sigaction*( ) function shall fail if:

[EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a signal that cannot be caught or ignore a signal that cannot be ignored.

The *sigaction*( ) function may fail if:

[EINVAL] An attempt was made to set the action to SIG_DFL for a signal that cannot be caught or ignored (or both).

In addition, on systems that do not support the XSI option, the *sigaction*( ) function may fail if the SA_SIGINFO flag is set in the *sa_flags* field of the **sigaction** structure for a signal not in the range SIGRTMIN to SIGRTMAX.

EXAMPLES

Establishing a Signal Handler

The following example demonstrates the use of *sigaction*( ) to establish a handler for the SIGINT signal.

```
#include <signal.h>

static void handler(int signum)
{
    /* Take appropriate actions for signal delivery */
}

int main()
{
    struct sigaction sa;

    sa.sa_handler = handler;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = SA_RESTART; /* Restart functions if
                                 interrupted by handler */
    if (sigaction(SIGINT, &sa, NULL) == -1)
        /* Handle error */;

    /* Further code */
}
```

APPLICATION USAGE

The *sigaction*( ) function supersedes the *signal*( ) function, and should be used in preference. In particular, *sigaction*( ) and *signal*( ) should not be used in the same process to control the same signal. The behavior of async-signal-safe functions, as defined in their respective DESCRIPTION sections, is as specified by this volume of POSIX.1-2017, regardless of invocation from a signal-catching function. This is the only intended meaning of the statement that async-signal-safe functions may be used in signal-catching functions without restrictions. Applications must still consider all effects of such functions on such things as data structures, files, and process state. In particular, application developers need to consider the restrictions on interactions when interrupting *sleep*( ) and interactions among multiple handles for a file description. The fact that any specific function is listed as async-signal-safe does not necessarily mean that invocation of that function from a signal-catching function is recommended.

In order to prevent errors arising from interrupting non-async-signal-safe function calls, applications should protect calls to these functions either by blocking the appropriate signals or

through the use of some programmatic semaphore (see *semget( )*, *sem_init( )*, *sem_open( )*, and so on). Note in particular that even the ``safe'' functions may modify *errno*; the signal-catching function, if not executing as an independent thread, should save and restore its value in order to avoid the possibility that delivery of a signal in between an error return from a function that sets *errno* and the subsequent examination of *errno* could result in the signal-catching function changing the value of *errno*. Naturally, the same principles apply to the async-signal-safety of application routines and asynchronous data access. Note that *longjmp( )* and *siglongjmp( )* are not in the list of async-signal-safe functions. This is because the code executing after *longjmp( )* and *siglongjmp( )* can call any unsafe functions with the same danger as calling those unsafe functions directly from the signal handler. Applications that use *longjmp( )* and *siglongjmp( )* from within signal handlers require rigorous protection in order to be portable. Many of the other functions that are excluded from the list are traditionally implemented using either *malloc( )* or *free( )* functions or the standard I/O library, both of which traditionally use data structures in a non-async-signal-safe manner. Since any combination of different functions using a common data structure can cause async-signal-safety problems, this volume of POSIX.1-2017 does not define the behavior when any unsafe function is called in a signal handler that interrupts an unsafe function.

Usually, the signal is executed on the stack that was in effect before the signal was delivered. An alternate stack may be specified to receive a subset of the signals being caught.

When the signal handler returns, the receiving thread resumes execution at the point it was interrupted unless the signal handler makes other arrangements. If *longjmp( )* or *_longjmp( )* is used to leave the signal handler, then the signal mask must be explicitly restored.

This volume of POSIX.1-2017 defines the third argument of a signal handling function when SA_SIGINFO is set as a **void *** instead of a **ucontext_t ***, but without requiring type checking. New applications should explicitly cast the third argument of the signal handling function to **ucontext_t ***.

The BSD optional four argument signal handling function is not supported by this volume of POSIX.1-2017. The BSD declaration would be:

```
void handler(int sig, int code, struct sigcontext *scp,
    char *addr);
```

where *sig* is the signal number, *code* is additional information on certain signals, *scp* is a pointer to the **sigcontext** structure, and *addr* is additional address information. Much the same information is available in the objects pointed to by the second argument of the signal handler specified when SA_SIGINFO is set.

Since the *sigaction( )* function is allowed but not required to set SA_NODEFER when the application sets the SA_RESETHAND flag, applications which depend on the SA_RESETHAND functionality for the newly installed signal handler must always explicitly set SA_NODEFER when they set SA_RESETHAND in order to be portable.

See also the rationale for Realtime Signal Generation and Delivery in XRAT Section B.2.4.2 (on page 3578).

RATIONALE

Although this volume of POSIX.1-2017 requires that signals that cannot be ignored shall not be added to the signal mask when a signal-catching function is entered, there is no explicit requirement that subsequent calls to *sigaction( )* reflect this in the information returned in the *oact* argument. In other words, if SIGKILL is included in the *sa_mask* field of *act*, it is unspecified whether or not a subsequent call to *sigaction( )* returns with SIGKILL included in the *sa_mask* field of *oact*.

The SA_NOCLDSTOP flag, when supplied in the *act->sa_flags* parameter, allows overloading SIGCHLD with the System V semantics that each SIGCLD signal indicates a single terminated child. Most conforming applications that catch SIGCHLD are expected to install signal-catching functions that repeatedly call the *waitpid*( ) function with the WNOHANG flag set, acting on each child for which status is returned, until *waitpid*( ) returns zero. If stopped children are not of interest, the use of the SA_NOCLDSTOP flag can prevent the overhead from invoking the signal-catching routine when they stop.

Some historical implementations also define other mechanisms for stopping processes, such as the *ptrace*( ) function. These implementations usually do not generate a SIGCHLD signal when processes stop due to this mechanism; however, that is beyond the scope of this volume of POSIX.1-2017.

This volume of POSIX.1-2017 requires that calls to *sigaction*( ) that supply a NULL *act* argument succeed, even in the case of signals that cannot be caught or ignored (that is, SIGKILL or SIGSTOP). The System V *signal*( ) and BSD *sigvec*( ) functions return [EINVAL] in these cases and, in this respect, their behavior varies from *sigaction*( ).

This volume of POSIX.1-2017 requires that *sigaction*( ) properly save and restore a signal action set up by the ISO C standard *signal*( ) function. However, there is no guarantee that the reverse is true, nor could there be given the greater amount of information conveyed by the **sigaction** structure. Because of this, applications should avoid using both functions for the same signal in the same process. Since this cannot always be avoided in case of general-purpose library routines, they should always be implemented with *sigaction*( ).

It was intended that the *signal*( ) function should be implementable as a library routine using *sigaction*( ).

The POSIX Realtime Extension extends the *sigaction*( ) function as specified by the POSIX.1-1990 standard to allow the application to request on a per-signal basis via an additional signal action flag that the extra parameters, including the application-defined signal value, if any, be passed to the signal-catching function.

FUTURE DIRECTIONS

None.

XBD **<signal.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and POSIX Threads Extension.

In the DESCRIPTION, the second argument to *func* when SA_SIGINFO is set is no longer permitted to be NULL, and the description of permitted **siginfo_t** contents is expanded by reference to **<signal.h>**.

Since the X/OPEN UNIX Extension functionality is now folded into the BASE, the [ENOTSUP] error is deleted.

Issue 6

The Open Group Corrigendum U028/7 is applied. In the paragraph entitled ``Signal Effects on Other Functions'', a reference to *sigpending*( ) is added.

In the DESCRIPTION, the text ``Signal Generation and Delivery'', ``Signal Actions'', and ``Signal Effects on Other Functions'' are moved to a separate section of this volume of POSIX.1-2017.

Text describing functionality from the Realtime Signals Extension option is marked.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

> The [ENOTSUP] error condition is added.

The normative text is updated to avoid use of the term ``must'' for application requirements.

The **restrict** keyword is added to the *sigaction*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

References to the *wait3*( ) function are removed.

The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an extension over the ISO C standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/57 is applied, changing text in the table describing the **sigaction** structure.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/127 is applied, removing text from the DESCRIPTION duplicated later in the same section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/128 is applied, updating the DESCRIPTION and APPLICATION USAGE sections. Changes are made to refer to the thread rather than the process.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/129 is applied, adding the example to the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #004 is applied.

Austin Group Interpretations 1003.1-2001 #065 and #084 are applied, clarifying the role of the SA_NODEFER flag with respect to the signal mask, and clarifying the SA_RESTART flag for interrupted functions which use timeouts.

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XSH-ERN-167 is applied, updating the APPLICATION USAGE section.

SD5-XSH-ERN-172 is applied, updating the DESCRIPTION to make optional the requirement that when the SA_RESETHAND flag is set, *sigaction*( ) shall behave as if the SA_NODEFER flag were also set.

Functionality relating to the Realtime Signals Extension option is moved to the Base.

The description of the *si_code* member is replaced with a reference to Section 2.4.3 (on page 490).

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0578 [66] and XSH/TC1-2008/0579 [140] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0329 [690] and XSH/TC2-2008/0330 [491] are applied.

NAME

sigaddset ‡'add a signal to a signal set

SYNOPSIS

CX
```
#include <signal.h>

int sigaddset(sigset_t *set, int signo);
```

DESCRIPTION

The *sigaddset*( ) function adds the individual signal specified by the *signo* to the signal set pointed to by *set*.

Applications shall call either *sigemptyset*( ) or *sigfillset*( ) at least once for each object of type **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is nonetheless supplied as an argument to any of *pthread_sigmask*( ), *sigaction*( ), *sigaddset*( ), *sigdelset*( ), *sigismember*( ), *sigpending*( ), *sigprocmask*( ), *sigsuspend*( ), *sigtimedwait*( ), *sigwait*( ), or *sigwaitinfo*( ), the results are undefined.

RETURN VALUE

Upon successful completion, *sigaddset*( ) shall return 0; otherwise, it shall return −1 and set *errno* to indicate the error.

ERRORS

The *sigaddset*( ) function may fail if:

[EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<signal.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in previous issues.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an extension over the ISO C standard.

63114 **NAME**

63115 sigaltstack ‡'set and get signal alternate stack context

63116 **SYNOPSIS**

63117 XSI
```
#include <signal.h>

int sigaltstack(const stack_t *restrict ss, stack_t *restrict oss);
```

63118

63119 **DESCRIPTION**

63120 The *sigaltstack*( ) function allows a process to define and examine the state of an alternate stack
63121 for signal handlers for the current thread. Signals that have been explicitly declared to execute
63122 on the alternate stack shall be delivered on the alternate stack.

63123 If *ss* is not a null pointer, it points to a **stack_t** structure that specifies the alternate signal stack
63124 that shall take effect upon return from *sigaltstack*( ). The *ss_flags* member specifies the new stack
63125 state. If it is set to SS_DISABLE, the stack is disabled and *ss_sp* and *ss_size* are ignored.
63126 Otherwise, the stack shall be enabled, and the *ss_sp* and *ss_size* members specify the new address
63127 and size of the stack.

63128 The range of addresses starting at *ss_sp* up to but not including *ss_sp*+*ss_size* is available to the
63129 implementation for use as the stack. This function makes no assumptions regarding which end
63130 is the stack base and in which direction the stack grows as items are pushed.

63131 If *oss* is not a null pointer, upon successful completion it shall point to a **stack_t** structure that
63132 specifies the alternate signal stack that was in effect prior to the call to *sigaltstack*( ). The *ss_sp*
63133 and *ss_size* members specify the address and size of that stack. The *ss_flags* member specifies the
63134 stack's state, and may contain one of the following values:

63135 SS_ONSTACK The process is currently executing on the alternate signal stack. Attempts to
63136 modify the alternate signal stack while the process is executing on it fail. This
63137 flag shall not be modified by processes.

63138 SS_DISABLE The alternate signal stack is currently disabled.

63139 The value SIGSTKSZ is a system default specifying the number of bytes that would be used to
63140 cover the usual case when manually allocating an alternate stack area. The value MINSIGSTKSZ
63141 is defined to be the minimum stack size for a signal handler. In computing an alternate stack
63142 size, a program should add that amount to its stack requirements to allow for the system
63143 implementation overhead. The constants SS_ONSTACK, SS_DISABLE, SIGSTKSZ, and
63144 MINSIGSTKSZ are defined in **<signal.h>**.

63145 After a successful call to one of the *exec* functions, there are no alternate signal stacks in the new
63146 process image.

63147 In some implementations, a signal (whether or not indicated to execute on the alternate stack)
63148 shall always execute on the alternate stack if it is delivered while another signal is being caught
63149 using the alternate stack.

63150 Use of this function by library threads that are not bound to kernel-scheduled entities results in
63151 undefined behavior.

63152 **RETURN VALUE**

63153 Upon successful completion, *sigaltstack*( ) shall return 0; otherwise, it shall return –1 and set *errno*
63154 to indicate the error.

63155 **ERRORS**

63156 The *sigaltstack*( ) function shall fail if:

63157 [EINVAL] The *ss* argument is not a null pointer, and the *ss_flags* member pointed to by *ss*
63158 contains flags other than SS_DISABLE.

63159 [ENOMEM] The size of the alternate stack area is less than MINSIGSTKSZ.

63160 [EPERM] An attempt was made to modify an active stack.

63161 **EXAMPLES**

63162 **Allocating Memory for an Alternate Stack**

63163 The following example illustrates a method for allocating memory for an alternate stack.

```
63164 #include <signal.h>
63165 ...
63166 if ((sigstk.ss_sp = malloc(SIGSTKSZ)) == NULL)
63167     /* Error return. */
63168 sigstk.ss_size = SIGSTKSZ;
63169 sigstk.ss_flags = 0;
63170 if (sigaltstack(&sigstk,(stack_t *)0) < 0)
63171     perror("sigaltstack");
```

63172 **APPLICATION USAGE**

63173 On some implementations, stack space is automatically extended as needed. On those
63174 implementations, automatic extension is typically not available for an alternate stack. If the stack
63175 overflows, the behavior is undefined.

63176 **RATIONALE**

63177 None.

63178 **FUTURE DIRECTIONS**

63179 None.

63180 **SEE ALSO**

63181 Section 2.4 (on page 488), *exec*, *sigaction*( ), *sigsetjmp*( )

63182 XBD **<signal.h>**

63183 **CHANGE HISTORY**

63184 First released in Issue 4, Version 2.

63185 **Issue 5**

63186 Moved from X/OPEN UNIX extension to BASE.

63187 The last sentence of the DESCRIPTION was included as an APPLICATION USAGE note in
63188 previous issues.

63189 **Issue 6**

63190 The normative text is updated to avoid use of the term ``must'' for application requirements.

63191 The **restrict** keyword is added to the *sigaltstack*( ) prototype for alignment with the
63192 ISO/IEC 9899: 1999 standard.

63193 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/58 is applied, updating the first sentence
63194 to include ``for the current thread''.

63195 **NAME**

63196 sigdelset — delete a signal from a signal set

63197 **SYNOPSIS**

63198 CX
```
#include <signal.h>

int sigdelset(sigset_t *set, int signo);
```

63200 **DESCRIPTION**

63201 The *sigdelset*( ) function deletes the individual signal specified by *signo* from the signal set
63202 pointed to by *set*.

63203 Applications should call either *sigemptyset*( ) or *sigfillset*( ) at least once for each object of type
63204 **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is
63205 nonetheless supplied as an argument to any of *pthread_sigmask*( ), *sigaction*( ), *sigaddset*( ),
63206 *sigdelset*( ), *sigismember*( ), *sigpending*( ), *sigprocmask*( ), *sigsuspend*( ), *sigtimedwait*( ), *sigwait*( ), or
63207 *sigwaitinfo*( ), the results are undefined.

63208 **RETURN VALUE**

63209 Upon successful completion, *sigdelset*( ) shall return 0; otherwise, it shall return −1 and set *errno*
63210 to indicate the error.

63211 **ERRORS**

63212 The *sigdelset*( ) function may fail if:

63213 [EINVAL] The *signo* argument is not a valid signal number, or is an unsupported signal
63214 number.

63215 **EXAMPLES**

63216 None.

63217 **APPLICATION USAGE**

63218 None.

63219 **RATIONALE**

63220 None.

63226 XBD **<signal.h>**

63227 **CHANGE HISTORY**

63228 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

63229 **Issue 5**

63230 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
63231 previous issues.

63232 **Issue 6**

63233 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
63234 extension over the ISO C standard.

63235 **NAME**

63236 sigemptyset ‡'initialize and empty a signal set

63237 **SYNOPSIS**

63238 CX
```
#include <signal.h>

int sigemptyset(sigset_t *set);
```
63239

63240 **DESCRIPTION**

63241 The *sigemptyset*( ) function initializes the signal set pointed to by *set*, such that all signals defined
63242 in POSIX.1-2017 are excluded.

63243 **RETURN VALUE**

63244 Upon successful completion, *sigemptyset*( ) shall return 0; otherwise, it shall return –1 and set
63245 *errno* to indicate the error.

63246 **ERRORS**

63247 No errors are defined.

63248 **EXAMPLES**

63249 None.

63250 **APPLICATION USAGE**

63251 None.

63252 **RATIONALE**

63253 The implementation of the *sigemptyset*( ) (or *sigfillset*( )) function could quite trivially clear (or set)
63254 all the bits in the signal set. Alternatively, it would be reasonable to initialize part of the
63255 structure, such as a version field, to permit binary-compatibility between releases where the size
63256 of the set varies. For such reasons, either *sigemptyset*( ) or *sigfillset*( ) must be called prior to any
63257 other use of the signal set, even if such use is read-only (for example, as an argument to
63258 *sigpending*( )). This function is not intended for dynamic allocation.

63259 The *sigfillset*( ) and *sigemptyset*( ) functions require that the resulting signal set include (or
63260 exclude) all the signals defined in this volume of POSIX.1-2017. Although it is outside the scope
63261 of this volume of POSIX.1-2017 to place this requirement on signals that are implemented as
63262 extensions, it is recommended that implementation-defined signals also be affected by these
63263 functions. However, there may be a good reason for a particular signal not to be affected. For
63264 example, blocking or ignoring an implementation-defined signal may have undesirable side-
63265 effects, whereas the default action for that signal is harmless. In such a case, it would be
63266 preferable for such a signal to be excluded from the signal set returned by *sigfillset*( ).

63267 In early proposals there was no distinction between invalid and unsupported signals (the names
63268 of optional signals that were not supported by an implementation were not defined by that
63269 implementation). The [EINVAL] error was thus specified as a required error for invalid signals.
63270 With that distinction, it is not necessary to require implementations of these functions to
63271 determine whether an optional signal is actually supported, as that could have a significant
63272 performance impact for little value. The error could have been required for invalid signals and
63273 optional for unsupported signals, but this seemed unnecessarily complex. Thus, the error is
63274 optional in both cases.

63275 **FUTURE DIRECTIONS**

63276 None.

63281 **CHANGE HISTORY**

63282 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

63283 **Issue 6**

63284 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
63285 extension over the ISO C standard.

63286 **NAME**

63287 sigfillset ‡'initialize and fill a signal set

63288 **SYNOPSIS**

63289 CX
```
#include <signal.h>

int sigfillset(sigset_t *set);
```
63290

63291 **DESCRIPTION**

63292 The *sigfillset*( ) function shall initialize the signal set pointed to by *set*, such that all signals
63293 defined in this volume of POSIX.1-2017 are included.

63294 **RETURN VALUE**

63295 Upon successful completion, *sigfillset*( ) shall return 0; otherwise, it shall return –1 and set *errno*
63296 to indicate the error.

63297 **ERRORS**

63298 No errors are defined.

63299 **EXAMPLES**

63300 None.

63301 **APPLICATION USAGE**

63302 None.

63303 **RATIONALE**

63304 Refer to *sigemptyset*( ) (on page 1961).

63310 XBD **<signal.h>**

63311 **CHANGE HISTORY**

63312 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

63313 **Issue 6**

63314 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
63315 extension over the ISO C standard.

63316 **NAME**

63317 sighold, sigignore, sigpause, sigrelse, sigset — signal management

63318 **SYNOPSIS**

63319 OB XSI
```
#include <signal.h>

int sighold(int sig);
int sigignore(int sig);
int sigpause(int sig);
int sigrelse(int sig);
void (*sigset(int sig, void (*disp)(int)))(int);
```

63325 **DESCRIPTION**

63326 Use of any of these functions is unspecified in a multi-threaded process.

63327 The *sighold*( ), *sigignore*( ), *sigpause*( ), *sigrelse*( ), and *sigset*( ) functions provide simplified signal
63328 management.

63329 The *sigset*( ) function shall modify signal dispositions. The *sig* argument specifies the signal,
63330 which may be any signal except SIGKILL and SIGSTOP. The *disp* argument specifies the signal's
63331 disposition, which may be SIG_DFL, SIG_IGN, or the address of a signal handler. If *sigset*( ) is
63332 used, and *disp* is the address of a signal handler, the system shall add *sig* to the signal mask of
63333 the calling process before executing the signal handler; when the signal handler returns, the
63334 system shall restore the signal mask of the calling process to its state prior to the delivery of the
63335 signal. In addition, if *sigset*( ) is used, and *disp* is equal to SIG_HOLD, *sig* shall be added to the
63336 signal mask of the calling process and *sig*'s disposition shall remain unchanged. If *sigset*( ) is
63337 used, and *disp* is not equal to SIG_HOLD, *sig* shall be removed from the signal mask of the
63338 calling process.

63339 The *sighold*( ) function shall add *sig* to the signal mask of the calling process.

63340 The *sigrelse*( ) function shall remove *sig* from the signal mask of the calling process.

63341 The *sigignore*( ) function shall set the disposition of *sig* to SIG_IGN.

63342 The *sigpause*( ) function shall remove *sig* from the signal mask of the calling process and suspend
63343 the calling process until a signal is received. The *sigpause*( ) function shall restore the signal mask
63344 of the process to its original state before returning.

63345 If the action for the SIGCHLD signal is set to SIG_IGN, child processes of the calling processes
63346 shall not be transformed into zombie processes when they terminate. If the calling process
63347 subsequently waits for its children, and the process has no unwaited-for children that were
63348 transformed into zombie processes, it shall block until all of its children terminate, and *wait*( ),
63349 *waitid*( ), and *waitpid*( ) shall fail and set *errno* to [ECHILD].

63350 **RETURN VALUE**

63351 Upon successful completion, *sigset*( ) shall return SIG_HOLD if the signal had been blocked and
63352 the signal's previous disposition if it had not been blocked. Otherwise, SIG_ERR shall be
63353 returned and *errno* set to indicate the error.

63354 The *sigpause*( ) function shall suspend execution of the thread until a signal is received,
63355 whereupon it shall return –1 and set *errno* to [EINTR].

63356 For all other functions, upon successful completion, 0 shall be returned. Otherwise, –1 shall be
63357 returned and *errno* set to indicate the error.

ERRORS

These functions shall fail if:

[EINVAL] The *sig* argument is an illegal signal number.

The *sigset*( ) and *sigignore*( ) functions shall fail if:

[EINVAL] An attempt is made to catch a signal that cannot be caught, or to ignore a signal that cannot be ignored.

EXAMPLES

None.

APPLICATION USAGE

The *sigaction*( ) function provides a more comprehensive and reliable mechanism for controlling signals; new applications should use the *sigaction*( ) function instead of the obsolescent *sigset*( ) function.

The *sighold*( ) function, in conjunction with *sigrelse*( ) or *sigpause*( ), may be used to establish critical regions of code that require the delivery of a signal to be temporarily deferred. For broader portability, the *pthread_sigmask*( ) or *sigprocmask*( ) functions should be used instead of the obsolescent *sighold*( ) and *sigrelse*( ) functions.

For broader portability, the *sigsuspend*( ) function should be used instead of the obsolescent *sigpause*( ) function.

RATIONALE

Each of these historic functions has a direct analog in the other functions which are required to be per-thread and thread-safe (aside from *sigprocmask*( ), which is replaced by *pthread_sigmask*( )). The *sigset*( ) function can be implemented as a simple wrapper for *sigaction*( ). The *sighold*( ) function is equivalent to *sigprocmask*( ) or *pthread_sigmask*( ) with SIG_BLOCK set. The *sigignore*( ) function is equivalent to *sigaction*( ) with SIG_IGN set. The *sigpause*( ) function is equivalent to *sigsuspend*( ). The *sigrelse*( ) function is equivalent to *sigprocmask*( ) or *pthread_sigmask*( ) with SIG_UNBLOCK set.

FUTURE DIRECTIONS

These functions may be removed in a future version.

XBD **<signal.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The DESCRIPTION is updated to indicate that the *sigpause*( ) function restores the signal mask of the process to its original state before returning.

The RETURN VALUE section is updated to indicate that the *sigpause*( ) function suspends execution of the process until a signal is received, whereupon it returns –1 and sets *errno* to [EINTR].

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

References to the *wait3*( ) function are removed.

The XSI functions are split out into their own reference page.

Issue 7

SD5-XSH-ERN-113 and SD5-XSH-ERN-42 are applied, marking these functions obsolescent and updating the APPLICATION USAGE and RATIONALE sections.

NAME

siginterrupt — allow signals to interrupt functions

SYNOPSIS

OB XSI

```
#include <signal.h>

int siginterrupt(int sig, int flag);
```

DESCRIPTION

The *siginterrupt*( ) function shall change the restart behavior when a function is interrupted by the specified signal. The function *siginterrupt*(*sig*, *flag*) has an effect as if implemented as:

```
int siginterrupt(int sig, int flag) {
    int ret;
    struct sigaction act;

    (void) sigaction(sig, NULL, &act);
    if (flag)
        act.sa_flags &= ~SA_RESTART;
    else
        act.sa_flags |= SA_RESTART;
    ret = sigaction(sig, &act, NULL);
    return ret;
}
```

RETURN VALUE

Upon successful completion, *siginterrupt*( ) shall return 0; otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *siginterrupt*( ) function shall fail if:

[EINVAL] The *sig* argument is not a valid signal number.

EXAMPLES

None.

APPLICATION USAGE

The *siginterrupt*( ) function supports programs written to historical system interfaces. Applications should use the *sigaction*( ) with the SA_RESTART flag instead of the obsolescent *siginterrupt*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<signal.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

63446 **Issue 5**

63447 Moved from X/OPEN UNIX extension to BASE.

63448 **Issue 6**

63449 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/59 is applied, correcting the declaration in
63450 the sample implementation given in the DESCRIPTION.

63451 **Issue 7**

63452 The *siginterrupt*( ) function is marked obsolescent.

63453 **NAME**

63454 sigismember ‡'test for a signal in a signal set

63455 **SYNOPSIS**

63456 CX
```
#include <signal.h>

int sigismember(const sigset_t *set, int signo);
```
63457

63458 **DESCRIPTION**

63459 The *sigismember*( ) function shall test whether the signal specified by *signo* is a member of the set
63460 pointed to by *set*.

63461 Applications should call either *sigemptyset*( ) or *sigfillset*( ) at least once for each object of type
63462 **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is
63463 nonetheless supplied as an argument to any of *pthread_sigmask*( ), *sigaction*( ), *sigaddset*( ),
63464 *sigdelset*( ), *sigismember*( ), *sigpending*( ), *sigprocmask*( ), *sigsuspend*( ), *sigtimedwait*( ), *sigwait*( ), or
63465 *sigwaitinfo*( ), the results are undefined.

63466 **RETURN VALUE**

63467 Upon successful completion, *sigismember*( ) shall return 1 if the specified signal is a member of
63468 the specified set, or 0 if it is not. Otherwise, it shall return –1 and set *errno* to indicate the error.

63469 **ERRORS**

63470 The *sigismember*( ) function may fail if:

63471 [EINVAL] The *signo* argument is not a valid signal number, or is an unsupported signal
63472 number.

63473 **EXAMPLES**

63474 None.

63475 **APPLICATION USAGE**

63476 None.

63477 **RATIONALE**

63478 None.

63479 **FUTURE DIRECTIONS**

63480 None.

63481 **SEE ALSO**

63482 Section 2.4 (on page 488), *pthread_sigmask*( ), *sigaction*( ), *sigaddset*( ), *sigdelset*( ), *sigfillset*( ),
63483 *sigemptyset*( ), *sigpending*( ), *sigsuspend*( )

63484 XBD **<signal.h>**

63485 **CHANGE HISTORY**

63486 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

63487 **Issue 5**

63488 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
63489 previous issues.

63490 **Issue 6**

63491 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
63492 extension over the ISO C standard.

63493 **NAME**

63494 siglongjmp ‡'non-local goto with signal handling

63495 **SYNOPSIS**

63496 CX
```
#include <setjmp.h>

void siglongjmp(sigjmp_buf env, int val);
```

63498 **DESCRIPTION**

63499 The *siglongjmp*( ) function shall be equivalent to the *longjmp*( ) function, except as follows:

63500 References to *setjmp*( ) shall be equivalent to *sigsetjmp*( ).

63501 The *siglongjmp*( ) function shall restore the saved signal mask if and only if the *env*
63502 argument was initialized by a call to *sigsetjmp*( ) with a non-zero *savemask* argument.

63503 **RETURN VALUE**

63504 After *siglongjmp*( ) is completed, program execution shall continue as if the corresponding
63505 invocation of *sigsetjmp*( ) had just returned the value specified by *val*. The *siglongjmp*( ) function
63506 shall not cause *sigsetjmp*( ) to return 0; if *val* is 0, *sigsetjmp*( ) shall return the value 1.

63507 **ERRORS**

63508 No errors are defined.

63509 **EXAMPLES**

63510 None.

63511 **APPLICATION USAGE**

63512 The distinction between *setjmp*( ) or *longjmp*( ) and *sigsetjmp*( ) or *siglongjmp*( ) is only significant
63513 for programs which use *sigaction*( ), *sigprocmask*( ), or *sigsuspend*( ).

63514 **RATIONALE**

63515 None.

63516 **FUTURE DIRECTIONS**

63517 None.

63518 **SEE ALSO**

63519 *longjmp*( ), *pthread_sigmask*( ), *setjmp*( ), *sigsetjmp*( ), *sigsuspend*( )

63520 XBD **<setjmp.h>**

63521 **CHANGE HISTORY**

63522 First released in Issue 3. Included for alignment with the ISO POSIX-1 standard.

63523 **Issue 5**

63524 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

63525 **Issue 6**

63526 The DESCRIPTION is rewritten in terms of *longjmp*( ).

63527 The SYNOPSIS is marked CX since the presence of this function in the **<setjmp.h>** header is an
63528 extension over the ISO C standard.

63529 **NAME**

63530 signal ‡'signal management

63531 **SYNOPSIS**

63532 `#include <signal.h>`

63533 `void (*signal(int sig, void (*func)(int)))(int);`

63534 **DESCRIPTION**

63535 CX The functionality described on this reference page is aligned with the ISO C standard. Any
63536 conflict between the requirements described here and the ISO C standard is unintentional. This
63537 volume of POSIX.1-2017 defers to the ISO C standard.

63538 The *signal*( ) function chooses one of three ways in which receipt of the signal number *sig* is to be
63539 subsequently handled. If the value of *func* is SIG_DFL, default handling for that signal shall
63540 occur. If the value of *func* is SIG_IGN, the signal shall be ignored. Otherwise, the application
63541 shall ensure that *func* points to a function to be called when that signal occurs. An invocation of
63542 such a function because of a signal, or (recursively) of any further functions called by that
63543 invocation (other than functions in the standard library), is called a ``signal handler''.

63544 When a signal occurs, and *func* points to a function, it is implementation-defined whether the
63545 equivalent of a:

63546 `signal(sig, SIG_DFL);`

63547 is executed or the implementation prevents some implementation-defined set of signals (at least
63548 including *sig*) from occurring until the current signal handling has completed. (If the value of *sig*
63549 is SIGILL, the implementation may alternatively define that no action is taken.) Next the
63550 equivalent of:

63551 `(*func)(sig);`

63552 is executed. If and when the function returns, if the value of *sig* was SIGFPE, SIGILL, or
63553 SIGSEGV or any other implementation-defined value corresponding to a computational
63554 exception, the behavior is undefined. Otherwise, the program shall resume execution at the
63555 point it was interrupted. The ISO C standard places a restriction on applications relating to the
63556 CX use of *raise*( ) from signal handlers. This restriction does not apply to POSIX applications, as
63557 POSIX.1-2017 requires *raise*( ) to be async-signal-safe (see Section 2.4.3, on page 490).

63558 CX If the process is multi-threaded, or if the process is single-threaded and a signal handler is
63559 executed other than as the result of:

63560 CX — The process calling *abort*( ), *raise*( ), *kill*( ), *pthread_kill*( ), or *sigqueue*( ) to generate a signal
63561 that is not blocked

63562 CX — A pending signal being unblocked and being delivered before the call that unblocked it
63563 returns

63564 CX the behavior is undefined if the signal handler refers to any object other than *errno* with static
63565 storage duration other than by assigning a value to an object declared as **volatile sig_atomic_t**,
63566 CX or if the signal handler calls any function defined in this standard other than one of the
63567 functions listed in Section 2.4 (on page 488).

63568 At program start-up, the equivalent of:

63569 `signal(sig, SIG_IGN);`

63570 is executed for some signals, and the equivalent of:

63571 `signal(sig, SIG_DFL);`

63572 CX is executed for all other signals (see *exec*).

63573 The *signal*( ) function shall not change the setting of *errno* if successful.

63574 **RETURN VALUE**

63575 If the request can be honored, *signal*( ) shall return the value of *func* for the most recent call to
63576 *signal*( ) for the specified signal *sig*. Otherwise, SIG_ERR shall be returned and a positive value
63577 shall be stored in *errno*.

63578 **ERRORS**

63579 The *signal*( ) function shall fail if:

63580 CX [EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a
63581 signal that cannot be caught or ignore a signal that cannot be ignored.

63582 The *signal*( ) function may fail if:

63583 CX [EINVAL] An attempt was made to set the action to SIG_DFL for a signal that cannot be
63584 caught or ignored (or both).

63585 **EXAMPLES**

63586 None.

63587 **APPLICATION USAGE**

63588 The *sigaction*( ) function provides a more comprehensive and reliable mechanism for controlling
63589 signals; new applications should use *sigaction*( ) rather than *signal*( ).

63590 **RATIONALE**

63591 None.

63592 **FUTURE DIRECTIONS**

63593 None.

63594 **SEE ALSO**

63595 Section 2.4 (on page 488), *exec*, *pause*( ), *raise*( ), *sigaction*( ), *sigsuspend*( ), *waitid*( )

63596 XBD **<signal.h>**

63597 **CHANGE HISTORY**

63598 First released in Issue 1. Derived from Issue 1 of the SVID.

63599 **Issue 5**

63600 Moved from X/OPEN UNIX extension to BASE.

63601 The DESCRIPTION is updated to indicate that the *sigpause*( ) function restores the signal mask of
63602 the process to its original state before returning.

63603 The RETURN VALUE section is updated to indicate that the *sigpause*( ) function suspends
63604 execution of the process until a signal is received, whereupon it returns –1 and sets *errno* to
63605 [EINTR].

63606 **Issue 6**

63607 Extensions beyond the ISO C standard are marked.

63608 The normative text is updated to avoid use of the term ``must'' for application requirements.

63609 The DESCRIPTION is updated for alignment with the ISO/IEC 9899: 1999 standard.

63610 References to the *wait3*( ) function are removed.

63611 The *sighold*( ), *sigignore*( ), *sigrelse*( ), and *sigset*( ) functions are split out onto their own reference
63612 page.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0580 [275], XSH/TC1-2008/0581 [66], and XSH/TC1-2008/0582 [105] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0331 [785] is applied.

63617 **NAME**

63618 signbit ‡'test sign

63619 **SYNOPSIS**

63620 `#include <math.h>`

63621 `int signbit(real-floating x);`

63622 **DESCRIPTION**

63623 CX The functionality described on this reference page is aligned with the ISO C standard. Any
63624 conflict between the requirements described here and the ISO C standard is unintentional. This
63625 volume of POSIX.1-2017 defers to the ISO C standard.

63626 The *signbit*( ) macro shall determine whether the sign of its argument value is negative. NaNs,
63627 zeros, and infinities have a sign bit.

63628 **RETURN VALUE**

63629 The *signbit*( ) macro shall return a non-zero value if and only if the sign of its argument value is
63630 negative.

63631 **ERRORS**

63632 No errors are defined.

63633 **EXAMPLES**

63634 None.

63635 **APPLICATION USAGE**

NAME

signgam ‡ log gamma function

SYNOPSIS

XSI

```
#include <math.h>

extern int signgam;
```

DESCRIPTION

Refer to *lgamma( )*.

63653 **NAME**

63654 sigpause — remove a signal from the signal mask and suspend the thread

63655 **SYNOPSIS**

63656 OB XSI
```
#include <signal.h>

int sigpause(int sig);
```
63657

63658 **DESCRIPTION**

63659 Refer to *sighold( )*.

63660 **NAME**

63661 sigpending ‡'examine pending signals

63662 **SYNOPSIS**

63663 CX
```
#include <signal.h>

int sigpending(sigset_t *set);
```
63664

63665 **DESCRIPTION**

63666 The *sigpending*( ) function shall store, in the location referenced by the *set* argument, the set of
63667 signals that are blocked from delivery to the calling thread and that are pending on the process
63668 or the calling thread.

63669 **RETURN VALUE**

63670 Upon successful completion, *sigpending*( ) shall return 0; otherwise, −1 shall be returned and
63671 *errno* set to indicate the error.

63672 **ERRORS**

63673 No errors are defined.

63674 **EXAMPLES**

63675 None.

63676 **APPLICATION USAGE**

63677 None.

63678 **RATIONALE**

63679 None.

63680 **FUTURE DIRECTIONS**

63683 *exec*, *pthread_sigmask*( ), *sigaddset*( ), *sigdelset*( ), *sigemptyset*( ), *sigfillset*( ), *sigismember*( )

63684 XBD **<signal.h>**

63685 **CHANGE HISTORY**

63686 First released in Issue 3.

63687 **Issue 5**

63688 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

63689 **Issue 6**

63690 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
63691 extension over the ISO C standard.

63692 **NAME**

63693 sigprocmask — examine and change blocked signals

63694 **SYNOPSIS**

63695 CX
```
#include <signal.h>

int sigprocmask(int how, const sigset_t *restrict set,
    sigset_t *restrict oset);
```

63698 **DESCRIPTION**

63699 Refer to *pthread_sigmask( )*.

63700 **NAME**

63701 sigqueue — queue a signal to a process

63702 **SYNOPSIS**

63703 CX
```
#include <signal.h>

int sigqueue(pid_t pid, int signo, union sigval value);
```
63704

63705 **DESCRIPTION**

63706 The *sigqueue*( ) function shall cause the signal specified by *signo* to be sent with the value
63707 specified by *value* to the process specified by *pid*. If *signo* is zero (the null signal), error checking
63708 is performed but no signal is actually sent. The null signal can be used to check the validity of
63709 *pid*.

63710 The conditions required for a process to have permission to queue a signal to another process are
63711 the same as for the *kill*( ) function.

63712 The *sigqueue*( ) function shall return immediately. If SA_SIGINFO is set for *signo* and if the
63713 resources were available to queue the signal, the signal shall be queued and sent to the receiving
63714 process. If SA_SIGINFO is not set for *signo*, then *signo* shall be sent at least once to the receiving
63715 process; it is unspecified whether *value* shall be sent to the receiving process as a result of this
63716 call.

63717 If the value of *pid* causes *signo* to be generated for the sending process, and if *signo* is not blocked
63718 for the calling thread and if no other thread has *signo* unblocked or is waiting in a *sigwait*( )
63719 function for *signo*, either *signo* or at least the pending, unblocked signal shall be delivered to the
63720 calling thread before the *sigqueue*( ) function returns. Should any multiple pending signals in the
63721 range SIGRTMIN to SIGRTMAX be selected for delivery, it shall be the lowest numbered one.
63722 The selection order between realtime and non-realtime signals, or between multiple pending
63723 non-realtime signals, is unspecified.

63724 **RETURN VALUE**

63725 Upon successful completion, the specified signal shall have been queued, and the *sigqueue*( )
63726 function shall return a value of zero. Otherwise, the function shall return a value of −1 and set
63727 *errno* to indicate the error.

63728 **ERRORS**

63729 The *sigqueue*( ) function shall fail if:

63730 [EAGAIN] No resources are available to queue the signal. The process has already
63731 queued {SIGQUEUE_MAX} signals that are still pending at the receiver(s), or
63732 a system-wide resource limit has been exceeded.

63733 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

63734 [EPERM] The process does not have appropriate privileges to send the signal to the
63735 receiving process.

63736 [ESRCH] The process *pid* does not exist.

63737 **EXAMPLES**

63738 None.

63739 **APPLICATION USAGE**

63740 None.

63741 **RATIONALE**

63742 The *sigqueue*( ) function allows an application to queue a realtime signal to itself or to another
63743 process, specifying the application-defined value. This is common practice in realtime
63744 applications on existing realtime systems. It was felt that specifying another function in the
63745 *sig*... name space already carved out for signals was preferable to extending the interface to
63746 *kill*( ).

63747 Such a function became necessary when the put/get event function of the message queues was
63748 removed. It should be noted that the *sigqueue*( ) function implies reduced performance in a
63749 security-conscious implementation as the access permissions between the sender and receiver
63750 have to be checked on each send when the *pid* is resolved into a target process. Such access
63751 checks were necessary only at message queue open in the previous interface.

63752 The standard developers required that *sigqueue*( ) have the same semantics with respect to the
63753 null signal as *kill*( ), and that the same permission checking be used. But because of the difficulty
63754 of implementing the ``broadcast'' semantic of *kill*( ) (for example, to process groups) and the
63755 interaction with resource allocation, this semantic was not adopted. The *sigqueue*( ) function
63756 queues a signal to a single process specified by the *pid* argument.

63757 The *sigqueue*( ) function can fail if the system has insufficient resources to queue the signal. An
63758 explicit limit on the number of queued signals that a process could send was introduced. While
63759 the limit is ``per-sender'', this volume of POSIX.1-2017 does not specify that the resources be part
63760 of the state of the sender. This would require either that the sender be maintained after exit until
63761 all signals that it had sent to other processes were handled or that all such signals that had not
63762 yet been acted upon be removed from the queue(s) of the receivers. This volume of
63763 POSIX.1-2017 does not preclude this behavior, but an implementation that allocated queuing
63764 resources from a system-wide pool (with per-sender limits) and that leaves queued signals
63765 pending after the sender exits is also permitted.

63766 **FUTURE DIRECTIONS**

63767 None.

63768 **SEE ALSO**

63769 Section 2.8.1 (on page 503)

63770 XBD **<signal.h>**

63771 **CHANGE HISTORY**

63772 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the
63773 POSIX Threads Extension.

63774 **Issue 6**

63775 The *sigqueue*( ) function is marked as part of the Realtime Signals Extension option.

63776 The [ENOSYS] error condition has been removed as stubs need not be provided if an
63777 implementation does not support the Realtime Signals Extension option.

63778 **Issue 7**

63779 The *sigqueue*( ) function is moved from the Realtime Signals Extension option to the Base.

63780 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0332 [844] is applied.

NAME

sigrelse, sigset — signal management

SYNOPSIS

OB XSI

```
#include <signal.h>

int sigrelse(int sig);
void (*sigset(int sig, void (*disp)(int)))(int);
```

DESCRIPTION

Refer to *sighold( )*.

63789 **NAME**

63790 sigsetjmp ‡'set jump point for a non-local goto

63791 **SYNOPSIS**

63792 CX
```
#include <setjmp.h>

int sigsetjmp(sigjmp_buf env, int savemask);
```
63793

63794 **DESCRIPTION**

63795 The *sigsetjmp*( ) function shall be equivalent to the *setjmp*( ) function, except as follows:

63796 References to *setjmp*( ) are equivalent to *sigsetjmp*( ).

63797 References to *longjmp*( ) are equivalent to *siglongjmp*( ).

63798 63799 If the value of the *savemask* argument is not 0, *sigsetjmp*( ) shall also save the current signal mask of the calling thread as part of the calling environment.

63800 **RETURN VALUE**

63801 63802 If the return is from a successful direct invocation, *sigsetjmp*( ) shall return 0. If the return is from a call to *siglongjmp*( ), *sigsetjmp*( ) shall return a non-zero value.

63803 **ERRORS**

63804 No errors are defined.

63805 **EXAMPLES**

63806 None.

63807 **APPLICATION USAGE**

63808 63809 The distinction between *setjmp*( )/*longjmp*( ) and *sigsetjmp*( )/*siglongjmp*( ) is only significant for programs which use *sigaction*( ), *sigprocmask*( ), or *sigsuspend*( ).

63810 63811 Note that since this function is defined in terms of *setjmp*( ), if *savemask* is zero, it is unspecified whether the signal mask is saved.

63812 **RATIONALE**

63813 63814 63815 The ISO C standard specifies various restrictions on the usage of the *setjmp*( ) macro in order to permit implementors to recognize the name in the compiler and not implement an actual function. These same restrictions apply to the *sigsetjmp*( ) macro.

63816 63817 There are processors that cannot easily support these calls, but this was not considered a sufficient reason to exclude them.

63818 63819 63820 63821 63822 63823 63824 4.2 BSD, 4.3 BSD, and XSI-conformant systems provide functions named *_setjmp*( ) and *_longjmp*( ) that, together with *setjmp*( ) and *longjmp*( ), provide the same functionality as *sigsetjmp*( ) and *siglongjmp*( ). On those systems, *setjmp*( ) and *longjmp*( ) save and restore signal masks, while *_setjmp*( ) and *_longjmp*( ) do not. On System V Release 3 and in corresponding issues of the SVID, *setjmp*( ) and *longjmp*( ) are explicitly defined not to save and restore signal masks. In order to permit existing practice in both cases, the relation of *setjmp*( ) and *longjmp*( ) to signal masks is not specified, and a new set of functions is defined instead.

63825 63826 63827 63828 The *longjmp*( ) and *siglongjmp*( ) functions operate as in the previous issue provided the matching *setjmp*( ) or *sigsetjmp*( ) has been performed in the same thread. Non-local jumps into contexts saved by other threads would be at best a questionable practice and were not considered worthy of standardization.

63829 **FUTURE DIRECTIONS**

63830 None.

63831 **SEE ALSO**

63832 *pthread_sigmask*( ), *siglongjmp*( ), *signal*( ), *sigsuspend*( )

63833 XBD **<setjmp.h>**

63834 **CHANGE HISTORY**

63835 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

63836 **Issue 5**

63837 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

63838 **Issue 6**

63839 The DESCRIPTION is reworded in terms of *setjmp*( ).

63840 The SYNOPSIS is marked CX since the presence of this function in the **<setjmp.h>** header is an
63841 extension over the ISO C standard.

63842 **NAME**

63843 sigsuspend ‡'wait for a signal

63844 **SYNOPSIS**

63845 CX
```
#include <signal.h>

int sigsuspend(const sigset_t *sigmask);
```

63846

63847 **DESCRIPTION**

63848 The *sigsuspend*( ) function shall replace the current signal mask of the calling thread with the set
63849 of signals pointed to by *sigmask* and then suspend the thread until delivery of a signal whose
63850 action is either to execute a signal-catching function or to terminate the process. This shall not
63851 cause any other signals that may have been pending on the process to become pending on the
63852 thread.

63853 If the action is to terminate the process then *sigsuspend*( ) shall never return. If the action is to
63854 execute a signal-catching function, then *sigsuspend*( ) shall return after the signal-catching
63855 function returns, with the signal mask restored to the set that existed prior to the *sigsuspend*( )
63856 call.

63857 It is not possible to block signals that cannot be ignored. This is enforced by the system without
63858 causing an error to be indicated.

63859 **RETURN VALUE**

63860 Since *sigsuspend*( ) suspends thread execution indefinitely, there is no successful completion
63861 return value. If a return occurs, –1 shall be returned and *errno* set to indicate the error.

63862 **ERRORS**

63863 The *sigsuspend*( ) function shall fail if:

63864 [EINTR] A signal is caught by the calling process and control is returned from the
63865 signal-catching function.

63866 **EXAMPLES**

63867 None.

63868 **APPLICATION USAGE**

63869 Normally, at the beginning of a critical code section, a specified set of signals is blocked using
63870 the *sigprocmask*( ) function. When the thread has completed the critical section and needs to wait
63871 for the previously blocked signal(s), it pauses by calling *sigsuspend*( ) with the mask that was
63872 returned by the *sigprocmask*( ) call.

63873 **RATIONALE**

63874 Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers
63875 can install an additional cancellation handler which resets the signal mask to the expected value.

```
63876 void cleanup(void *arg)
63877 {
63878     sigset_t *ss = (sigset_t *) arg;
63879     pthread_sigmask(SIG_SETMASK, ss, NULL);
63880 }

63881 int call_sigsuspend(const sigset_t *mask)
63882 {
63883     sigset_t oldmask;
63884     int result;
63885     pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
63886     pthread_cleanup_push(cleanup, &oldmask);
```

```
            result = sigsuspend(sigmask);
            pthread_cleanup_pop(0);
            return result;
        }
```

FUTURE DIRECTIONS

None.

XBD **<signal.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The text in the RETURN VALUE section has been changed from ``suspends process execution'' to ``suspends thread execution''. This reflects IEEE PASC Interpretation 1003.1c #40.

Text in the APPLICATION USAGE section has been replaced.

The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an extension over the ISO C standard.

Issue 7

SD5-XSH-ERN-122 is applied, adding the example code in the RATIONALE.

63908 **NAME**

63909 sigtimedwait, sigwaitinfo ‡'wait for queued signals

63910 **SYNOPSIS**

63911 CX
```
#include <signal.h>

int sigtimedwait(const sigset_t *restrict set,
    siginfo_t *restrict info,
    const struct timespec *restrict timeout);
int sigwaitinfo(const sigset_t *restrict set,
    siginfo_t *restrict info);
```

63917 **DESCRIPTION**

63918 The *sigtimedwait*( ) function shall be equivalent to *sigwaitinfo*( ) except that if none of the signals
63919 specified by *set* are pending, *sigtimedwait*( ) shall wait for the time interval specified in the
63920 **timespec** structure referenced by *timeout*. If the **timespec** structure pointed to by *timeout* is zero-
63921 valued and if none of the signals specified by *set* are pending, then *sigtimedwait*( ) shall return
63922 MON immediately with an error. If *timeout* is the null pointer, the behavior is unspecified. If the
63923 Monotonic Clock option is supported, the CLOCK_MONOTONIC clock shall be used to
63924 measure the time interval specified by the *timeout* argument.

63925 The *sigwaitinfo*( ) function selects the pending signal from the set specified by *set*. Should any of
63926 multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it shall be the
63927 lowest numbered one. The selection order between realtime and non-realtime signals, or
63928 between multiple pending non-realtime signals, is unspecified. If no signal in *set* is pending at
63929 the time of the call, the calling thread shall be suspended until one or more signals in *set* become
63930 pending or until it is interrupted by an unblocked, caught signal.

63931 The *sigwaitinfo*( ) function shall be equivalent to the *sigwait*( ) function, except that the return
63932 value and the error reporting method are different (see RETURN VALUE), and that if the *info*
63933 argument is non-NULL, the selected signal number shall be stored in the *si_signo* member, and
63934 the cause of the signal shall be stored in the *si_code* member. If any value is queued to the
63935 selected signal, the first such queued value shall be dequeued and, if the *info* argument is non-
63936 NULL, the value shall be stored in the *si_value* member of *info*. The system resource used to
63937 queue the signal shall be released and returned to the system for other use. If no value is
63938 queued, the content of the *si_value* member is undefined. If no further signals are queued for the
63939 selected signal, the pending indication for that signal shall be reset.

63940 **RETURN VALUE**

63941 Upon successful completion (that is, one of the signals specified by *set* is pending or is
63942 generated) *sigwaitinfo*( ) and *sigtimedwait*( ) shall return the selected signal number. Otherwise,
63943 the function shall return a value of −1 and set *errno* to indicate the error.

63944 **ERRORS**

63945 The *sigtimedwait*( ) function shall fail if:

63946 [EAGAIN] No signal specified by *set* was generated within the specified timeout period.

63947 The *sigtimedwait*( ) and *sigwaitinfo*( ) functions may fail if:

63948 [EINTR] The wait was interrupted by an unblocked, caught signal. It shall be
63949 documented in system documentation whether this error causes these
63950 functions to fail.

The *sigtimedwait*( ) function may also fail if:

[EINVAL] The *timeout* argument specified a *tv_nsec* value less than zero or greater than or equal to 1 000 million.

An implementation should only check for this error if no signal is pending in *set* and it is necessary to wait.

EXAMPLES

None.

APPLICATION USAGE

The *sigtimedwait*( ) function times out and returns an [EAGAIN] error. Application developers should note that this is inconsistent with other functions such as *pthread_cond_timedwait*( ) that return [ETIMEDOUT].

Note that in order to ensure that generated signals are queued and signal values passed to *sigqueue*( ) are available in *si_value*, applications which use *sigwaitinfo*( ) or *sigtimedwait*( ) need to set the SA_SIGINFO flag for each signal in the set (see Section 2.4, on page 488). This means setting each signal to be handled by a three-argument signal-catching function, even if the handler will never be called. It is not possible (portably) to set a signal handler to SIG_DFL while setting the SA_SIGINFO flag, because assigning to the *sa_handler* member of **struct sigaction** instead of the *sa_sigaction* member would result in undefined behavior, and SIG_DFL need not be assignment-compatible with *sa_sigaction*. Even if an assignment of SIG_DFL to *sa_sigaction* is accepted by the compiler, the implementation need not treat this value as special—it could just be taken as the address of a signal-catching function.

RATIONALE

Existing programming practice on realtime systems uses the ability to pause waiting for a selected set of events and handle the first event that occurs in-line instead of in a signal-handling function. This allows applications to be written in an event-directed style similar to a state machine. This style of programming is useful for largescale transaction processing in which the overall throughput of an application and the ability to clearly track states are more important than the ability to minimize the response time of individual event handling.

It is possible to construct a signal-waiting macro function out of the realtime signal function mechanism defined in this volume of POSIX.1-2017. However, such a macro has to include the definition of a generalized handler for all signals to be waited on. A significant portion of the overhead of handler processing can be avoided if the signal-waiting function is provided by the kernel. This volume of POSIX.1-2017 therefore provides two signal-waiting functions ‡one that waits indefinitely and one with a timeout ‡as part of the overall realtime signal function specification.

The specification of a function with a timeout allows an application to be written that can be broken out of a wait after a set period of time if no event has occurred. It was argued that setting a timer event before the wait and recognizing the timer event in the wait would also implement the same functionality, but at a lower performance level. Because of the performance degradation associated with the user-level specification of a timer event and the subsequent cancellation of that timer event after the wait completes for a valid event, and the complexity associated with handling potential race conditions associated with the user-level method, the separate function has been included.

Note that the semantics of the *sigwaitinfo*( ) function are nearly identical to that of the *sigwait*( ) function defined by this volume of POSIX.1-2017. The only difference is that *sigwaitinfo*( ) returns the queued signal value in the *value* argument. The return of the queued value is required so that applications can differentiate between multiple events queued to the same signal number.

The two distinct functions are being maintained because some implementations may choose to implement the POSIX Threads Extension functions and not implement the queued signals extensions. Note, though, that *sigwaitinfo*( ) does not return the queued value if the *value* argument is NULL, so the POSIX Threads Extension *sigwait*( ) function can be implemented as a macro on *sigwaitinfo*( ).

The *sigtimedwait*( ) function was separated from the *sigwaitinfo*( ) function to address concerns regarding the overloading of the *timeout* pointer to indicate indefinite wait (no timeout), timed wait, and immediate return, and concerns regarding consistency with other functions where the conditional and timed waits were separate functions from the pure blocking function. The semantics of *sigtimedwait*( ) are specified such that *sigwaitinfo*( ) could be implemented as a macro with a null pointer for *timeout*.

The *sigwait* functions provide a synchronous mechanism for threads to wait for asynchronously-generated signals. One important question was how many threads that are suspended in a call to a *sigwait*( ) function for a signal should return from the call when the signal is sent. Four choices were considered:

1. Return an error for multiple simultaneous calls to *sigwait* functions for the same signal.
2. One or more threads return.
3. All waiting threads return.
4. Exactly one thread returns.

Prohibiting multiple calls to *sigwait*( ) for the same signal was felt to be overly restrictive. The ``one or more'' behavior made implementation of conforming packages easy at the expense of forcing POSIX threads clients to protect against multiple simultaneous calls to *sigwait*( ) in application code in order to achieve predictable behavior. There was concern that the ``all waiting threads'' behavior would result in ``signal broadcast storms'', consuming excessive CPU resources by replicating the signals in the general case. Furthermore, no convincing examples could be presented that delivery to all was either simpler or more powerful than delivery to one.

Thus, the consensus was that exactly one thread that was suspended in a call to a *sigwait* function for a signal should return when that signal occurs. This is not an onerous restriction as:

> A multi-way signal wait can be built from the single-way wait.
>
> Signals should only be handled by application-level code, as library routines cannot guess what the application wants to do with signals generated for the entire process.
>
> Applications can thus arrange for a single thread to wait for any given signal and call any needed routines upon its arrival.

In an application that is using signals for interprocess communication, signal processing is typically done in one place. Alternatively, if the signal is being caught so that process cleanup can be done, the signal handler thread can call separate process cleanup routines for each portion of the application. Since the application main line started each portion of the application, it is at the right abstraction level to tell each portion of the application to clean up.

Certainly, there exist programming styles where it is logical to consider waiting for a single signal in multiple threads. A simple *sigwait_multiple*( ) routine can be constructed to achieve this goal. A possible implementation would be to have each *sigwait_multiple*( ) caller registered as having expressed interest in a set of signals. The caller then waits on a thread-specific condition variable. A single server thread calls a *sigwait*( ) function on the union of all registered signals. When the *sigwait*( ) function returns, the appropriate state is set and condition variables are broadcast. New *sigwait_multiple*( ) callers may cause the pending *sigwait*( ) call to be canceled

and reissued in order to update the set of signals being waited for.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6

These functions are marked as part of the Realtime Signals Extension option.

The Open Group Corrigendum U035/3 is applied. The SYNOPSIS of the *sigwaitinfo*( ) function has been corrected so that the second argument is of type **siginfo_t** *.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Realtime Signals Extension option.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the CLOCK_MONOTONIC clock, if supported, is used to measure timeout intervals.

The **restrict** keyword is added to the *sigtimedwait*( ) and *sigwaitinfo*( ) prototypes for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/130 is applied, restoring wording in the RETURN VALUE section to that in the original base document (``An implementation should only check for this error if no signal is pending in *set* and it is necessary to wait'').

Issue 7

The *sigtimedwait*( ) and *sigwaitinfo*( ) functions are moved from the Realtime Signals Extension option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0583 [392] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0333 [815] is applied.

64071 **NAME**

64072 sigwait ‡'wait for queued signals

64073 **SYNOPSIS**

64074 CX
```
#include <signal.h>

int sigwait(const sigset_t *restrict set, int *restrict sig);
```
64075

64076 **DESCRIPTION**

64077 The *sigwait*( ) function shall select a pending signal from *set*, atomically clear it from the system's
64078 set of pending signals, and return that signal number in the location referenced by *sig*. If prior to
64079 the call to *sigwait*( ) there are multiple pending instances of a single signal number, it is
64080 implementation-defined whether upon successful return there are any remaining pending
64081 signals for that signal number. If the implementation supports queued signals and there are
64082 multiple signals queued for the signal number selected, the first such queued signal shall cause a
64083 return from *sigwait*( ) and the remainder shall remain queued. If no signal in *set* is pending at the
64084 time of the call, the thread shall be suspended until one or more becomes pending. The signals
64085 defined by *set* shall have been blocked at the time of the call to *sigwait*( ); otherwise, the behavior
64086 is undefined. The effect of *sigwait*( ) on the signal actions for the signals in *set* is unspecified.

64087 If more than one thread is using *sigwait*( ) to wait for the same signal, no more than one of these
64088 threads shall return from *sigwait*( ) with the signal number. If more than a single thread is
64089 blocked in *sigwait*( ) for a signal when that signal is generated for the process, it is unspecified
64090 which of the waiting threads returns from *sigwait*( ). If the signal is generated for a specific
64091 thread, as by *pthread_kill*( ), only that thread shall return.

64092 Should any of the multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it
64093 shall be the lowest numbered one. The selection order between realtime and non-realtime
64094 signals, or between multiple pending non-realtime signals, is unspecified.

64095 **RETURN VALUE**

64096 Upon successful completion, *sigwait*( ) shall store the signal number of the received signal at the
64097 location referenced by *sig* and return zero. Otherwise, an error number shall be returned to
64098 indicate the error.

64099 **ERRORS**

64100 The *sigwait*( ) function may fail if:

64101 [EINVAL] The *set* argument contains an invalid or unsupported signal number.

64102 **EXAMPLES**

64103 None.

64104 **APPLICATION USAGE**

64105 None.

64106 **RATIONALE**

64107 To provide a convenient way for a thread to wait for a signal, this volume of POSIX.1-2017
64108 provides the *sigwait*( ) function. For most cases where a thread has to wait for a signal, the
64109 *sigwait*( ) function should be quite convenient, efficient, and adequate.

64110 However, requests were made for a lower-level primitive than *sigwait*( ) and for semaphores that
64111 could be used by threads. After some consideration, threads were allowed to use semaphores
64112 and *sem_post*( ) was defined to be async-signal-safe.

64113 In summary, when it is necessary for code run in response to an asynchronous signal to notify a
64114 thread, *sigwait*( ) should be used to handle the signal. Alternatively, if the implementation
64115 provides semaphores, they also can be used, either following *sigwait*( ) or from within a signal

handling routine previously registered with *sigaction*( ).

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6

The **restrict** keyword is added to the *sigwait*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/131 is applied, updating the DESCRIPTION to state that if more than a single thread is blocked in *sigwait*( ), it is unspecified which of the waiting threads returns, and that if a signal is generated for a specific thread only that thread shall return.

Issue 7

Functionality relating to the Realtime Signals Extension option is moved to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0584 [76] is applied.

NAME

sigwaitinfo ‡'wait for queued signals

SYNOPSIS

```
#include <signal.h>

int sigwaitinfo(const sigset_t *restrict set, siginfo_t *restrict info);
```

DESCRIPTION

Refer to *sigtimedwait( )*.

64143 **NAME**

64144 sin, sinf, sinl ‡'sine function

64145 **SYNOPSIS**

64146
```
#include <math.h>
```

64147
```
double sin(double x);
```
64148
```
float sinf(float x);
```
64149
```
long double sinl(long double x);
```

64150 **DESCRIPTION**

64151 CX The functionality described on this reference page is aligned with the ISO C standard. Any
64152 conflict between the requirements described here and the ISO C standard is unintentional. This
64153 volume of POSIX.1-2017 defers to the ISO C standard.

64154 These functions shall compute the sine of their argument *x*, measured in radians.

64155 An application wishing to check for error situations should set *errno* to zero and call
64156 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
64157 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
64158 zero, an error has occurred.

64159 **RETURN VALUE**

64160 Upon successful completion, these functions shall return the sine of *x*.

64161 MX If *x* is NaN, a NaN shall be returned.

64162 If *x* is ±0, *x* shall be returned.

64163 If *x* is subnormal, a range error may occur
64164 MXX and *x* should be returned.

64165 MX If *x* is not returned, *sin*( ), *sinf*( ), and *sinl*( ) shall return an implementation-defined value no
64166 greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

64167 If *x* is ±Inf, a domain error shall occur, and a NaN shall be returned.

64168 **ERRORS**

64169 These functions shall fail if:

64170 MX Domain Error The *x* argument is ±Inf.

64171 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
64172 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
64173 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
64174 shall be raised.

64175 These functions may fail if:

64176 MX Range Error The value of *x* is subnormal

64177 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
64178 then *errno* shall be set to [ERANGE]. If the integer expression
64179 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
64180 floating-point exception shall be raised.

EXAMPLES

Taking the Sine of a 45-Degree Angle

```
#include <math.h>
...
double radians = 45.0 * M_PI / 180;
double result;
...
result = sin(radians);
```

APPLICATION USAGE

These functions may lose accuracy when their argument is near a multiple of π or is far from 0.0.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes in previous issues.

Issue 6

The *sinf*( ) and *sinl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0585 [68] and XSH/TC1-2008/0586 [320] are applied.

NAME

sinh, sinhf, sinhl ‡'hyperbolic sine functions

SYNOPSIS

```
#include <math.h>

double sinh(double x);
float sinhf(float x);
long double sinhl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall compute the hyperbolic sine of their argument *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the hyperbolic sine of *x*.

If the result would cause an overflow, a range error shall occur and ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (with the same sign as *x*) shall be returned as appropriate for the type of the function.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0 or ±Inf, *x* shall be returned.

If *x* is subnormal, a range error may occur
MXX and *x* should be returned.

MX If *x* is not returned, *sinh*( ), *sinhf*( ), and *sinhl*( ) shall return an implementation-defined value no greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

ERRORS

These functions shall fail if:

Range Error — The result would cause an overflow.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

MX Range Error — The value *x* is subnormal.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

The *sinhf*( ) and *sinhl*( ) functions are added for alignment with the ISO/IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0587 [68] is applied.

64279 **NAME**

64280 sinl ‡′sine function

64281 **SYNOPSIS**

64282 `#include <math.h>`

64283 `long double sinl(long double x);`

64284 **DESCRIPTION**

64285 Refer to *sin( )*.

64286 **NAME**

64287 sleep ‡'suspend execution for an interval of time

64288 **SYNOPSIS**

64289 `#include <unistd.h>`

64290 `unsigned sleep(unsigned seconds);`

64291 **DESCRIPTION**

64292 The *sleep*( ) function shall cause the calling thread to be suspended from execution until either
64293 the number of realtime seconds specified by the argument *seconds* has elapsed or a signal is
64294 delivered to the calling thread and its action is to invoke a signal-catching function or to
64295 terminate the process. The suspension time may be longer than requested due to the scheduling
64296 of other activity by the system.

64297 In single-threaded programs, *sleep*( ) may make use of SIGALRM. In multi-threaded programs,
64298 *sleep*( ) shall not make use of SIGALRM and the remainder of this DESCRIPTION does not apply.

64299 If a SIGALRM signal is generated for the calling process during execution of *sleep*( ) and if the
64300 SIGALRM signal is being ignored or blocked from delivery, it is unspecified whether *sleep*( )
64301 returns when the SIGALRM signal is scheduled. If the signal is being blocked, it is also
64302 unspecified whether it remains pending after *sleep*( ) returns or it is discarded.

64303 If a SIGALRM signal is generated for the calling process during execution of *sleep*( ), except as a
64304 result of a prior call to *alarm*( ), and if the SIGALRM signal is not being ignored or blocked from
64305 delivery, it is unspecified whether that signal has any effect other than causing *sleep*( ) to return.

64306 If a signal-catching function interrupts *sleep*( ) and examines or changes either the time a
64307 SIGALRM is scheduled to be generated, the action associated with the SIGALRM signal, or
64308 whether the SIGALRM signal is blocked from delivery, the results are unspecified.

64309 If a signal-catching function interrupts *sleep*( ) and calls *siglongjmp*( ) or *longjmp*( ) to restore an
64310 environment saved prior to the *sleep*( ) call, the action associated with the SIGALRM signal and
64311 the time at which a SIGALRM signal is scheduled to be generated are unspecified. It is also
64312 unspecified whether the SIGALRM signal is blocked, unless the signal mask of the process is
64313 restored as part of the environment.

64314 XSI Interactions between *sleep*( ) and *setitimer*( ) are unspecified.

64315 **RETURN VALUE**

64316 If *sleep*( ) returns because the requested time has elapsed, the value returned shall be 0. If *sleep*( )
64317 returns due to delivery of a signal, the return value shall be the ``unslept'' amount (the requested
64318 time minus the time actually slept) in seconds.

64319 **ERRORS**

64320 No errors are defined.

64321 **EXAMPLES**

64322 None.

64323 **APPLICATION USAGE**

64324 None.

64325 **RATIONALE**

64326 There are two general approaches to the implementation of the *sleep*( ) function. One is to use the
64327 *alarm*( ) function to schedule a SIGALRM signal and then suspend the calling thread waiting for
64328 that signal. The other is to implement an independent facility. This volume of POSIX.1-2017
64329 permits either approach in single-threaded programs, but the simple alarm/suspend
64330 implementation is not appropriate for multi-threaded programs.

In order to comply with the requirement that no primitive shall change a process attribute unless explicitly described by this volume of POSIX.1-2017, an implementation using SIGALRM must carefully take into account any SIGALRM signal scheduled by previous *alarm*( ) calls, the action previously established for SIGALRM, and whether SIGALRM was blocked. If a SIGALRM has been scheduled before the *sleep*( ) would ordinarily complete, the *sleep*( ) must be shortened to that time and a SIGALRM generated (possibly simulated by direct invocation of the signal-catching function) before *sleep*( ) returns. If a SIGALRM has been scheduled after the *sleep*( ) would ordinarily complete, it must be rescheduled for the same time before *sleep*( ) returns. The action and blocking for SIGALRM must be saved and restored.

Historical implementations often implement the SIGALRM-based version using *alarm*( ) and *pause*( ). One such implementation is prone to infinite hangups, as described in *pause*( ). Another such implementation uses the C-language *setjmp*( ) and *longjmp*( ) functions to avoid that window. That implementation introduces a different problem: when the SIGALRM signal interrupts a signal-catching function installed by the user to catch a different signal, the *longjmp*( ) aborts that signal-catching function. An implementation based on *sigprocmask*( ), *alarm*( ), and *sigsuspend*( ) can avoid these problems.

Despite all reasonable care, there are several very subtle, but detectable and unavoidable, differences between the two types of implementations. These are the cases mentioned in this volume of POSIX.1-2017 where some other activity relating to SIGALRM takes place, and the results are stated to be unspecified. All of these cases are sufficiently unusual as not to be of concern to most applications.

See also the discussion of the term *realtime* in *alarm*( ).

Since *sleep*( ) can be implemented using *alarm*( ), the discussion about alarms occurring early under *alarm*( ) applies to *sleep*( ) as well.

Application developers should note that the type of the argument *seconds* and the return value of *sleep*( ) is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces Application cannot pass a value greater than the minimum guaranteed value for {UINT_MAX}, which the ISO C standard sets as 65 535, and any application passing a larger value is restricting its portability. A different type was considered, but historical implementations, including those with a 16-bit **int** type, consistently use either **unsigned** or **int**.

Scheduling delays may cause the process to return from the *sleep*( ) function significantly after the requested time. In such cases, the return value should be set to zero, since the formula (requested time minus the time actually spent) yields a negative number and *sleep*( ) returns an **unsigned**.

FUTURE DIRECTIONS

A future version of this standard may require that *sleep*( ) does not make use of SIGALRM in all programs, not just multi-threaded programs.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

64375 **Issue 6**

64376 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/132 is applied, making a correction in the
64377 RATIONALE section.

64378 **Issue 7**

64379 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0334 [625] is applied.

64380 **NAME**

64381 snprintf ‡'print formatted output

64382 **SYNOPSIS**

64383 `#include <stdio.h>`

64384 `int snprintf(char *restrict s, size_t n,`

64385 `const char *restrict format, ...);`

64386 **DESCRIPTION**

64387 Refer to *fprintf( )*.

64388 **NAME**

64389 sockatmark ‡'determine whether a socket is at the out-of-band mark

64390 **SYNOPSIS**

64391
```
#include <sys/socket.h>
```

64392
```
int sockatmark(int s);
```

64393 **DESCRIPTION**

64394 The *sockatmark*( ) function shall determine whether the socket specified by the descriptor *s* is at
64395 the out-of-band data mark (see Section 2.10.12, on page 527). If the protocol for the socket
64396 supports out-of-band data by marking the stream with an out-of-band data mark, the
64397 *sockatmark*( ) function shall return 1 when all data preceding the mark has been read and the out-
64398 of-band data mark is the first element in the receive queue. The *sockatmark*( ) function shall not
64399 remove the mark from the stream.

64400 **RETURN VALUE**

64401 Upon successful completion, the *sockatmark*( ) function shall return a value indicating whether
64402 the socket is at an out-of-band data mark. If the protocol has marked the data stream and all data
64403 preceding the mark has been read, the return value shall be 1; if there is no mark, or if data
64404 precedes the mark in the receive queue, the *sockatmark*( ) function shall return 0. Otherwise, it
64405 shall return a value of –1 and set *errno* to indicate the error.

64406 **ERRORS**

64407 The *sockatmark*( ) function shall fail if:

64408 [EBADF] The *s* argument is not a valid file descriptor.

64409 [ENOTTY] The file associated with the *s* argument is not a socket.

64410 **EXAMPLES**

64411 None.

64412 **APPLICATION USAGE**

64413 The use of this function between receive operations allows an application to determine which
64414 received data precedes the out-of-band data and which follows the out-of-band data.

64415 There is an inherent race condition in the use of this function. On an empty receive queue, the
64416 current read of the location might well be at the ``mark'', but the system has no way of knowing
64417 that the next data segment that will arrive from the network will carry the mark, and
64418 *sockatmark*( ) will return false, and the next read operation will silently consume the mark.

64419 Hence, this function can only be used reliably when the application already knows that the out-
64420 of-band data has been seen by the system or that it is known that there is data waiting to be read
64421 at the socket (via SIGURG or *select*( )). See Section 2.10.11 (on page 526), Section 2.10.12 (on page
64422 527), Section 2.10.14 (on page 527), and *pselect*( ) for details.

64423 **RATIONALE**

64424 The *sockatmark*( ) function replaces the historical SIOCATMARK command to *ioctl*( ) which
64425 implemented the same functionality on many implementations. Using a wrapper function
64426 follows the adopted conventions to avoid specifying commands to the *ioctl*( ) function, other
64427 than those now included to support XSI STREAMS. The *sockatmark*( ) function could be
64428 implemented as follows:

64429
```
#include <sys/ioctl.h>
```

64430
```
int sockatmark(int s)
```

64431
```
{
```

64432
```
    int val;
```

```
64433            if (ioctl(s,SIOCATMARK,&val)==-1)
64434                return(-1);
64435            return(val);
64436        }
```

64437 The use of [ENOTTY] to indicate an incorrect descriptor type matches the historical behavior of
64438 SIOCATMARK.

64439 **FUTURE DIRECTIONS**

64440 None.

64441 **SEE ALSO**

64442 Section 2.10.12 (on page 527), *pselect( )*, *recv( )*, *recvmsg( )*

64443 XBD **<sys/socket.h>**

64444 **CHANGE HISTORY**

64445 First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

64446 **Issue 7**

64447 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

64448 **NAME**

64449 socket — create an endpoint for communication

64450 **SYNOPSIS**

64451 `#include <sys/socket.h>`

64452 `int socket(int domain, int type, int protocol);`

64453 **DESCRIPTION**

64454 The *socket*( ) function shall create an unbound socket in a communications domain, and return a
64455 file descriptor that can be used in later function calls that operate on sockets. The file descriptor
64456 shall be allocated as described in Section 2.14 (on page 549).

64457 The *socket*( ) function takes the following arguments:

64458 *domain* Specifies the communications domain in which a socket is to be created.

64459 *type* Specifies the type of socket to be created.

64460 *protocol* Specifies a particular protocol to be used with the socket. Specifying a *protocol*
64461 of 0 causes *socket*( ) to use an unspecified default protocol appropriate for the
64462 requested socket type.

64463 The *domain* argument specifies the address family used in the communications domain. The
64464 address families supported by the system are implementation-defined.

64465 Symbolic constants that can be used for the domain argument are defined in the **<sys/socket.h>**
64466 header.

64467 The *type* argument specifies the socket type, which determines the semantics of communication
64468 over the socket. The following socket types are defined; implementations may specify additional
64469 socket types:

64470 SOCK_STREAM Provides sequenced, reliable, bidirectional, connection-mode byte streams,
64471 and may provide a transmission mechanism for out-of-band data.

64472 SOCK_DGRAM Provides datagrams, which are connectionless-mode, unreliable messages of
64473 fixed maximum length.

64474 SOCK_SEQPACKET
64475 Provides sequenced, reliable, bidirectional, connection-mode transmission
64476 paths for records. A record can be sent using one or more output operations
64477 and received using one or more input operations, but a single operation never
64478 transfers part of more than one record. Record boundaries are visible to the
64479 receiver via the MSG_EOR flag.

64480 If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address
64481 family. If the *protocol* argument is zero, the default protocol for this address family and type shall
64482 be used. The protocols supported by the system are implementation-defined.

64483 The process may need to have appropriate privileges to use the *socket*( ) function or to create
64484 some sockets.

64485 **RETURN VALUE**

64486 Upon successful completion, *socket*( ) shall return a non-negative integer, the socket file
64487 descriptor. Otherwise, a value of –1 shall be returned and *errno* set to indicate the error.

64488 **ERRORS**

64489 The *socket*( ) function shall fail if:

64490 [EAFNOSUPPORT]

64491 The implementation does not support the specified address family.

64492 [EMFILE] All file descriptors available to the process are currently open.

64493 [ENFILE] No more file descriptors are available for the system.

64494 [EPROTONOSUPPORT]

64495 The protocol is not supported by the address family, or the protocol is not
64496 supported by the implementation.

64497 [EPROTOTYPE] The socket type is not supported by the protocol.

64498 The *socket*( ) function may fail if:

64499 [EACCES] The process does not have appropriate privileges.

64500 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

64501 [ENOMEM] Insufficient memory was available to fulfill the request.

64502 **EXAMPLES**

64503 None.

64504 **APPLICATION USAGE**

64505 The documentation for specific address families specifies which protocols each address family
64506 supports. The documentation for specific protocols specifies which socket types each protocol
64507 supports.

64508 The application can determine whether an address family is supported by trying to create a
64509 socket with *domain* set to the protocol in question.

64510 **RATIONALE**

64511 None.

64512 **FUTURE DIRECTIONS**

64513 None.

64514 **SEE ALSO**

64517 XBD **<netinet/in.h>**, **<sys/socket.h>**

64518 **CHANGE HISTORY**

64519 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

64520 **Issue 7**

64521 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0335 [835] is applied.

64522 **NAME**

64523 socketpair — create a pair of connected sockets

64524 **SYNOPSIS**

64525 ```
#include <sys/socket.h>

int socketpair(int domain, int type, int protocol,
    int socket_vector[2]);
```

64528 **DESCRIPTION**

64529 The *socketpair*( ) function shall create an unbound pair of connected sockets in a specified *domain*,
64530 of a specified *type*, under the protocol optionally specified by the *protocol* argument. The two
64531 sockets shall be identical. The file descriptors used in referencing the created sockets shall be
64532 returned in *socket_vector*[0] and *socket_vector*[1]. The file descriptors shall be allocated as
64533 described in Section 2.14 (on page 549).

64534 The *socketpair*( ) function takes the following arguments:

64535 *domain* Specifies the communications domain in which the sockets are to be created.

64536 *type* Specifies the type of sockets to be created.

64537 *protocol* Specifies a particular protocol to be used with the sockets. Specifying a
64538 *protocol* of 0 causes *socketpair*( ) to use an unspecified default protocol
64539 appropriate for the requested socket type.

64540 *socket_vector* Specifies a 2-integer array to hold the file descriptors of the created socket pair.

64541 The *type* argument specifies the socket type, which determines the semantics of communications
64542 over the socket. The following socket types are defined; implementations may specify additional
64543 socket types:

64544 SOCK_STREAM Provides sequenced, reliable, bidirectional, connection-mode byte
64545 streams, and may provide a transmission mechanism for out-of-band
64546 data.

64547 SOCK_DGRAM Provides datagrams, which are connectionless-mode, unreliable messages
64548 of fixed maximum length.

64549 SOCK_SEQPACKET Provides sequenced, reliable, bidirectional, connection-mode transmission
64550 paths for records. A record can be sent using one or more output
64551 operations and received using one or more input operations, but a single
64552 operation never transfers part of more than one record. Record
64553 boundaries are visible to the receiver via the MSG_EOR flag.

64554 If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address
64555 family. If the *protocol* argument is zero, the default protocol for this address family and type shall
64556 be used. The protocols supported by the system are implementation-defined.

64557 The process may need to have appropriate privileges to use the *socketpair*( ) function or to create
64558 some sockets.

64559 **RETURN VALUE**

64560 Upon successful completion, this function shall return 0; otherwise, −1 shall be returned and
64561 *errno* set to indicate the error, no file descriptors shall be allocated, and the contents of
64562 *socket_vector* shall be left unmodified.

  
```

ERRORS

The *socketpair*( ) function shall fail if:

[EAFNOSUPPORT]
: The implementation does not support the specified address family.

[EMFILE]
: All, or all but one, of the file descriptors available to the process are currently open.

[ENFILE]
: No more file descriptors are available for the system.

[EOPNOTSUPP]
: The specified protocol does not permit creation of socket pairs.

[EPROTONOSUPPORT]
: The protocol is not supported by the address family, or the protocol is not supported by the implementation.

[EPROTOTYPE]
: The socket type is not supported by the protocol.

The *socketpair*( ) function may fail if:

[EACCES]
: The process does not have appropriate privileges.

[ENOBUFS]
: Insufficient resources were available in the system to perform the operation.

[ENOMEM]
: Insufficient memory was available to fulfill the request.

EXAMPLES

None.

APPLICATION USAGE

The documentation for specific address families specifies which protocols each address family supports. The documentation for specific protocols specifies which socket types each protocol supports.

The *socketpair*( ) function is used primarily with UNIX domain sockets and need not be supported for other domains.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

Issue 7

The description of the [EMFILE] error condition is aligned with the *pipe*( ) function.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0336 [835] and XSH/TC2-2008/0337 [483,835] are applied.

64600 **NAME**

64601 sprintf ‡′print formatted output

64602 **SYNOPSIS**

64603 `#include <stdio.h>`

64604 `int sprintf(char *restrict s, const char *restrict format, ...);`

64605 **DESCRIPTION**

64606 Refer to *fprintf( )*.

NAME

sqrt, sqrtf, sqrtl ‡square root function

SYNOPSIS

```
#include <math.h>

double sqrt(double x);
float sqrtf(float x);
long double sqrtl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall compute the square root of their argument x, $\sqrt{x}$.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the square root of x.

MX For finite values of $x < -0$, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

MX If x is NaN, a NaN shall be returned.

If x is ±0 or +Inf, x shall be returned.

If x is −Inf, a domain error shall occur, and a NaN shall be returned.

ERRORS

These functions shall fail if:

MX Domain Error The finite value of x is < -0, or x is −Inf.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

Taking the Square Root of 9.0

```
#include <math.h>
...
double x = 9.0;
double result;
...
result = sqrt(x);
```

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

64709 Refer to *fstatvfs( )*.

NAME

stderr, stdin, stdout ‡ standard I/O streams

SYNOPSIS

```
#include <stdio.h>

extern FILE *stderr, *stdin, *stdout;
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

A file with associated buffering is called a *stream* and is declared to be a pointer to a defined type **FILE**. The *fopen*( ) function shall create certain descriptive data for a stream and return a pointer to designate the stream in all further transactions. Normally, there are three open streams with constant pointers declared in the **<stdio.h>** header and associated with the standard open files.

At program start-up, three streams shall be predefined and need not be opened explicitly: *standard input* (for reading conventional input), *standard output* (for writing conventional output), and *standard error* (for writing diagnostic output). When opened, the standard error stream is not fully buffered; the standard input and standard output streams are fully buffered if and only if the stream can be determined not to refer to an interactive device.

CX The following symbolic values in **<unistd.h>** define the file descriptors that shall be associated with the C-language *stdin*, *stdout*, and *stderr* when the application is started:

STDIN_FILENO Standard input value, *stdin*. Its value is 0.

STDOUT_FILENO Standard output value, *stdout*. Its value is 1.

STDERR_FILENO Standard error value, *stderr*. Its value is 2.

The *stderr* stream is expected to be open for reading and writing.

RETURN VALUE

None.

ERRORS

No errors are defined.

NAME

stpcpy — copy a string and return a pointer to the end of the result

SYNOPSIS

CX
```
#include <string.h>

char *stpcpy(char *restrict s1, const char *restrict s2);
```

DESCRIPTION

Refer to *strcpy( )*.

64762 **NAME**

64763 stpncpy — copy fixed length string, returning a pointer to the array end

64764 **SYNOPSIS**

64765 CX
```
#include <string.h>

char *stpncpy(char *restrict s1, const char *restrict s2, size_t size);
```
64766

64767 **DESCRIPTION**

64768 Refer to *strncpy( )*.

NAME

strcasecmp, strcasecmp_l, strncasecmp, strncasecmp_l — case-insensitive string comparisons

SYNOPSIS

```
#include <strings.h>

int strcasecmp(const char *s1, const char *s2);
int strcasecmp_l(const char *s1, const char *s2,
    locale_t locale);
int strncasecmp(const char *s1, const char *s2, size_t n);
int strncasecmp_l(const char *s1, const char *s2,
    size_t n, locale_t locale);
```

DESCRIPTION

The *strcasecmp*( ) and *strcasecmp_l*( ) functions shall compare, while ignoring differences in case, the string pointed to by *s1* to the string pointed to by *s2*. The *strncasecmp*( ) and *strncasecmp_l*( ) functions shall compare, while ignoring differences in case, not more than *n* bytes from the string pointed to by *s1* to the string pointed to by *s2*.

The *strcasecmp*( ) and *strncasecmp*( ) functions use the current locale to determine the case of the characters.

The *strcasecmp_l*( ) and *strncasecmp_l*( ) functions use the locale represented by *locale* to determine the case of the characters.

When the *LC_CTYPE* category of the locale being used is from the POSIX locale, these functions shall behave as if the strings had been converted to lowercase and then a byte comparison performed. Otherwise, the results are unspecified.

The behavior is undefined if the *locale* argument to *strcasecmp_l*( ) or *strncasecmp_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

Upon completion, *strcasecmp*( ) and *strcasecmp_l*( ) shall return an integer greater than, equal to, or less than 0, if the string pointed to by *s1* is, ignoring case, greater than, equal to, or less than the string pointed to by *s2*, respectively.

Upon successful completion, *strncasecmp*( ) and *strncasecmp_l*( ) shall return an integer greater than, equal to, or less than 0, if the possibly null-terminated array pointed to by *s1* is, ignoring case, greater than, equal to, or less than the possibly null-terminated array pointed to by *s2*, respectively.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

64815 First released in Issue 4, Version 2.

64816 **Issue 5**

64817 Moved from X/OPEN UNIX extension to BASE.

64818 **Issue 7**

64819 The *strcasecmp( )* and *strncasecmp( )* functions are moved from the XSI option to the Base.

64820 The *strcasecmp_l( )* and *strncasecmp_l( )* functions are added from The Open Group Technical
64821 Standard, 2006, Extended API Set Part 4.

64822 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0589 [302], XSH/TC1-2008/0590 [294],
64823 XSH/TC1-2008/0591 [283], and XSH/TC1-2008/0592 [283] are applied.

NAME

strcat — concatenate two strings

SYNOPSIS

```
#include <string.h>

char *strcat(char *restrict s1, const char *restrict s2);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *strcat*( ) function shall append a copy of the string pointed to by *s2* (including the terminating NUL character) to the end of the string pointed to by *s1*. The initial byte of *s2* overwrites the NUL character at the end of *s1*. If copying takes place between objects that overlap, the behavior is undefined.

RETURN VALUE

The *strcat*( ) function shall return *s1*; no return value is reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

This version is aligned with the ISO C standard; this does not affect compatibility with XPG3 applications. Reliable error detection by this function was never guaranteed.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

strcmp — compare two strings

SYNOPSIS

```
#include <string.h>

int strcmp(const char *s1, const char *s2);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *strcmp*( ) function shall compare the string pointed to by *s1* to the string pointed to by *s2*.

The sign of a non-zero return value shall be determined by the sign of the difference between the values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings being compared.

RETURN VALUE

Upon completion, *strcmp*( ) shall return an integer greater than, equal to, or less than 0, if the string pointed to by *s1* is greater than, equal to, or less than the string pointed to by *s2*, respectively.

ERRORS

No errors are defined.

EXAMPLES

Checking a Password Entry

The following example compares the information read from standard input to the value of the name of the user entry. If the *strcmp*( ) function returns 0 (indicating a match), a further check will be made to see if the user entered the proper old password. The *crypt*( ) function shall encrypt the old password entered by the user, using the value of the encrypted password in the **passwd** structure as the salt. If this value matches the value of the encrypted **passwd** in the structure, the entered password *oldpasswd* is the correct user's password. Finally, the program encrypts the new password so that it can store the information in the **passwd** structure.

```
#include <string.h>
#include <unistd.h>
#include <stdio.h>
...
int valid_change;
struct passwd *p;
char user[100];
char oldpasswd[100];
char newpasswd[100];
char savepasswd[100];
...
if (strcmp(p->pw_name, user) == 0) {
    if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
        strcpy(savepasswd, crypt(newpasswd, user));
        p->pw_passwd = savepasswd;
        valid_change = 1;
    }
    else {
```

```
                fprintf(stderr, "Old password is not valid\n");
            }
        }
        ...
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

NAME

strcoll, strcoll_l — string comparison using collating information

SYNOPSIS

```
#include <string.h>

int strcoll(const char *s1, const char *s2);
CX int strcoll_l(const char *s1, const char *s2,
        locale_t locale);
```

DESCRIPTION

CX For *strcoll*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

CX The *strcoll*( ) and *strcoll_l*( ) functions shall compare the string pointed to by *s1* to the string pointed to by *s2*, both interpreted as appropriate to the *LC_COLLATE* category of the current CX locale, or of the locale represented by *locale*, respectively.

CX The *strcoll*( ) and *strcoll_l*( ) functions shall not change the setting of *errno* if successful.

Since no return value is reserved to indicate an error, an application wishing to check for error CX situations should set *errno* to 0, then call *strcoll*( ), or *strcoll_l*( ) then check *errno*.

CX The behavior is undefined if the *locale* argument to *strcoll_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

Upon successful completion, *strcoll*( ) shall return an integer greater than, equal to, or less than 0, according to whether the string pointed to by *s1* is greater than, equal to, or less than the string CX pointed to by *s2* when both are interpreted as appropriate to the current locale. On error, *strcoll*( ) may set *errno*, but no return value is reserved to indicate an error.

Upon successful completion, *strcoll_l*( ) shall return an integer greater than, equal to, or less than 0, according to whether the string pointed to by *s1* is greater than, equal to, or less than the string pointed to by *s2* when both are interpreted as appropriate to the locale represented by *locale*. On error, *strcoll_l*( ) may set *errno*, but no return value is reserved to indicate an error.

ERRORS

These functions may fail if:

CX [EINVAL] The *s1* or *s2* arguments contain characters outside the domain of the collating sequence.

EXAMPLES

Comparing Nodes

The following example uses an application-defined function, *node_compare*( ), to compare two nodes based on an alphabetical ordering of the *string* field.

```
#include <string.h>
...
struct node { /* These are stored in the table. */
    char *string;
    int length;
};
...
```

```
int node_compare(const void *node1, const void *node2)
{
    return strcoll(((const struct node *)node1)->string,
        ((const struct node *)node2)->string);
}
...
```

APPLICATION USAGE

The *strxfrm*( ) and *strcmp*( ) functions should be used for sorting large lists.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<string.h>**

CHANGE HISTORY

First released in Issue 3.

Issue 5

The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EINVAL] optional error condition is added.

An example is added.

Issue 7

The *strcoll_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0593 [283] and XSH/TC1-2008/0594 [283] are applied.

65024 **NAME**

65025 stpcpy, strcpy — copy a string and return a pointer to the end of the result

65026 **SYNOPSIS**

65027
```
#include <string.h>
```

65028 CX
```
char *stpcpy(char *restrict s1, const char *restrict s2);
```
65029
```
char *strcpy(char *restrict s1, const char *restrict s2);
```

65030 **DESCRIPTION**

65031 CX For *strcpy*(): The functionality described on this reference page is aligned with the ISO C
65032 standard. Any conflict between the requirements described here and the ISO C standard is
65033 unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

65034 CX The *stpcpy*() and *strcpy*() functions shall copy the string pointed to by *s2* (including the
65035 terminating NUL character) into the array pointed to by *s1*.

65036 If copying takes place between objects that overlap, the behavior is undefined.

65037 **RETURN VALUE**

65038 CX The *stpcpy*() function shall return a pointer to the terminating NUL character copied into the *s1*
65039 buffer.

65040 The *strcpy*() function shall return *s1*.

65041 No return values are reserved to indicate an error.

65042 **ERRORS**

65043 No errors are defined.

65044 **EXAMPLES**

65045 **Construction of a Multi-Part Message in a Single Buffer**

65046
```
#include <string.h>
```
65047
```
#include <stdio.h>
```

65048
```
int
```
65049
```
main (void)
```
65050
```
{
```
65051
```
    char buffer [10];
```
65052
```
    char *name = buffer;
```

65053
```
    name = stpcpy (stpcpy (stpcpy (name, "ice"),"-"), "cream");
```
65054
```
    puts (buffer);
```
65055
```
    return 0;
```
65056
```
}
```

65057 **Initializing a String**

65058 The following example copies the string `"----------"` into the *permstring* variable.

65059
```
#include <string.h>
```
65060
```
...
```
65061
```
static char permstring[11];
```
65062
```
...
```
65063
```
strcpy(permstring, "----------");
```
65064
```
...
```

Storing a Key and Data

The following example allocates space for a key using *malloc*( ) then uses *strcpy*( ) to place the key there. Then it allocates space for data using *malloc*( ), and uses *strcpy*( ) to place data there. (The user-defined function *dbfree*( ) frees memory previously allocated to an array of type **struct element** *.)

```
#include <string.h>
#include <stdlib.h>
#include <stdio.h>
...
/* Structure used to read data and store it. */
struct element {
    char *key;
    char *data;
};

struct element *tbl, *curtbl;
char *key, *data;
int count;
...
void dbfree(struct element *, int);
...
if ((curtbl->key = malloc(strlen(key) + 1)) == NULL) {
    perror("malloc"); dbfree(tbl, count); return NULL;
}
strcpy(curtbl->key, key);

if ((curtbl->data = malloc(strlen(data) + 1)) == NULL) {
    perror("malloc"); free(curtbl->key); dbfree(tbl, count); return NULL;
}
strcpy(curtbl->data, data);
...
```

APPLICATION USAGE

Character movement is performed differently in different implementations. Thus, overlapping moves may yield surprises.

This version is aligned with the ISO C standard; this does not affect compatibility with XPG3 applications. Reliable error detection by this function was never guaranteed.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The *strcpy*( ) prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *stpcpy*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

65113 **NAME**

65114 strcspn — get the length of a complementary substring

65115 **SYNOPSIS**

65116 `#include <string.h>`

65117 `size_t strcspn(const char *s1, const char *s2);`

65118 **DESCRIPTION**

65119 CX The functionality described on this reference page is aligned with the ISO C standard. Any
65120 conflict between the requirements described here and the ISO C standard is unintentional. This
65121 volume of POSIX.1-2017 defers to the ISO C standard.

65122 The *strcspn*( ) function shall compute the length (in bytes) of the maximum initial segment of the
65123 string pointed to by *s1* which consists entirely of bytes *not* from the string pointed to by *s2*.

65124 **RETURN VALUE**

65125 The *strcspn*( ) function shall return the length of the computed segment of the string pointed to
65126 by *s1*; no return value is reserved to indicate an error.

65127 **ERRORS**

65128 No errors are defined.

65129 **EXAMPLES**

65130 None.

65131 **APPLICATION USAGE**

65132 None.

65133 **RATIONALE**

65134 None.

65135 **FUTURE DIRECTIONS**

65136 None.

65137 **SEE ALSO**

65139 XBD **<string.h>**

65140 **CHANGE HISTORY**

65141 First released in Issue 1. Derived from Issue 1 of the SVID.

65142 **Issue 5**

65143 The RETURN VALUE section is updated to indicate that *strcspn*( ) returns the length of *s1*, and
65144 not *s1* itself as was previously stated.

65145 **Issue 6**

65146 The Open Group Corrigendum U030/1 is applied. The text of the RETURN VALUE section is
65147 updated to indicate that the computed segment length is returned, not the *s1* length.

NAME

strdup, strndup — duplicate a specific number of bytes from a string

SYNOPSIS

CX
```
#include <string.h>

char *strdup(const char *s);
char *strndup(const char *s, size_t size);
```

DESCRIPTION

The *strdup*( ) function shall return a pointer to a new string, which is a duplicate of the string pointed to by *s*. The returned pointer can be passed to *free*( ). A null pointer is returned if the new string cannot be created.

The *strndup*( ) function shall be equivalent to the *strdup*( ) function, duplicating the provided *s* in a new block of memory allocated as if by using *malloc*( ), with the exception being that *strndup*( ) copies at most *size* plus one bytes into the newly allocated memory, terminating the new string with a NUL character. If the length of *s* is larger than *size*, only *size* bytes shall be duplicated. If *size* is larger than the length of *s*, all bytes in *s* shall be copied into the new memory buffer, including the terminating NUL character. The newly created string shall always be properly terminated.

RETURN VALUE

The *strdup*( ) function shall return a pointer to a new string on success. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

Upon successful completion, the *strndup*( ) function shall return a pointer to the newly allocated memory containing the duplicated string. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

ERRORS

These functions shall fail if:

[ENOMEM] Storage space available is insufficient.

EXAMPLES

None.

APPLICATION USAGE

For functions that allocate memory as if by *malloc*( ), the application should release such memory when it is no longer required by a call to *free*( ). For *strdup*( ) and *strndup*( ), this is the return value.

Implementations are free to *malloc*( ) a buffer containing either (*size* + 1) bytes or (*strnlen*(*s*, *size*) + 1) bytes. Applications should not assume that *strndup*( ) will allocate (*size* + 1) bytes when *strlen*(*s*) is smaller than *size*.

65190 **CHANGE HISTORY**

65191 First released in Issue 4, Version 2.

65192 **Issue 5**

65193 Moved from X/OPEN UNIX extension to BASE.

65194 **Issue 7**

65195 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the ``may fail'' [ENOMEM]
65196 error to become a ``shall fail'' error.

65197 The *strdup*( ) function is moved from the XSI option to the Base.

65198 The *strndup*( ) function is added from The Open Group Technical Standard, 2006, Extended API
65199 Set Part 1.

65200 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by
65201 *malloc*( ).

65202 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0338 [738] is applied.

65203 **NAME**

65204 strerror, strerror_l, strerror_r — get error message string

65205 **SYNOPSIS**

65206 ```
#include <string.h>
```

65207 ```
char *strerror(int errnum);
```

65208 CX ```
char *strerror_l(int errnum, locale_t locale);
```

65209 ```
int strerror_r(int errnum, char *strerrbuf, size_t buflen);
```

65210 **DESCRIPTION**

65211 CX For *strerror*( ): The functionality described on this reference page is aligned with the ISO C
65212 standard. Any conflict between the requirements described here and the ISO C standard is
65213 unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

65214 The *strerror*( ) function shall map the error number in *errnum* to a locale-dependent error
65215 message string and shall return a pointer to it. Typically, the values for *errnum* come from *errno*,
65216 but *strerror*( ) shall map any value of type **int** to a message.

65217 CX The application shall not modify the string returned. The returned string pointer might be
65218 CX invalidated or the string content might be overwritten by a subsequent call to *strerror*( ), or by a
65219 subsequent call to *strerror_l*( ) in the same thread. The returned pointer and the string content
65220 might also be invalidated if the calling thread is terminated.

65221 CX The string may be overwritten by a subsequent call to *strerror_l*( ) in the same thread.

65222 The contents of the error message strings returned by *strerror*( ) should be determined by the
65223 setting of the *LC_MESSAGES* category in the current locale.

65224 The implementation shall behave as if no function defined in this volume of POSIX.1-2017 calls
65225 *strerror*( ).

65226 CX The *strerror*( ) and *strerror_l*( ) functions shall not change the setting of *errno* if successful.

65227 Since no return value is reserved to indicate an error of *strerror*( ), an application wishing to
65228 check for error situations should set *errno* to 0, then call *strerror*( ), then check *errno*. Similarly,
65229 since *strerror_l*( ) is required to return a string for some errors, an application wishing to check
65230 for all error situations should set *errno* to 0, then call *strerror_l*( ), then check *errno*.

65231 The *strerror*( ) function need not be thread-safe.

65232 The *strerror_l*( ) function shall map the error number in *errnum* to a locale-dependent error
65233 message string in the locale represented by *locale* and shall return a pointer to it.

65234 The *strerror_r*( ) function shall map the error number in *errnum* to a locale-dependent error
65235 message string and shall return the string in the buffer pointed to by *strerrbuf*, with length
65236 *buflen*.

65237 CX If the value of *errnum* is a valid error number, the message string shall indicate what error
65238 occurred; if the value of *errnum* is zero, the message string shall either be an empty string or
65239 indicate that no error occurred; otherwise, if these functions complete successfully, the message
65240 string shall indicate that an unknown error occurred.

65241 CX The behavior is undefined if the *locale* argument to *strerror_l*( ) is the special locale object
65242 LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

Upon completion, whether successful or not, *strerror*( ) shall return a pointer to the generated message string. CX On error *errno* may be set, but no return value is reserved to indicate an error.

Upon successful completion, *strerror_l*( ) shall return a pointer to the generated message string. If *errnum* is not a valid error number, *errno* may be set to [EINVAL], but a pointer to a message string shall still be returned. If any other error occurs, *errno* shall be set to indicate the error and a null pointer shall be returned.

Upon successful completion, *strerror_r*( ) shall return 0. Otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

CX [EINVAL] The value of *errnum* is neither a valid error number nor zero.

The *strerror_r*( ) function may fail if:

CX [ERANGE] Insufficient storage was supplied via *strerrbuf* and *buflen* to contain the generated message string.

EXAMPLES

None.

APPLICATION USAGE

Historically in some implementations, calls to *perror*( ) would overwrite the string that the pointer returned by *strerror*( ) points to. Such implementations did not conform to the ISO C standard; however, application developers should be aware of this behavior if they wish their applications to be portable to such implementations.

RATIONALE

The *strerror_l*( ) function is required to be thread-safe, thereby eliminating the need for an equivalent to the *strerror_r*( ) function.

Earlier versions of this standard did not explicitly require that the error message strings returned by *strerror*( ) and *strerror_r*( ) provide any information about the error. This version of the standard requires a meaningful message for any successful completion.

Since no return value is reserved to indicate a *strerror*( ) error, but all calls (whether successful or not) must return a pointer to a message string, on error *strerror*( ) can return a pointer to an empty string or a pointer to a meaningful string that can be printed.

Note that the [EINVAL] error condition is a may fail error. If an invalid error number is supplied as the value of *errnum*, applications should be prepared to handle any of the following:

1. Error (with no meaningful message): *errno* is set to [EINVAL], the return value is a pointer to an empty string.
2. Successful completion: *errno* is unchanged and the return value points to a string like `"unknown error"` or `"error number xxx"` (where *xxx* is the value of *errnum*).
3. Combination of #1 and #2: *errno* is set to [EINVAL] and the return value points to a string like `"unknown error"` or `"error number xxx"` (where *xxx* is the value of *errnum*). Since applications frequently use the return value of *strerror*( ) as an argument to functions like *fprintf*( ) (without checking the return value) and since applications have no way to parse an error message string to determine whether *errnum* represents a valid error number, implementations are encouraged to implement #3. Similarly, implementations are encouraged to have *strerror_r*( ) return [EINVAL] and put a string

like "unknown error" or "error number xxx" in the buffer pointed to by *strerrbuf* when the value of *errnum* is not a valid error number.

Some applications rely on being able to set *errno* to 0 before calling a function with no reserved value to indicate an error, then call *strerror*(*errno*) afterwards to detect whether an error occurred (because *errno* changed) or to indicate success (because *errno* remained zero). This usage pattern requires that *strerror*(0) succeed with useful results. Previous versions of the standard did not specify the behavior when *errnum* is zero.

FUTURE DIRECTIONS

None.

XBD **<string.h>**

CHANGE HISTORY

First released in Issue 3.

Issue 5

The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

A note indicating that the *strerror*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, the fact that *errno* may be set is added.
- The [EINVAL] optional error condition is added.

The normative text is updated to avoid use of the term ``must'' for application requirements.

The *strerror_r*( ) function is added in response to IEEE PASC Interpretation 1003.1c #39.

The *strerror_r*( ) function is marked as part of the Thread-Safe Functions option.

Issue 7

Austin Group Interpretation 1003.1-2001 #072 is applied, updating the ERRORS section.

Austin Group Interpretation 1003.1-2001 #156 is applied.

Austin Group Interpretation 1003.1-2001 #187 is applied, clarifying the behavior when the generated error message is an empty string.

SD5-XSH-ERN-191 is applied, updating the APPLICATION USAGE section.

The *strerror_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

The *strerror_r*( ) function is moved from the Thread-Safe Functions option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0595 [75], XSH/TC1-2008/0596 [447], XSH/TC1-2008/0597 [382,428], XSH/TC1-2008/0598 [283], XSH/TC1-2008/0599 [382,428], XSH/TC1-2008/0600 [283], and XSH/TC1-2008/0601 [382,428] are applied.

65326 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0339 [656] is applied.

65327 **NAME**

65328 strfmon, strfmon_l ‡'convert monetary value to a string

65329 **SYNOPSIS**

65330 ```
#include <monetary.h>
```

65331 ```
ssize_t strfmon(char *restrict s, size_t maxsize,
```
65332 ```
    const char *restrict format, ...);
```
65333 ```
ssize_t strfmon_l(char *restrict s, size_t maxsize,
```
65334 ```
    locale_t locale, const char *restrict format, ...);
```

65335 **DESCRIPTION**

65336 The *strfmon*( ) function shall place characters into the array pointed to by *s* as controlled by the
65337 string pointed to by *format*. No more than *maxsize* bytes are placed into the array.

65338 The format is a character string, beginning and ending in its initial state, if any, that contains two
65339 types of objects: *plain characters*, which are simply copied to the output stream, and *conversion*
65340 *specifications*, each of which shall result in the fetching of zero or more arguments which are
65341 converted and formatted. The results are undefined if there are insufficient arguments for the
65342 format. If the format is exhausted while arguments remain, the excess arguments are simply
65343 ignored.

65344 The application shall ensure that a conversion specification consists of the following sequence:

65345 A '%' character

65346 Optional flags

65347 Optional field width

65348 Optional left precision

65349 Optional right precision

65350 A required conversion specifier character that determines the conversion to be performed

65351 The *strfmon_l*( ) function shall be equivalent to the *strfmon*( ) function, except that the locale data
65352 used is from the locale represented by *locale*.

65353 **Flags**

65354 One or more of the following optional flags can be specified to control the conversion:

65355 *=f* An '=' followed by a single character *f* which is used as the numeric fill character. In
65356 order to work with precision or width counts, the fill character shall be a single byte
65357 character; if not, the behavior is undefined. The default numeric fill character is the
65358 <space>. This flag does not affect field width filling which always uses the <space>.
65359 This flag is ignored unless a left precision (see below) is specified.

65360 ^ Do not format the currency amount with grouping characters. The default is to insert
65361 the grouping characters if defined for the current locale.

65362 + or ( Specify the style of representing positive and negative currency amounts. Only one of
65363 '+' or '(' may be specified. If '+' is specified, the locale's equivalent of '+' and '−'
65364 are used (for example, in many locales, the empty string if positive and '−' if
65365 negative). If '(' is specified, negative amounts are enclosed within parentheses. If
65366 neither flag is specified, the '+' style is used.

65367 ! Suppress the currency symbol from the output conversion.

  
```

65368 – Specify the alignment. If this flag is present the result of the conversion is left-justified
65369 (padded to the right) rather than right-justified. This flag shall be ignored unless a field
65370 width (see below) is specified.

65371 **Field Width**

65372 *w* A decimal digit string *w* specifying a minimum field width in bytes in which the result
65373 of the conversion is right-justified (or left-justified if the flag `'-'` is specified). The
65374 default is 0.

65375 **Left Precision**

65376 `#`*n* A `'#'` followed by a decimal digit string *n* specifying a maximum number of digits
65377 expected to be formatted to the left of the radix character. This option can be used to
65378 keep the formatted output from multiple calls to the *strfmon*( ) function aligned in the
65379 same columns. It can also be used to fill unused positions with a special character as in
65380 `"$***123.45"`. This option causes an amount to be formatted as if it has the number
65381 of digits specified by *n*. If more than *n* digit positions are required, this conversion
65382 specification is ignored. Digit positions in excess of those actually required are filled
65383 with the numeric fill character (see the *=f* flag above).

65384 If grouping has not been suppressed with the `'^'` flag, and it is defined for the current
65385 locale, grouping separators are inserted before the fill characters (if any) are added.
65386 Grouping separators are not applied to fill characters even if the fill character is a digit.

65387 To ensure alignment, any characters appearing before or after the number in the
65388 formatted output such as currency or sign symbols are padded as necessary with
65389 <space> characters to make their positive and negative formats an equal length.

65390 **Right Precision**

65391 `.`*p* A <period> followed by a decimal digit string *p* specifying the number of digits after
65392 the radix character. If the value of the right precision *p* is 0, no radix character appears.
65393 If a right precision is not included, a default specified by the current locale is used. The
65394 amount being formatted is rounded to the specified number of digits prior to
65395 formatting.

65396 **Conversion Specifier Characters**

65397 The conversion specifier characters and their meanings are:

65398 `i` The **double** argument is formatted according to the locale's international currency
65399 format (for example, in the US: USD 1,234.56). If the argument is ±Inf or NaN, the result
65400 of the conversion is unspecified.

65401 `n` The **double** argument is formatted according to the locale's national currency format
65402 (for example, in the US: $1,234.56). If the argument is ±Inf or NaN, the result of the
65403 conversion is unspecified.

65404 `%` Convert to a `'%'`; no argument is converted. The entire conversion specification shall
65405 be `%%`.

65406 **Locale Information**

65407 The *LC_MONETARY* category of the current locale affects the behavior of this function including
65408 the monetary radix character (which may be different from the numeric radix character affected
65409 by the *LC_NUMERIC* category), the grouping separator, the currency symbols, and formats. The
65410 international currency symbol should be conformant with the ISO 4217: 2001 standard.

65411 If the value of *maxsize* is greater than {SSIZE_MAX}, the result is implementation-defined.

65412 The behavior is undefined if the *locale* argument to *strfmon_l*( ) is the special locale object
65413 LC_GLOBAL_LOCALE or is not a valid locale object handle.

65414 **RETURN VALUE**

65415 If the total number of resulting bytes including the terminating null byte is not more than
65416 *maxsize*, these functions shall return the number of bytes placed into the array pointed to by *s*,
65417 not including the terminating NUL character. Otherwise, –1 shall be returned, the contents of the
65418 array are unspecified, and *errno* shall be set to indicate the error.

65419 **ERRORS**

65420 These functions shall fail if:

65421 [E2BIG] Conversion stopped due to lack of space in the buffer.

65422 **EXAMPLES**

65423 Given a locale for the US and the values 123.45, –123.45, and 3456.781, the following output
65424 might be produced. Square brackets (`"[ ]"`) are used in this example to delimit the output.

65425 `%n`	`[$123.45]`	Default formatting
65426	`[-$123.45]`	
65427	`[$3,456.78]`	
65428 `%11n`	`[    $123.45]`	Right align within an 11-character field
65429	`[   -$123.45]`	
65430	`[  $3,456.78]`	
65431 `%#5n`	`[ $   123.45]`	Aligned columns for values up to 99 999
65432	`[-$   123.45]`	
65433	`[ $ 3,456.78]`	
65434 `%=*#5n`	`[ $***123.45]`	Specify a fill character
65435	`[-$***123.45]`	
65436	`[ $*3,456.78]`	
65437 `%=0#5n`	`[ $000123.45]`	Fill characters do not use grouping
65438	`[-$000123.45]`	even if the fill character is a digit
65439	`[ $03,456.78]`	
65440 `%^#5n`	`[ $  123.45]`	Disable the grouping separator
65441	`[-$  123.45]`	
65442	`[ $ 3456.78]`	
65443 `%^#5.0n`	`[ $  123]`	Round off to whole units
65444	`[-$  123]`	
65445	`[ $ 3457]`	
65446 `%^#5.4n`	`[ $  123.4500]`	Increase the precision
65447	`[-$  123.4500]`	
65448	`[ $ 3456.7810]`	
65449 `%(#5n`	`[ $   123.45 ]`	Use an alternative pos/neg style

```
                  [($   123.45)]
                  [ $ 3,456.78 ]
```

`%!(#5n` `[    123.45 ]` Disable the currency symbol

```
                  [(   123.45)]
                  [  3,456.78 ]
```

`%-14#5.4n` `[ $   123.4500 ]` Left-justify the output

```
                  [-$   123.4500 ]
                  [ $ 3,456.7810 ]
```

`%14#5.4n` `[  $   123.4500]` Corresponding right-justified output

```
                  [ -$   123.4500]
                  [  $ 3,456.7810]
```

See also the EXAMPLES section in *fprintf*( ).

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

Lowercase conversion characters are reserved for future standards use and uppercase for implementation-defined use.

SEE ALSO

fprintf( ), *localeconv*( )

XBD **<monetary.h>**

CHANGE HISTORY

First released in Issue 4.

Issue 5

Moved from ENHANCED I18N to BASE.

The [ENOSYS] error is removed.

Text is added to the DESCRIPTION warning about values of *maxsize* that are greater than {SSIZE_MAX}.

Issue 6

The normative text is updated to avoid use of the term ``must'' for application requirements.

The **restrict** keyword is added to the *strfmon*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

The EXAMPLES section is reworked, clarifying the output format.

Issue 7

SD5-XSH-ERN-29 is applied, updating the examples for `%(#5n` and `%!(#5n`.

SD5-XSH-ERN-233 is applied, changing the definition of the `'+'` or `'('` flags to refer to multiple locales.

The *strfmon*( ) function is moved from the XSI option to the Base.

The *strfmon_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0602 [302], XSH/TC1-2008/0603 [283], and XSH/TC1-2008/0604 [283] are applied.

65493 **NAME**

65494 strftime, strftime_l ‡’convert date and time to a string

65495 **SYNOPSIS**

65496
```
#include <time.h>
```

65497
```
size_t strftime(char *restrict s, size_t maxsize,
    const char *restrict format, const struct tm *restrict timeptr);
```

65499 CX
```
size_t strftime_l(char *restrict s, size_t maxsize,
    const char *restrict format, const struct tm *restrict timeptr,
    locale_t locale);
```

65502 **DESCRIPTION**

65503 CX For *strftime*( ): The functionality described on this reference page is aligned with the ISO C
65504 standard. Any conflict between the requirements described here and the ISO C standard is
65505 unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

65506 The *strftime*( ) function shall place bytes into the array pointed to by *s* as controlled by the string
65507 pointed to by *format*. The format is a character string, beginning and ending in its initial shift
65508 state, if any. The format string consists of zero or more conversion specifications and ordinary
65509 characters.

65510 Each conversion specification is introduced by the '%' character after which the following
65511 appear in sequence:

65512 CX An optional flag:

65513 0 The zero character ('0'), which specifies that the character used as the padding
65514 character is '0',

65515 + The <plus-sign> character ('+'), which specifies that the character used as the
65516 padding character is '0', and that if and only if the field being produced consumes
65517 more than four bytes to represent a year (for %F, %G, or %Y) or more than two bytes to
65518 represent the year divided by 100 (for %C) then a leading <plus-sign> character shall
65519 be included if the year being processed is greater than or equal to zero or a leading
65520 <hyphen-minus> character ('−') shall be included if the year is less than zero.

65521 The default padding character is unspecified.

65522 An optional minimum field width. If the converted value, including any leading '+' or
65523 '−' sign, has fewer bytes than the minimum field width and the padding character is not
65524 the NUL character, the output shall be padded on the left (after any leading '+' or '−'
65525 sign) with the padding character.

65526 An optional E or O modifier.

65527 A terminating conversion specifier character that indicates the type of conversion to be
65528 applied.

65529 CX The results are unspecified if more than one flag character is specified, a flag character is
65530 specified without a minimum field width; a minimum field width is specified without a flag
65531 character; a modifier is specified with a flag or with a minimum field width; or if a minimum
65532 field width is specified for any conversion specifier other than C, F, G, or Y.

65533 All ordinary characters (including the terminating NUL character) are copied unchanged into
65534 the array. If copying takes place between objects that overlap, the behavior is undefined. No
65535 more than maxsize bytes are placed into the array. Each conversion specifier is replaced by
65536 appropriate characters as described in the following list. The appropriate characters are

determined using the *LC_TIME* category of the current locale and by the values of zero or more members of the broken-down time structure pointed to by *timeptr*, as specified in brackets in the description. If any of the specified values are outside the normal range, the characters stored are unspecified.

CX The *strftime_l*( ) function shall be equivalent to the *strftime*( ) function, except that the locale data used is from the locale represented by *locale*.

Local timezone information is used as though *strftime*( ) called *tzset*( ).

The following conversion specifiers shall be supported:

`a` Replaced by the locale's abbreviated weekday name. [*tm_wday*]

`A` Replaced by the locale's full weekday name. [*tm_wday*]

`b` Replaced by the locale's abbreviated month name. [*tm_mon*]

`B` Replaced by the locale's full month name. [*tm_mon*]

`c` Replaced by the locale's appropriate date and time representation. (See the Base Definitions volume of POSIX.1-2017, **<time.h>**.)

`C` Replaced by the year divided by 100 and truncated to an integer, as a decimal number. [*tm_year*]

If a minimum field width is not specified, the number of characters placed into the array pointed to by *s* will be the number of digits in the year divided by 100 or two, CX whichever is greater. If a minimum field width is specified, the number of characters placed into the array pointed to by *s* will be the number of digits in the year divided by 100 or the minimum field width, whichever is greater.

`d` Replaced by the day of the month as a decimal number [01,31]. [*tm_mday*]

`D` Equivalent to `%m/%d/%y`. [*tm_mon*, *tm_mday*, *tm_year*]

`e` Replaced by the day of the month as a decimal number [1,31]; a single digit is preceded by a space. [*tm_mday*]

CX `F` Equivalent to %+4Y-%m-%d if no flag and no minimum field width are specified. [*tm_year*, *tm_mon*, *tm_mday*]

CX If a minimum field width of *x* is specified, the year shall be output as if by the `Y` specifier (described below) with whatever flag was given and a minimum field width of *x*−6. If *x* is less than 6, the behavior shall be as if *x* equalled 6.

If the minimum field width is specified to be 10, and the year is four digits long, then the output string produced will match the ISO 8601:2004 standard subclause 4.1.2.2 complete representation, extended format date representation of a specific day. If a + flag is specified, a minimum field width of *x* is specified, and *x*−7 bytes are sufficient to hold the digits of the year (not including any needed sign character), then the output will match the ISO 8601:2004 standard subclause 4.1.2.4 complete representation, expanded format date representation of a specific day.

`g` Replaced by the last 2 digits of the week-based year (see below) as a decimal number [00,99]. [*tm_year*, *tm_wday*, *tm_yday*]

`G` Replaced by the week-based year (see below) as a decimal number (for example, 1977). [*tm_year*, *tm_wday*, *tm_yday*]

65578 CX If a minimum field width is specified, the number of characters placed into the array
65579 pointed to by *s* will be the number of digits and leading sign characters (if any) in the
65580 year, or the minimum field width, whichever is greater.

65581 `%h` Equivalent to `%b`. [*tm_mon*]

65582 `%H` Replaced by the hour (24-hour clock) as a decimal number [00,23]. [*tm_hour*]

65583 `%I` Replaced by the hour (12-hour clock) as a decimal number [01,12]. [*tm_hour*]

65584 `%j` Replaced by the day of the year as a decimal number [001,366]. [*tm_yday*]

65585 `%m` Replaced by the month as a decimal number [01,12]. [*tm_mon*]

65586 `%M` Replaced by the minute as a decimal number [00,59]. [*tm_min*]

65587 `%n` Replaced by a <newline>.

65588 `%p` Replaced by the locale's equivalent of either a.m. or p.m. [*tm_hour*]

65589 CX `%r` Replaced by the time in a.m. and p.m. notation; in the POSIX locale this shall be
65590 equivalent to `%I:%M:%S %p`. [*tm_hour*, *tm_min*, *tm_sec*]

65591 `%R` Replaced by the time in 24-hour notation (`%H:%M`). [*tm_hour*, *tm_min*]

65592 `%S` Replaced by the second as a decimal number [00,60]. [*tm_sec*]

65593 `%t` Replaced by a <tab>.

65594 `%T` Replaced by the time (`%H:%M:%S`). [*tm_hour*, *tm_min*, *tm_sec*]

65595 `%u` Replaced by the weekday as a decimal number [1,7], with 1 representing Monday.
65596 [*tm_wday*]

65597 `%U` Replaced by the week number of the year as a decimal number [00,53]. The first
65598 Sunday of January is the first day of week 1; days in the new year before this are in
65599 week 0. [*tm_year*, *tm_wday*, *tm_yday*]

65600 `%V` Replaced by the week number of the year (Monday as the first day of the week) as a
65601 decimal number [01,53]. If the week containing 1 January has four or more days in the
65602 new year, then it is considered week 1. Otherwise, it is the last week of the previous
65603 year, and the next week is week 1. Both January 4th and the first Thursday of January
65604 are always in week 1. [*tm_year*, *tm_wday*, *tm_yday*]

65605 `%w` Replaced by the weekday as a decimal number [0,6], with 0 representing Sunday.
65606 [*tm_wday*]

65607 `%W` Replaced by the week number of the year as a decimal number [00,53]. The first
65608 Monday of January is the first day of week 1; days in the new year before this are in
65609 week 0. [*tm_year*, *tm_wday*, *tm_yday*]

65610 `%x` Replaced by the locale's appropriate date representation. (See the Base Definitions
65611 volume of POSIX.1-2017, **<time.h>**.)

65612 `%X` Replaced by the locale's appropriate time representation. (See the Base Definitions
65613 volume of POSIX.1-2017, **<time.h>**.)

65614 `%y` Replaced by the last two digits of the year as a decimal number [00,99]. [*tm_year*]

65615 `%Y` Replaced by the year as a decimal number (for example, 1997). [*tm_year*]

65616 CX If a minimum field width is specified, the number of characters placed into the array
65617 pointed to by *s* will be the number of digits and leading sign characters (if any) in the

year, or the minimum field width, whichever is greater.

`z` Replaced by the offset from UTC in the ISO 8601:2004 standard format (`+hhmm` or `−hhmm`), or by no characters if no timezone is determinable. For example, `"−0430"` means 4 hours 30 minutes behind UTC (west of Greenwich). If *tm_isdst* is zero, the standard time offset is used. If *tm_isdst* is greater than zero, the daylight savings time offset is used. If *tm_isdst* is negative, no characters are returned. [*tm_isdst*]

`Z` Replaced by the timezone name or abbreviation, or by no bytes if no timezone information exists. [*tm_isdst*]

`%` Replaced by `%`.

If a conversion specification does not correspond to any of the above, the behavior is undefined.

If a **struct tm** broken-down time structure is created by *localtime*( ) or *localtime_r*( ), or modified by *mktime*( ), and the value of *TZ* is subsequently modified, the results of the `%Z` and `%z` *strftime*( ) conversion specifiers are undefined, when *strftime*( ) is called with such a broken-down time structure.

If a **struct tm** broken-down time structure is created or modified by *gmtime*( ) or *gmtime_r*( ), it is unspecified whether the result of the `%Z` and `%z` conversion specifiers shall refer to UTC or the current local timezone, when *strftime*( ) is called with such a broken-down time structure.

Modified Conversion Specifiers

Some conversion specifiers can be modified by the `E` or `O` modifier characters to indicate that an alternative format or specification should be used rather than the one normally used by the unmodified conversion specifier. If the alternative format or specification does not exist for the current locale (see ERA in XBD Section 7.3.5, on page 159), the behavior shall be as if the unmodified conversion specification were used.

`%Ec` Replaced by the locale's alternative appropriate date and time representation.

`%EC` Replaced by the name of the base year (period) in the locale's alternative representation.

`%Ex` Replaced by the locale's alternative date representation.

`%EX` Replaced by the locale's alternative time representation.

`%Ey` Replaced by the offset from `%EC` (year only) in the locale's alternative representation.

`%EY` Replaced by the full alternative year representation.

`%Od` Replaced by the day of the month, using the locale's alternative numeric symbols, filled as needed with leading zeros if there is any alternative symbol for zero; otherwise, with leading <space> characters.

`%Oe` Replaced by the day of the month, using the locale's alternative numeric symbols, filled as needed with leading <space> characters.

`%OH` Replaced by the hour (24-hour clock) using the locale's alternative numeric symbols.

`%OI` Replaced by the hour (12-hour clock) using the locale's alternative numeric symbols.

`%Om` Replaced by the month using the locale's alternative numeric symbols.

`%OM` Replaced by the minutes using the locale's alternative numeric symbols.

65657 `%OS` Replaced by the seconds using the locale's alternative numeric symbols.

65658 `%Ou` Replaced by the weekday as a number in the locale's alternative representation
65659 (Monday=1).

65660 `%OU` Replaced by the week number of the year (Sunday as the first day of the week, rules
65661 corresponding to `%U`) using the locale's alternative numeric symbols.

65662 `%OV` Replaced by the week number of the year (Monday as the first day of the week, rules
65663 corresponding to `%V`) using the locale's alternative numeric symbols.

65664 `%Ow` Replaced by the number of the weekday (Sunday=0) using the locale's alternative
65665 numeric symbols.

65666 `%OW` Replaced by the week number of the year (Monday as the first day of the week) using
65667 the locale's alternative numeric symbols.

65668 `%Oy` Replaced by the year (offset from `%C`) using the locale's alternative numeric symbols.

65669 `%g`, `%G`, and `%V` give values according to the ISO 8601:2004 standard week-based year. In this
65670 system, weeks begin on a Monday and week 1 of the year is the week that includes January 4th,
65671 which is also the week that includes the first Thursday of the year, and is also the first week that
65672 contains at least four days in the year. If the first Monday of January is the 2nd, 3rd, or 4th, the
65673 preceding days are part of the last week of the preceding year; thus, for Saturday 2nd January
65674 1999, `%G` is replaced by 1998 and `%V` is replaced by 53. If December 29th, 30th, or 31st is a
65675 Monday, it and any following days are part of week 1 of the following year. Thus, for Tuesday
65676 30th December 1997, `%G` is replaced by 1998 and `%V` is replaced by 01.

65677 If a conversion specifier is not one of the above, the behavior is undefined.

65678 CX The behavior is undefined if the *locale* argument to *strftime_l*( ) is the special locale object
65679 LC_GLOBAL_LOCALE or is not a valid locale object handle.

65680 **RETURN VALUE**

65681 If the total number of resulting bytes including the terminating null byte is not more than
65682 *maxsize*, these functions shall return the number of bytes placed into the array pointed to by *s*,
65683 not including the terminating NUL character. Otherwise, 0 shall be returned and the contents of
65684 the array are unspecified.

65685 **ERRORS**

65686 No errors are defined.

65687 **EXAMPLES**

65688 **Getting a Localized Date String**

65689 The following example first sets the locale to the user's default. The locale information will be
65690 used in the *nl_langinfo*( ) and *strftime*( ) functions. The *nl_langinfo*( ) function returns the localized
65691 date string which specifies how the date is laid out. The *strftime*( ) function takes this
65692 information and, using the **tm** structure for values, places the date and time information into
65693 *datestring*.

```
65694 #include <time.h>
65695 #include <locale.h>
65696 #include <langinfo.h>
65697 ...
65698 struct tm *tm;
65699 char datestring[256];
65700 ...
```

```
setlocale (LC_ALL, "");
...
strftime (datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
...
```

APPLICATION USAGE

The range of values for `%S` is [00,60] rather than [00,59] to allow for the occasional leap second.

Some of the conversion specifications are duplicates of others. They are included for compatibility with *nl_cxtime*( ) and *nl_ascxtime*( ), which were published in Issue 2.

The `%C`, `%F`, `%G`, and `%Y` format specifiers in *strftime*( ) always print full values, but the *strptime*( ) `%C`, `%F`, and `%Y` format specifiers only scan two digits (assumed to be the first two digits of a four-digit year) for `%C` and four digits (assumed to be the entire (four-digit) year) for `%F` and `%Y`. This mimics the behavior of *printf*( ) and *scanf*( ); that is:

```
printf("%2d", x = 1000);
```

prints `"1000"`, but:

```
scanf(%2d", &x);
```

when given `"1000"` as input will only store 10 in *x*). Applications using extended ranges of years must be sure that the number of digits specified for scanning years with *strptime*( ) matches the number of digits that will actually be present in the input stream. Historic implementations of the `%Y` conversion specification (with no flags and no minimum field width) produced different output formats. Some always produced at least four digits (with 0 fill for years from 0 through 999) while others only produced the number of digits present in the year (with no fill and no padding). These two forms can be produced with the `'0'` flag and a minimum field width options using the conversions specifications `%04Y` and `%01Y`, respectively.

In the past, the C and POSIX standards specified that `%F` produced an ISO 8601:2004 standard date format, but didn't specify which one. For years in the range [0001,9999], POSIX.1-2017 requires that the output produced match the ISO 8601:2004 standard complete representation extended format (YYYY-MM-DD) and for years outside of this range produce output that matches the ISO 8601:2004 standard expanded representation extended format (<+/-><Underline>Y</Underline>YYYY-MM-DD). To fully meet ISO 8601:2004 standard requirements, the producer and consumer must agree on a date format that has a specific number of bytes reserved to hold the characters used to represent the years that is sufficiently large to hold all values that will be shared. For example, the `%+13F` conversion specification will produce output matching the format `"<+/->YYYYYY-MM-DD"` (a leading `'+'` or `'−'` sign; a six-digit, 0-filled year; a `'−'`; a two-digit, leading 0-filled month; another `'−'`; and the two-digit, leading 0-filled day within the month).

Note that if the year being printed is greater than 9999, the resulting string from the unadorned `%F` conversion specifications will not conform to the ISO 8601:2004 standard extended format, complete representation for a date and will instead be an extended format, expanded representation (presumably without the required agreement between the date's producer and consumer).

In the C or POSIX locale, the `E` and `O` modifiers are ignored and the replacement strings for the following specifiers are:

`%a` The first three characters of `%A`.

`%A` One of Sunday, Monday, ..., Saturday.

65745 `%b` The first three characters of `%B`.

65746 `%B` One of January, February, . . ., December.

65747 `%c` Equivalent to `%a %b %e %T %Y`.

65748 `%p` One of AM or PM.

65749 `%r` Equivalent to `%I:%M:%S %p`.

65750 `%x` Equivalent to `%m/%d/%y`.

65751 `%X` Equivalent to `%T`.

65752 `%Z` Implementation-defined.

65753 **RATIONALE**

65754 The `%Y` conversion specification to *strftime*( ) was frequently assumed to be a four-digit year, but
65755 the ISO C standard does not specify that `%Y` is restricted to any subset of allowed values from the
65756 *tm_year* field. Similarly, the `%C` conversion specification was assumed to be a two-digit field and
65757 the first part of the output from the `%F` conversion specification was assumed to be a four-digit
65758 field. With *tm_year* being a signed 32 or more-bit **int** and with many current implementations
65759 supporting 64-bit **time_t** types in one or more programming environments, these assumptions
65760 are clearly wrong.

65761 POSIX.1-2017 now allows the format specifications `%0xC`, `%0xF`, `%0xG`, and `%0xY` (where `'x'` is
65762 a string of decimal digits used to specify printing and scanning of a string of *x* decimal digits)
65763 with leading zero fill characters. Allowing applications to set the field width enables them to
65764 agree on the number of digits to be printed and scanned in the ISO 8601:2004 standard
65765 expanded representation of a year (for `%F`, `%G`, and `%Y`) or all but the last two digits of the year
65766 (for `%C`). This is based on a feature in some versions of GNU **libc**'s *strftime*( ). The GNU version
65767 allows specifying space, zero, or no-fill characters in *strftime*( ) format strings, but does not allow
65768 any flags to be specified in *strptime*( ) format strings. These implementations also allow these
65769 flags to be specified for any numeric field. POSIX.1-2017 only requires the zero fill flag (`'0'`) and
65770 only requires that it be recognized when processing `%C`, `%F`, `%G`, and `%Y` specifications when a
65771 minimum field width is also specified. The `'0'` flag is the only flag needed to produce and scan
65772 the ISO 8601:2004 standard year fields using the extended format forms. POSIX.1-2017 also
65773 allows applications to specify the same flag and field width specifiers to be used in both
65774 *strftime*( ) and *strptime*( ) format strings for symmetry. Systems may provide other flag characters
65775 and may accept flags in conjunction with conversion specifiers other than `%C`, `%F`, `%G`, and `%Y`;
65776 but portable applications cannot depend on such extensions.

65777 POSIX.1-2017 now also allows the format specifications `%+xC`, `%+xF`, `%+xG`, and `%+xY` (where
65778 `'x'` is a string of decimal digits used to specify printing and scanning of a string of `'x'` decimal
65779 digits) with leading zero fill characters and a leading `'+'` sign character if the year being
65780 converted is more than four digits or a minimum field width is specified that allows room for
65781 more than four digits for the year. This allows date providers and consumers to agree on a
65782 specific number of digits to represent a year as required by the ISO 8601:2004 standard
65783 expanded representation formats. The expanded representation formats all require the year to
65784 begin with a leading `'+'` or `'−'` sign. (All of these specifiers can also provide a leading `'−'`
65785 sign for negative years. Since negative years and the year 0 don't fit well with the Gregorian or
65786 Julian calendars, the normal ranges of dates start with year 1. The ISO C standard allows *tm_year*
65787 to assume values corresponding to years before year 1, but the use of such years provided
65788 unspecified results.)

65789 Some earlier version of this standard specified that applications wanting to use *strptime*( ) to scan
65790 dates and times printed by *strftime*( ) should provide non-digit characters between fields to

separate years from months and days. It also supported %F to print and scan the ISO 8601:2004 standard extended format, complete representation date for years 1 through 9999 (i.e., YYYY-MM-DD). However, many applications were written to print (using *strftime*( )) and scan (using *strptime*( )) dates written using the basic format complete representation (four-digit years) and truncated representation (two-digit years) specified by the ISO 8601:2004 standard representation of dates and times which do not have any separation characters between fields. The ISO 8601:2004 standard also specifies basic format expanded representation where the creator and consumer of these fields agree beforehand to represent years as leading zero-filled strings of an agreed length of more than four digits to represent a year (again with no separation characters when year, month, and day are all displayed). Applications producing and consuming expanded representations are encouraged to use the '+' flag and an appropriate maximum field width to scan the year including the leading sign. Note that even without the '+' flag, years less than zero may be represented with a leading <hyphen-minus> for %F, %G, and %Y conversion specifications. Using negative years results in unspecified behavior.

If a format specification %+*x*F with the field width *x* greater than 11 is specified and the width is large enough to display the full year, the output string produced will match the ISO 8601:2004 standard subclause 4.1.2.4 expanded representation, extended format date representation for a specific day. (For years in the range [1,99 999], %+12F is sufficient for an agreed five-digit year with a leading sign using the ISO 8601:2004 standard expanded representation, extended format for a specific day "<+/->YYYYY-MM-DD".) Note also that years less than 0 may produce a leading <hyphen-minus> character ('-') when using %Y or %C whether or not the '0' or '+' flags are used.

The difference between the '0' flag and the '+' flag is whether the leading '+' character will be provided for years >9999 as required for the ISO 8601:2004 standard extended representation format containing a year. For example:

Year	Conversion Specification	*strftime*() Output	*strptime*() Scan Back
1970	%Y	1970	1970
1970	%+4Y	1970	1970
27	%Y	27 or 0027	27
270	%Y	270 or 0270	270
270	%+4Y	0270	270
17	%C%y	0017	17
270	%C%y	0270	270
12345	%Y	12345	1234*
12345	%+4Y	+12345	123*
12345	%05Y	12345	12345
270	%+5Y or %+3C%y	+0270	270
12345	%+5Y or %+3C%y	+12345	1234*
12345	%06Y or %04C%y	012345	12345
12345	%+6Y or %+4C%y	+12345	12345
123456	%08Y or %06C%y	00123456	123456
123456	%+8Y or %+6C%y	+0123456	123456

In the cases above marked with a * in the *strptime*( ) scan back field, the implied or specified number of characters scanned by *strptime*( ) was less than the number of characters output by *strftime*( ) using the same format; so the remaining digits of the year were dropped when the output date produced by *strftime*( ) was scanned back in by *strptime*( ).

FUTURE DIRECTIONS

None.

XBD Section 7.3.5 (on page 159), **<time.h>**

CHANGE HISTORY

First released in Issue 3.

Issue 5

The description of `%OV` is changed to be consistent with `%V` and defines Monday as the first day of the week.

The description of `%Oy` is clarified.

Issue 6

Extensions beyond the ISO C standard are marked.

The Open Group Corrigendum U033/8 is applied. The `%V` conversion specifier is changed from ``Otherwise, it is week 53 of the previous year, and the next week is week 1'' to ``Otherwise, it is the last week of the previous year, and the next week is week 1''.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The `%C`, `%D`, `%e`, `%h`, `%n`, `%r`, `%R`, `%t`, and `%T` conversion specifiers are added.
- The modified conversion specifiers are added for consistency with the ISO POSIX-2 standard *date* utility.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The *strftime*( ) prototype is updated.
- The DESCRIPTION is extensively revised.
- The `%z` conversion specifier is added.

An example is added.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/60 is applied.

Issue 7

Austin Group Interpretation 1003.1-2001 #163 is applied.

The *strftime_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0605 [283], XSH/TC1-2008/0606 [283], XSH/TC1-2008/0607 [193], and XSH/TC1-2008/0608 [193] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0340 [584], XSH/TC2-2008/0341 [796], XSH/TC2-2008/0342 [584], and XSH/TC2-2008/0343 [584] are applied.

65874 **NAME**

65875 strlen, strnlen ‡'get length of fixed size string

65876 **SYNOPSIS**

65877
```
#include <string.h>
```

65878
```
size_t strlen(const char *s);
```

65879 CX
```
size_t strnlen(const char *s, size_t maxlen);
```

65880 **DESCRIPTION**

65881 CX For *strlen*( ): The functionality described on this reference page is aligned with the ISO C
65882 standard. Any conflict between the requirements described here and the ISO C standard is
65883 unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

65884 The *strlen*( ) function shall compute the number of bytes in the string to which *s* points, not
65885 including the terminating NUL character.

65886 CX The *strnlen*( ) function shall compute the smaller of the number of bytes in the array to which *s*
65887 points, not including any terminating NUL character, or the value of the *maxlen* argument. The
65888 *strnlen*( ) function shall never examine more than *maxlen* bytes of the array pointed to by *s*.

65889 **RETURN VALUE**

65890 The *strlen*( ) function shall return the length of *s*; no return value shall be reserved to indicate an
65891 error.

65892 CX The *strnlen*( ) function shall return the number of bytes preceding the first null byte in the array
65893 to which *s* points, if *s* contains a null byte within the first *maxlen* bytes; otherwise, it shall return
65894 *maxlen*.

65895 **ERRORS**

65896 No errors are defined.

65897 **EXAMPLES**

65898 **Getting String Lengths**

65899 The following example sets the maximum length of *key* and *data* by using *strlen*( ) to get the
65900 lengths of those strings.

65901
```
#include <string.h>
...
struct element {
    char *key;
    char *data;
};
...
char *key, *data;
int len;
```

65910
```
*keylength = *datalength = 0;
...
if ((len = strlen(key)) > *keylength)
    *keylength = len;
if ((len = strlen(data)) > *datalength)
    *datalength = len;
...
```

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The RETURN VALUE section is updated to indicate that *strlen*( ) returns the length of *s*, and not *s* itself as was previously stated.

Issue 7

The *strnlen*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0344 [560] is applied.

65935 **NAME**

65936 strncasecmp, strncasecmp_l ‡’case-insensitive string comparisons

65937 **SYNOPSIS**

65938 ```
#include <strings.h>
```

65939 ```
int strncasecmp(const char *s1, const char *s2, size_t n);
```
65940 ```
int strncasecmp_l(const char *s1, const char *s2,
```
65941 ```
    size_t n, locale_t locale);
```

65942 **DESCRIPTION**

65943 Refer to *strcasecmp*( ).

65944 **NAME**

65945 strncat ‡'concatenate a string with part of another

65946 **SYNOPSIS**

65947 `#include <string.h>`

65948 `char *strncat(char *restrict s1, const char *restrict s2, size_t n);`

65949 **DESCRIPTION**

65950 CX The functionality described on this reference page is aligned with the ISO C standard. Any
65951 conflict between the requirements described here and the ISO C standard is unintentional. This
65952 volume of POSIX.1-2017 defers to the ISO C standard.

65953 The *strncat*( ) function shall append not more than *n* bytes (a NUL character and bytes that
65954 follow it are not appended) from the array pointed to by *s2* to the end of the string pointed to by
65955 *s1*. The initial byte of *s2* overwrites the NUL character at the end of *s1*. A terminating NUL
65956 character is always appended to the result. If copying takes place between objects that overlap,
65957 the behavior is undefined.

65958 **RETURN VALUE**

65959 The *strncat*( ) function shall return *s1*; no return value shall be reserved to indicate an error.

65960 **ERRORS**

65961 No errors are defined.

65962 **EXAMPLES**

65963 None.

65964 **APPLICATION USAGE**

65965 None.

65966 **RATIONALE**

65967 None.

65968 **FUTURE DIRECTIONS**

65969 None.

65970 **SEE ALSO**

65971 *strcat*( )

65972 XBD **<string.h>**

65973 **CHANGE HISTORY**

65974 First released in Issue 1. Derived from Issue 1 of the SVID.

65975 **Issue 6**

65976 The *strncat*( ) prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

NAME

strncmp ‡'compare part of two strings

SYNOPSIS

```
#include <string.h>

int strncmp(const char *s1, const char *s2, size_t n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *strncmp*( ) function shall compare not more than *n* bytes (bytes that follow a NUL character are not compared) from the array pointed to by *s1* to the array pointed to by *s2*.

The sign of a non-zero return value is determined by the sign of the difference between the values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings being compared.

RETURN VALUE

Upon successful completion, *strncmp*( ) shall return an integer greater than, equal to, or less than 0, if the possibly null-terminated array pointed to by *s1* is greater than, equal to, or less than the possibly null-terminated array pointed to by *s2* respectively.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

66012 **NAME**

66013 stpncpy, strncpy — copy fixed length string, returning a pointer to the array end

66014 **SYNOPSIS**

66015
```
#include <string.h>
```

66016 CX
```
char *stpncpy(char *restrict s1, const char *restrict s2, size_t n);
```
66017
```
char *strncpy(char *restrict s1, const char *restrict s2, size_t n);
```

66018 **DESCRIPTION**

66019 CX For *strncpy*( ): The functionality described on this reference page is aligned with the ISO C
66020 standard. Any conflict between the requirements described here and the ISO C standard is
66021 unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

66022 CX The *stpncpy*( ) and *strncpy*( ) functions shall copy not more than *n* bytes (bytes that follow a NUL
66023 character are not copied) from the array pointed to by *s2* to the array pointed to by *s1*.

66024 If the array pointed to by *s2* is a string that is shorter than *n* bytes, NUL characters shall be
66025 appended to the copy in the array pointed to by *s1*, until *n* bytes in all are written.

66026 If copying takes place between objects that overlap, the behavior is undefined.

66027 **RETURN VALUE**

66028 CX If a NUL character is written to the destination, the *stpncpy*( ) function shall return the address of
66029 the first such NUL character. Otherwise, it shall return *&s1*[*n*].

66030 The *strncpy*( ) function shall return *s1*.

66031 No return values are reserved to indicate an error.

66032 **ERRORS**

66033 No errors are defined.

66034 **EXAMPLES**

66035 None.

66036 **APPLICATION USAGE**

66037 Applications must provide the space in *s1* for the *n* bytes to be transferred, as well as ensure that
66038 the *s2* and *s1* arrays do not overlap.

66039 Character movement is performed differently in different implementations. Thus, overlapping
66040 moves may yield surprises.

66041 If there is no NUL character byte in the first *n* bytes of the array pointed to by *s2*, the result is not
66042 null-terminated.

66043 **RATIONALE**

66044 None.

66045 **FUTURE DIRECTIONS**

66046 None.

Issue 6

The *strncpy*( ) prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *stpncpy*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

66057 **NAME**

66058 strndup — duplicate a specific number of bytes from a string

66059 **SYNOPSIS**

66060 CX
```
#include <string.h>
```
66061
```
char *strndup(const char *s, size_t size);
```

66062 **DESCRIPTION**

66063 Refer to *strdup( )*.

66064 **NAME**

66065 strnlen ‡'get length of fixed size string

66066 **SYNOPSIS**

66067 CX
```
#include <string.h>

size_t strnlen(const char *s, size_t maxlen);
```

66069 **DESCRIPTION**

66070 Refer to *strlen( )*.

66071 **NAME**

66072 strpbrk ‡'scan a string for a byte

66073 **SYNOPSIS**

66074 `#include <string.h>`

66075 `char *strpbrk(const char *s1, const char *s2);`

66076 **DESCRIPTION**

66077 CX The functionality described on this reference page is aligned with the ISO C standard. Any
66078 conflict between the requirements described here and the ISO C standard is unintentional. This
66079 volume of POSIX.1-2017 defers to the ISO C standard.

66080 The *strpbrk*( ) function shall locate the first occurrence in the string pointed to by *s1* of any byte
66081 from the string pointed to by *s2*.

66082 **RETURN VALUE**

66083 Upon successful completion, *strpbrk*( ) shall return a pointer to the byte or a null pointer if no
66084 byte from *s2* occurs in *s1*.

66085 **ERRORS**

66086 No errors are defined.

66087 **EXAMPLES**

66088 None.

66089 **APPLICATION USAGE**

NAME

strptime ‡'date and time conversion

SYNOPSIS

XSI
```
#include <time.h>

char *strptime(const char *restrict buf, const char *restrict format,
    struct tm *restrict tm);
```

DESCRIPTION

The *strptime*( ) function shall convert the character string pointed to by *buf* to values which are stored in the **tm** structure pointed to by *tm*, using the format specified by *format*.

The format is composed of zero or more directives. Each directive is composed of one of the following: one or more white-space characters (as specified by *isspace*( )); an ordinary character (neither '%' nor a white-space character); or a conversion specification.

Each conversion specification is introduced by the '%' character after which the following appear in sequence:

An optional flag, the zero character ('0') or the <plus-sign> character ('+'), which is ignored.

An optional field width. If a field width is specified, it shall be interpreted as a string of decimal digits that will determine the maximum number of bytes converted for the conversion rather than the number of bytes specified below in the description of the conversion specifiers.

An optional E or O modifier.

A terminating conversion specifier character that indicates the type of conversion to be applied.

The conversions are determined using the *LC_TIME* category of the current locale. The application shall ensure that there is white-space or other non-alphanumeric characters between any two conversion specifications unless all of the adjacent conversion specifications convert a known, fixed number of characters. In the following list, the maximum number of characters scanned (excluding the one matching the next directive) is as follows:

If a maximum field width is specified, then that number

Otherwise, the pattern "{x}" indicates that the maximum is *x*

Otherwise, the pattern "[x,y]" indicates that the value shall fall within the range given (both bounds being inclusive), and the maximum number of characters scanned shall be the maximum required to represent any value in the range without leading zeros and without a leading <plus-sign>

The following conversion specifiers are supported.

The results are unspecified if a modifier is specified with a flag or with a minimum field width, or if a field width is specified for any conversion specifier other than C or Y.

a The day of the week, using the locale's weekday names; either the abbreviated or full name may be specified.

A Equivalent to %a.

66140 `b` The month, using the locale's month names; either the abbreviated or full name may be
66141 specified.

66142 `B` Equivalent to `%b`.

66143 `c` Replaced by the locale's appropriate date and time representation.

66144 `C` All but the last two digits of the year {2}; leading zeros shall be permitted but shall not
66145 be required. A leading `'+'` or `'−'` character shall be permitted before any leading zeros
66146 but shall not be required.

66147 `d` The day of the month [01,31]; leading zeros shall be permitted but shall not be required.

66148 `D` The date as `%m/%d/%y`.

66149 `e` Equivalent to `%d`.

66150 `h` Equivalent to `%b`.

66151 `H` The hour (24-hour clock) [00,23]; leading zeros shall be permitted but shall not be
66152 required.

66153 `I` The hour (12-hour clock) [01,12]; leading zeros shall be permitted but shall not be
66154 required.

66155 `j` The day number of the year [001,366]; leading zeros shall be permitted but shall not be
66156 required.

66157 `m` The month number [01,12]; leading zeros shall be permitted but shall not be required.

66158 `M` The minute [00,59]; leading zeros shall be permitted but shall not be required.

66159 `n` Any white space.

66160 `p` The locale's equivalent of a.m. or p.m.

66161 `r` 12-hour clock time using the AM/PM notation if **t_fmt_ampm** is not an empty string in
66162 the *LC_TIME* portion of the current locale; in the POSIX locale, this shall be equivalent
66163 to `%I:%M:%S %p`.

66164 `R` The time as `%H:%M`.

66165 `S` The seconds [00,60]; leading zeros shall be permitted but shall not be required.

66166 `t` Any white space.

66167 `T` The time as `%H:%M:%S`.

66168 `U` The week number of the year (Sunday as the first day of the week) as a decimal
66169 number [00,53]; leading zeros shall be permitted but shall not be required.

66170 `w` The weekday as a decimal number [0,6], with 0 representing Sunday.

66171 `W` The week number of the year (Monday as the first day of the week) as a decimal
66172 number [00,53]; leading zeros shall be permitted but shall not be required.

66173 `x` The date, using the locale's date format.

66174 `X` The time, using the locale's time format.

66175 `y` The last two digits of the year. When *format* contains neither a `C` conversion specifier
66176 nor a `Y` conversion specifier, values in the range [69,99] shall refer to years 1969 to 1999
66177 inclusive and values in the range [00,68] shall refer to years 2000 to 2068 inclusive;
66178 leading zeros shall be permitted but shall not be required. A leading `'+'` or `'−'`

66179 character shall be permitted before any leading zeros but shall not be required.

66180 **Note:** It is expected that in a future version of this standard the default century inferred
66181 from a 2-digit year will change. (This would apply to all commands accepting a
66182 2-digit year as input.)

66183 `Y` The full year {4}; leading zeros shall be permitted but shall not be required. A leading
66184 `'+'` or `'−'` character shall be permitted before any leading zeros but shall not be
66185 required.

66186 `%` Replaced by `%`.

66187 **Modified Conversion Specifiers**

66188 Some conversion specifiers can be modified by the `E` and `O` modifier characters to indicate that
66189 an alternative format or specification should be used rather than the one normally used by the
66190 unmodified conversion specifier. If the alternative format or specification does not exist in the
66191 current locale, the behavior shall be as if the unmodified conversion specification were used.

66192 `%Ec` The locale's alternative appropriate date and time representation.

66193 `%EC` The name of the base year (period) in the locale's alternative representation.

66194 `%Ex` The locale's alternative date representation.

66195 `%EX` The locale's alternative time representation.

66196 `%Ey` The offset from `%EC` (year only) in the locale's alternative representation.

66197 `%EY` The full alternative year representation.

66198 `%Od` The day of the month using the locale's alternative numeric symbols; leading zeros
66199 shall be permitted but shall not be required.

66200 `%Oe` Equivalent to `%Od`.

66201 `%OH` The hour (24-hour clock) using the locale's alternative numeric symbols.

66202 `%OI` The hour (12-hour clock) using the locale's alternative numeric symbols.

66203 `%Om` The month using the locale's alternative numeric symbols.

66204 `%OM` The minutes using the locale's alternative numeric symbols.

66205 `%OS` The seconds using the locale's alternative numeric symbols.

66206 `%OU` The week number of the year (Sunday as the first day of the week) using the locale's
66207 alternative numeric symbols.

66208 `%Ow` The number of the weekday (Sunday=0) using the locale's alternative numeric
66209 symbols.

66210 `%OW` The week number of the year (Monday as the first day of the week) using the locale's
66211 alternative numeric symbols.

66212 `%Oy` The year (offset from `%C`) using the locale's alternative numeric symbols.

66213 A conversion specification composed of white-space characters is executed by scanning input up
66214 to the first character that is not white-space (which remains unscanned), or until no more
66215 characters can be scanned.

66216 A conversion specification that is an ordinary character is executed by scanning the next
66217 character from the buffer. If the character scanned from the buffer differs from the one
66218 comprising the directive, the directive fails, and the differing and subsequent characters remain

66219 unscanned.

66220 A series of conversion specifications composed of `%n`, `%t`, white-space characters, or any
66221 combination is executed by scanning up to the first character that is not white space (which
66222 remains unscanned), or until no more characters can be scanned.

66223 Any other conversion specification is executed by scanning characters until a character matching
66224 the next directive is scanned, or until no more characters can be scanned. These characters,
66225 except the one matching the next directive, are then compared to the locale values associated
66226 with the conversion specifier. If a match is found, values for the appropriate **tm** structure
66227 members are set to values corresponding to the locale information. Case is ignored when
66228 matching items in *buf* such as month or weekday names. If no match is found, *strptime*( ) fails
66229 and no more characters are scanned.

66230 **RETURN VALUE**

66231 Upon successful completion, *strptime*( ) shall return a pointer to the character following the last
66232 character parsed. Otherwise, a null pointer shall be returned.

66233 **ERRORS**

66234 No errors are defined.

66235 **EXAMPLES**

66236 **Convert a Date-Plus-Time String to Broken-Down Time and Then into Seconds**

66237 The following example demonstrates the use of *strptime*( ) to convert a string into broken-down
66238 time. The broken-down time is then converted into seconds since the Epoch using *mktime*( ).

```
66239 #include <time.h>
66240 ...

66241 struct tm tm;
66242 time_t t;

66243 if (strptime("6 Dec 2001 12:33:45", "%d %b %Y %H:%M:%S", &tm) == NULL)
66244     /* Handle error */;

66245 printf("year: %d; month: %d; day: %d;\n",
66246         tm.tm_year, tm.tm_mon, tm.tm_mday);
66247 printf("hour: %d; minute: %d; second: %d\n",
66248         tm.tm_hour, tm.tm_min, tm.tm_sec);
66249 printf("week day: %d; year day: %d\n", tm.tm_wday, tm.tm_yday);

66250 tm.tm_isdst = -1;      /* Not set by strptime(); tells mktime()
66251                           to determine whether daylight saving time
66252                           is in effect */
66253 t = mktime(&tm);
66254 if (t == -1)
66255     /* Handle error */;
66256 printf("seconds since the Epoch: %ld\n", (long) t);"
```

66257 **APPLICATION USAGE**

66258 Several ``equivalent to'' formats and the special processing of white-space characters are
66259 provided in order to ease the use of identical *format* strings for *strftime*( ) and *strptime*( ).

66260 It should be noted that dates constructed by the *strftime*( ) function with the `%Y` or `%C%y`
66261 conversion specifiers may have values larger than 9 999. If the *strptime*( ) function is used to read
66262 such values using `%C%y` or `%Y`, the year values will be truncated to four digits. Applications

should use %+*w*%y or %+*x*Y with *w* and *x* set large enough to contain the full value of any years that will be printed or scanned.

See also the APPLICATION USAGE section in *strftime*( ).

It is unspecified whether multiple calls to *strptime*( ) using the same **tm** structure will update the current contents of the structure or overwrite all contents of the structure. Conforming applications should make a single call to *strptime*( ) with a format and all data needed to completely specify the date and time being converted.

RATIONALE

See the RATIONALE section for *strftime*( ).

FUTURE DIRECTIONS

None.

XBD **<time.h>**

CHANGE HISTORY

First released in Issue 4.

Issue 5

Moved from ENHANCED I18N to BASE.

The [ENOSYS] error is removed.

The exact meaning of the %y and %Oy specifiers is clarified in the DESCRIPTION.

Issue 6

The Open Group Corrigendum U033/5 is applied. The %r specifier description is reworded.

The normative text is updated to avoid use of the term ``must'' for application requirements.

The **restrict** keyword is added to the *strptime*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

The Open Group Corrigendum U047/2 is applied.

The DESCRIPTION is updated to use the terms ``conversion specifier'' and ``conversion specification'' for consistency with *strftime*( ).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/133 is applied, adding the example to the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #041 is applied, updating the DESCRIPTION and APPLICATION USAGE sections.

Austin Group Interpretation 1003.1-2001 #163 is applied.

SD5-XSH-ERN-67 is applied, correcting the APPLICATION USAGE to remove the impression that %Y is 4-digit years.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0345 [920] and XSH/TC2-2008/0346 [919] are applied.

66301 **NAME**

66302 strrchr — string scanning operation

66303 **SYNOPSIS**

66304
```
#include <string.h>
```

66305
```
char *strrchr(const char *s, int c);
```

66306 **DESCRIPTION**

66307 CX The functionality described on this reference page is aligned with the ISO C standard. Any
66308 conflict between the requirements described here and the ISO C standard is unintentional. This
66309 volume of POSIX.1-2017 defers to the ISO C standard.

66310 The *strrchr*( ) function shall locate the last occurrence of *c* (converted to a **char**) in the string
66311 pointed to by *s*. The terminating NUL character is considered to be part of the string.

66312 **RETURN VALUE**

66313 Upon successful completion, *strrchr*( ) shall return a pointer to the byte or a null pointer if *c* does
66314 not occur in the string.

66315 **ERRORS**

66316 No errors are defined.

66317 **EXAMPLES**

66318 **Finding the Base Name of a File**

66319 The following example uses *strrchr*( ) to get a pointer to the base name of a file. The *strrchr*( )
66320 function searches backwards through the name of the file to find the last `'/'` character in *name*.
66321 This pointer (plus one) will point to the base name of the file.

66322
```
#include <string.h>
```
66323
```
...
```
66324
```
const char *name;
```
66325
```
char *basename;
```
66326
```
...
```
66327
```
basename = strrchr(name, '/') + 1;
```
66328
```
...
```

66329 **APPLICATION USAGE**

66330 None.

66338 **CHANGE HISTORY**

66339 First released in Issue 1. Derived from Issue 1 of the SVID.

NAME

strsignal ‡'get name of signal

SYNOPSIS

CX
```
#include <string.h>

char *strsignal(int signum);
```

DESCRIPTION

The *strsignal*( ) function shall map the signal number in *signum* to an implementation-defined string and shall return a pointer to it. It shall use the same set of messages as the *psignal*( ) function.

The application shall not modify the string returned. The returned pointer might be invalidated or the string content might be overwritten by a subsequent call to *strsignal*( ) or *setlocale*( ). The returned pointer might also be invalidated if the calling thread is terminated.

The contents of the message strings returned by *strsignal*( ) should be determined by the setting of the *LC_MESSAGES* category in the current locale.

The implementation shall behave as if no function defined in this standard calls *strsignal*( ).

Since no return value is reserved to indicate an error, an application wishing to check for error situations should set *errno* to 0, then call *strsignal*( ), then check *errno*.

The *strsignal*( ) function need not be thread-safe.

RETURN VALUE

Upon successful completion, *strsignal*( ) shall return a pointer to a string. Otherwise, if *signum* is not a valid signal number, the return value is unspecified.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If *signum* is not a valid signal number, some implementations return NULL, while for others the *strsignal*( ) function returns a pointer to a string containing an unspecified message denoting an unknown signal. POSIX.1-2017 leaves this return value unspecified.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 7.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0609 [75] is applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0347 [656] is applied.

66380 **NAME**

66381 strspn ‡'get length of a substring

66382 **SYNOPSIS**

66383 `#include <string.h>`

66384 `size_t strspn(const char *s1, const char *s2);`

66385 **DESCRIPTION**

66386 CX The functionality described on this reference page is aligned with the ISO C standard. Any
66387 conflict between the requirements described here and the ISO C standard is unintentional. This
66388 volume of POSIX.1-2017 defers to the ISO C standard.

66389 The *strspn*( ) function shall compute the length (in bytes) of the maximum initial segment of the
66390 string pointed to by *s1* which consists entirely of bytes from the string pointed to by *s2*.

66391 **RETURN VALUE**

66392 The *strspn*( ) function shall return the computed length; no return value is reserved to indicate an
66393 error.

66394 **ERRORS**

66395 No errors are defined.

66396 **EXAMPLES**

66397 None.

66398 **APPLICATION USAGE**

66399 None.

66407 **CHANGE HISTORY**

66408 First released in Issue 1. Derived from Issue 1 of the SVID.

66409 **Issue 5**

66410 The RETURN VALUE section is updated to indicate that *strspn*( ) returns the length of *s*, and not
66411 *s* itself as was previously stated.

66412 **Issue 7**

66413 SD5-XSH-ERN-182 is applied.

NAME

strstr ‡'find a substring

SYNOPSIS

```
#include <string.h>

char *strstr(const char *s1, const char *s2);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

The *strstr*( ) function shall locate the first occurrence in the string pointed to by *s1* of the sequence of bytes (excluding the terminating NUL character) in the string pointed to by *s2*.

RETURN VALUE

Upon successful completion, *strstr*( ) shall return a pointer to the located string or a null pointer if the string is not found.

If *s2* points to a string with zero length, the function shall return *s1*.

ERRORS

No errors are defined.

EXAMPLES

CHANGE HISTORY

First released in Issue 3. Included for alignment with the ANSI C standard.

NAME

strtod, strtof, strtold — convert a string to a double-precision number

SYNOPSIS

```
#include <stdlib.h>

double strtod(const char *restrict nptr, char **restrict endptr);
float strtof(const char *restrict nptr, char **restrict endptr);
long double strtold(const char *restrict nptr, char **restrict endptr);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall convert the initial portion of the string pointed to by *nptr* to **double**, **float**, and **long double** representation, respectively. First, they decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace*( ))
2. A subject sequence interpreted as a floating-point constant or representing infinity or NaN
3. A final string of one or more unrecognized characters, including the terminating NUL character of the input string

Then they shall attempt to convert the subject sequence to a floating-point number, and return the result.

The expected form of the subject sequence is an optional `'+'` or `'−'` sign, then one of the following:

A non-empty sequence of decimal digits optionally containing a radix character; then an optional exponent part consisting of the character `'e'` or the character `'E'`, optionally followed by a `'+'` or `'−'` character, and then followed by one or more decimal digits

A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix character; then an optional binary exponent part consisting of the character `'p'` or the character `'P'`, optionally followed by a `'+'` or `'−'` character, and then followed by one or more decimal digits

One of INF or INFINITY, ignoring case

One of NAN or NAN(*n-char-sequence*$_{opt}$), ignoring case in the NAN part, where:

```
n-char-sequence:
    digit
    nondigit
    n-char-sequence digit
    n-char-sequence nondigit
```

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character, that is of the expected form. The subject sequence contains no characters if the input string is not of the expected form.

If the subject sequence has the expected form for a floating-point number, the sequence of characters starting with the first digit or the decimal-point character (whichever occurs first) shall be interpreted as a floating constant of the C language, except that the radix character shall be used in place of a period, and that if neither an exponent part nor a radix character appears in

a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal floating-point number, an exponent part of the appropriate type with value zero is assumed to follow the last digit in the string. If the subject sequence begins with a <hyphen-minus>, the sequence shall be interpreted as negated. A character sequence INF or INFINITY shall be interpreted as an infinity, if representable in the return type, else as if it were a floating constant that is too large for the range of the return type. A character sequence NAN or NAN(*n-char-sequence*$_{opt}$) shall be interpreted as a quiet NaN, if supported in the return type, else as if it were a subject sequence part that does not have the expected form; the meaning of the *n*-char sequences is implementation-defined. A pointer to the final string is stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

If the subject sequence has the hexadecimal form and FLT_RADIX is a power of 2, the value resulting from the conversion is correctly rounded.

CX The radix character is defined in the current locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a <period> (`'.'`).

CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be accepted.

If the subject sequence is empty or does not have the expected form, no conversion shall be performed; the value of *nptr* is stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

These functions shall not change the setting of *errno* if successful.

Since 0 is returned on error and is also a valid return on success, an application wishing to check for error situations should set *errno* to 0, then call *strtod*( ), *strtof*( ), or *strtold*( ), then check *errno*.

RETURN VALUE

Upon successful completion, these functions shall return the converted value. If no conversion could be performed, 0 shall be returned, and *errno* may be set to [EINVAL].

If the correct value is outside the range of representable values, ±HUGE_VAL, ±HUGE_VALF, or ±HUGE_VALL shall be returned (according to the sign of the value), and *errno* shall be set to [ERANGE].

If the correct value would cause an underflow, a value whose magnitude is no greater than the smallest normalized positive number in the return type shall be returned and *errno* set to [ERANGE].

ERRORS

These functions shall fail if:

CX [ERANGE] The value to be returned would cause overflow or underflow.

These functions may fail if:

CX [EINVAL] No conversion could be performed.

EXAMPLES

None.

APPLICATION USAGE

If the subject sequence has the hexadecimal form and FLT_RADIX is not a power of 2, and the result is not exactly representable, the result should be one of the two numbers in the appropriate internal format that are adjacent to the hexadecimal floating source value, with the extra stipulation that the error should have a correct sign for the current rounding direction.

If the subject sequence has the decimal form and at most DECIMAL_DIG (defined in **<float.h>**) significant digits, the result should be correctly rounded. If the subject sequence *D* has the decimal form and more than DECIMAL_DIG significant digits, consider the two bounding, adjacent decimal strings *L* and *U*, both having DECIMAL_DIG significant digits, such that the values of *L*, *D*, and *U* satisfy *L* <= *D* <= *U*. The result should be one of the (equal or adjacent) values that would be obtained by correctly rounding *L* and *U* according to the current rounding direction, with the extra stipulation that the error with respect to *D* should have a correct sign for the current rounding direction.

The changes to *strtod*( ) introduced by the ISO/IEC 9899:1999 standard can alter the behavior of well-formed applications complying with the ISO/IEC 9899:1990 standard and thus earlier versions of this standard. One such example would be:

```
int
what_kind_of_number (char *s)
{
    char *endp;
    double d;
    long l;

    d = strtod(s, &endp);
    if (s != endp && *endp == `\0')
        printf("It's a float with value %g\n", d);
    else
    {
        l = strtol(s, &endp, 0);
        if (s != endp && *endp == `\0')
            printf("It's an integer with value %ld\n", 1);
        else
            return 1;
    }
    return 0;
}
```

If the function is called with:

```
what_kind_of_number ("0x10")
```

an ISO/IEC 9899:1990 standard-compliant library will result in the function printing:

```
It's an integer with value 16
```

With the ISO/IEC 9899:1999 standard, the result is:

```
It's a float with value 16
```

The change in behavior is due to the inclusion of floating-point numbers in hexadecimal notation without requiring that either a decimal point or the binary exponent be present.

66570 **RATIONALE**

66571 None.

66572 **FUTURE DIRECTIONS**

66573 None.

66574 **SEE ALSO**

66575 *fscanf*( ), *isspace*( ), *localeconv*( ), *setlocale*( ), *strtol*( )

66576 XBD Chapter 7 (on page 135), **<float.h>**, **<stdlib.h>**

66577 **CHANGE HISTORY**

66578 First released in Issue 1. Derived from Issue 1 of the SVID.

66579 **Issue 5**

66580 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

66581 **Issue 6**

66582 Extensions beyond the ISO C standard are marked.

66583 The following new requirements on POSIX implementations derive from alignment with the
66584 Single UNIX Specification:

66585 In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
66586 added if no conversion could be performed.

66587 The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

66588 The *strtod*( ) function is updated.

66589 The *strtof*( ) and *strtold*( ) functions are added.

66590 The DESCRIPTION is extensively revised.

66591 ISO/IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.

66592 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/61 is applied, correcting the second
66593 paragraph in the RETURN VALUE section. This change clarifies the sign of the return value.

66594 **Issue 7**

66595 Austin Group Interpretation 1003.1-2001 #015 is applied.

66596 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0610 [302], XSH/TC1-2008/0611 [94],
66597 and XSH/TC1-2008/0612 [105] are applied.

66598 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0348 [584] and XSH/TC2-2008/0349
66599 [796] are applied.

66600 **NAME**

66601 strtoimax, strtoumax ‡'convert string to integer type

66602 **SYNOPSIS**

66603
```
#include <inttypes.h>
```

66604
```
intmax_t strtoimax(const char *restrict nptr, char **restrict endptr,
```
66605
```
    int base);
```
66606
```
uintmax_t strtoumax(const char *restrict nptr, char **restrict endptr,
```
66607
```
    int base);
```

66608 **DESCRIPTION**

66609 CX The functionality described on this reference page is aligned with the ISO C standard. Any
66610 conflict between the requirements described here and the ISO C standard is unintentional. This
66611 volume of POSIX.1-2017 defers to the ISO C standard.

66612 These functions shall be equivalent to the *strtol*( ), *strtoll*( ), *strtoul*( ), and *strtoull*( ) functions,
66613 except that the initial portion of the string shall be converted to **intmax_t** and **uintmax_t**
66614 representation, respectively.

66615 **RETURN VALUE**

66616 These functions shall return the converted value, if any.

66617 CX If no conversion could be performed, zero shall be returned and *errno* may be set to [EINVAL].

66618 CX If the value of *base* is not supported, 0 shall be returned and *errno* shall be set to [EINVAL].

66619 If the correct value is outside the range of representable values, {INTMAX_MAX},
66620 {INTMAX_MIN}, or {UINTMAX_MAX} shall be returned (according to the return type and sign
66621 of the value, if any), and *errno* shall be set to [ERANGE].

66622 **ERRORS**

66623 These functions shall fail if:

66624 CX [EINVAL] The value of *base* is not supported.

66625 [ERANGE] The value to be returned is not representable.

66626 These functions may fail if:

66627 [EINVAL] No conversion could be performed.

66628 **EXAMPLES**

66629 None.

66630 **APPLICATION USAGE**

66631 Since the value of **endptr* is unspecified if the value of *base* is not supported, applications should
66632 either ensure that *base* has a supported value (0 or between 2 and 36) before the call, or check for
66633 an [EINVAL] error before examining **endptr*.

66634 **RATIONALE**

66635 None.

66636 **FUTURE DIRECTIONS**

66637 None.

66641 **CHANGE HISTORY**

66642 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

66643 **Issue 7**

66644 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0613 [453] and XSH/TC1-2008/0614
66645 [453] are applied.

66646 **NAME**

66647 strtok, strtok_r ‡'split string into tokens

66648 **SYNOPSIS**

66649
```
#include <string.h>
```

66650
```
char *strtok(char *restrict s, const char *restrict sep);
```

66651 CX
```
char *strtok_r(char *restrict s, const char *restrict sep,
    char **restrict state);
```

66653 **DESCRIPTION**

66654 CX For *strtok*( ): The functionality described on this reference page is aligned with the ISO C
66655 standard. Any conflict between the requirements described here and the ISO C standard is
66656 unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

66657 A sequence of calls to *strtok*( ) breaks the string pointed to by *s* into a sequence of tokens, each of
66658 which is delimited by a byte from the string pointed to by *sep*. The first call in the sequence has *s*
66659 as its first argument, and is followed by calls with a null pointer as their first argument. The
66660 separator string pointed to by *sep* may be different from call to call.

66661 The first call in the sequence searches the string pointed to by *s* for the first byte that is *not*
66662 contained in the current separator string pointed to by *sep*. If no such byte is found, then there
66663 are no tokens in the string pointed to by *s* and *strtok*( ) shall return a null pointer. If such a byte is
66664 found, it is the start of the first token.

66665 The *strtok*( ) function then searches from there for a byte that *is* contained in the current separator
66666 string. If no such byte is found, the current token extends to the end of the string pointed to by *s*,
66667 and subsequent searches for a token shall return a null pointer. If such a byte is found, it is
66668 overwritten by a NUL character, which terminates the current token. The *strtok*( ) function saves
66669 a pointer to the following byte, from which the next search for a token shall start.

66670 Each subsequent call, with a null pointer as the value of the first argument, starts searching from
66671 the saved pointer and behaves as described above.

66672 The implementation shall behave as if no function defined in this volume of POSIX.1-2017 calls
66673 *strtok*( ).

66674 CX The *strtok*( ) function need not be thread-safe.

66675 The *strtok_r*( ) function shall be equivalent to *strtok*( ), except that *strtok_r*( ) shall be thread-safe
66676 and the argument *state* points to a user-provided pointer that allows *strtok_r*( ) to maintain state
66677 between calls which scan the same string. The application shall ensure that the pointer pointed
66678 to by *state* is unique for each string (*s*) being processed concurrently by *strtok_r*( ) calls. The
66679 application need not initialize the pointer pointed to by *state* to any particular value. The
66680 implementation shall not update the pointer pointed to by *state* to point (directly or indirectly) to
66681 resources, other than within the string *s*, that need to be freed or released by the caller.

66682 **RETURN VALUE**

66683 Upon successful completion, *strtok*( ) shall return a pointer to the first byte of a token. Otherwise,
66684 if there is no token, *strtok*( ) shall return a null pointer.

66685 CX The *strtok_r*( ) function shall return a pointer to the token found, or a null pointer when no token
66686 is found.

66687 **ERRORS**

66688 No errors are defined.

66689 **EXAMPLES**

66690 **Searching for Word Separators**

66691 The following example searches for tokens separated by <space> characters.

```
66692 #include <string.h>
66693 ...
66694 char *token;
66695 char line[] = "LINE TO BE SEPARATED";
66696 char *search = " ";
66697 /* Token will point to "LINE". */
66698 token = strtok(line, search);
66699 /* Token will point to "TO". */
66700 token = strtok(NULL, search);
```

66701 **Find First two Fields in a Buffer**

66702 The following example uses *strtok*( ) to find two character strings (a key and data associated with
66703 that key) separated by any combination of <space>, <tab>, or <newline> characters at the start
66704 of the array of characters pointed to by *buffer*.

```
66705 #include <string.h>
66706 ...
66707 char    *buffer;
66708 ...
66709 struct element {
66710     char *key;
66711     char *data;
66712 } e;
66713 ...
66714 // Load the buffer...
66715 ...
66716 // Get the key and its data...
66717 e.key = strtok(buffer, " \t\n");
66718 e.data = strtok(NULL, " \t\n");
66719 // Process the rest of the contents of the buffer...
66720 ...
```

66721 **APPLICATION USAGE**

66722 Note that if *sep* is the empty string, *strtok*( ) and *strtok_r*( ) return a pointer to the remainder of the
66723 string being tokenized.

66724 The *strtok_r*( ) function is thread-safe and stores its state in a user-supplied buffer instead of
66725 possibly using a static data area that may be overwritten by an unrelated call from another
66726 thread.

66727 **RATIONALE**

66728 The *strtok*( ) function searches for a separator string within a larger string. It returns a pointer to
66729 the last substring between separator strings. This function uses static storage to keep track of
66730 the current string position between calls. The new function, *strtok_r*( ), takes an additional

66731 argument, *state*, to keep track of the current position in the string.

66732 **FUTURE DIRECTIONS**

66733 None.

66734 **SEE ALSO**

66735 XBD **<string.h>**

66736 **CHANGE HISTORY**

66737 First released in Issue 1. Derived from Issue 1 of the SVID.

66738 **Issue 5**

66739 The *strtok_r*( ) function is included for alignment with the POSIX Threads Extension.

66740 A note indicating that the *strtok*( ) function need not be reentrant is added to the DESCRIPTION.

66741 **Issue 6**

66742 Extensions beyond the ISO C standard are marked.

66743 The *strtok_r*( ) function is marked as part of the Thread-Safe Functions option.

66744 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

66745 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
66746 its avoidance of possibly using a static data area.

66747 The **restrict** keyword is added to the *strtok*( ) and *strtok_r*( ) prototypes for alignment with the
66748 ISO/IEC 9899:1999 standard.

66749 **Issue 7**

66750 Austin Group Interpretation 1003.1-2001 #156 is applied.

66751 SD5-XSH-ERN-235 is applied, correcting an example.

66752 The *strtok_r*( ) function is moved from the Thread-Safe Functions option to the Base.

66753 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0615 [177] is applied.

66754 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0350 [878] is applied.

NAME

strtol, strtoll ‡'convert a string to a long integer

SYNOPSIS

```
#include <stdlib.h>

long strtol(const char *restrict nptr, char **restrict endptr, int base);
long long strtoll(const char *restrict nptr, char **restrict endptr,
    int base)
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall convert the initial portion of the string pointed to by *nptr* to a type **long** and **long long** representation, respectively. First, they decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace*( ))
2. A subject sequence interpreted as an integer represented in some radix determined by the value of *base*
3. A final string of one or more unrecognized characters, including the terminating NUL character of the input string.

Then they shall attempt to convert the subject sequence to an integer, and return the result.

If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '−' sign. A decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence of letters and digits representing an integer with the radix specified by *base*, optionally preceded by a '+' or '−' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and digits, following the sign if present.

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character that is of the expected form. The subject sequence shall contain no characters if the input string is empty or consists entirely of white-space characters, or if the first non-white-space character is other than a sign or a permissible letter or digit.

If the subject sequence has the expected form and the value of *base* is 0, the sequence of characters starting with the first digit shall be interpreted as an integer constant. If the subject sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the base for conversion, ascribing to each letter its value as given above. If the subject sequence begins with a <hyphen-minus>, the value resulting from the conversion shall be negated. A pointer to the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be accepted.

If the subject sequence is empty or does not have the expected form, no conversion is performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

These functions shall not change the setting of *errno* if successful.

Since 0, {LONG_MIN} or {LLONG_MIN}, and {LONG_MAX} or {LLONG_MAX} are returned on error and are also valid returns on success, an application wishing to check for error situations should set *errno* to 0, then call *strtol*( ) or *strtoll*( ), then check *errno*.

RETURN VALUE

Upon successful completion, these functions shall return the converted value, if any. If no CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

CX If the value of *base* is not supported, 0 shall be returned and *errno* shall be set to [EINVAL].

If the correct value is outside the range of representable values, {LONG_MIN}, {LONG_MAX}, {LLONG_MIN}, or {LLONG_MAX} shall be returned (according to the sign of the value), and *errno* set to [ERANGE].

ERRORS

These functions shall fail if:

CX [EINVAL] The value of *base* is not supported.

[ERANGE] The value to be returned is not representable.

These functions may fail if:

[EINVAL] No conversion could be performed.

EXAMPLES

None.

APPLICATION USAGE

Since the value of **endptr* is unspecified if the value of *base* is not supported, applications should either ensure that *base* has a supported value (0 or between 2 and 36) before the call, or check for an [EINVAL] error before examining **endptr*.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

The *strtol*( ) prototype is updated.

The *strtoll*( ) function is added.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0616 [453], XSH/TC1-2008/0617 [105], XSH/TC1-2008/0618 [453], XSH/TC1-2008/0619 [453], and XSH/TC1-2008/0620 [453] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0351 [892], XSH/TC2-2008/0352 [584], XSH/TC2-2008/0353 [796], and XSH/TC2-2008/0354 [892] are applied.

66860 strtoll ‡'convert a string to a long integer

66861 **SYNOPSIS**

66862 ```
#include <stdlib.h>
```

66863 ```
long long strtoll(const char *restrict str, char **restrict endptr,
```

66864 ```
    int base);
```

66865 **DESCRIPTION**

66866 Refer to *strtol( )*.

  
```

66867 **NAME**

66868 strtoul, strtoull ‡'convert a string to an unsigned long

66869 **SYNOPSIS**

66870
```
#include <stdlib.h>
```

66871
```
unsigned long strtoul(const char *restrict str,
```
66872
```
    char **restrict endptr, int base);
```
66873
```
unsigned long long strtoull(const char *restrict str,
```
66874
```
    char **restrict endptr, int base);
```

66875 **DESCRIPTION**

66876 CX The functionality described on this reference page is aligned with the ISO C standard. Any
66877 conflict between the requirements described here and the ISO C standard is unintentional. This
66878 volume of POSIX.1-2017 defers to the ISO C standard.

66879 These functions shall convert the initial portion of the string pointed to by *str* to a type **unsigned**
66880 **long** and **unsigned long long** representation, respectively. First, they decompose the input string
66881 into three parts:

66882 1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace*( ))

66883 2. A subject sequence interpreted as an integer represented in some radix determined by the
66884 value of *base*

66885 3. A final string of one or more unrecognized characters, including the terminating NUL
66886 character of the input string

66887 Then they shall attempt to convert the subject sequence to an unsigned integer, and return the
66888 result.

66889 If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant,
66890 octal constant, or hexadecimal constant, any of which may be preceded by a `'+'` or `'−'` sign. A
66891 decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An
66892 octal constant consists of the prefix `'0'` optionally followed by a sequence of the digits `'0'` to
66893 `'7'` only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
66894 decimal digits and letters `'a'` (or `'A'`) to `'f'` (or `'F'`) with values 10 to 15 respectively.

66895 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence
66896 of letters and digits representing an integer with the radix specified by *base*, optionally preceded
66897 by a `'+'` or `'−'` sign. The letters from `'a'` (or `'A'`) to `'z'` (or `'Z'`) inclusive are ascribed the
66898 values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the
66899 value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and
66900 digits, following the sign if present.

66901 The subject sequence is defined as the longest initial subsequence of the input string, starting
66902 with the first non-white-space character that is of the expected form. The subject sequence shall
66903 contain no characters if the input string is empty or consists entirely of white-space characters,
66904 or if the first non-white-space character is other than a sign or a permissible letter or digit.

66905 If the subject sequence has the expected form and the value of *base* is 0, the sequence of
66906 characters starting with the first digit shall be interpreted as an integer constant. If the subject
66907 sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the
66908 base for conversion, ascribing to each letter its value as given above. If the subject sequence
66909 begins with a <hyphen-minus>, the value resulting from the conversion shall be negated. A
66910 pointer to the final string shall be stored in the object pointed to by *endptr*, provided that *endptr*
66911 is not a null pointer.

66912 CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be
66913 accepted.

66914 If the subject sequence is empty or does not have the expected form, no conversion shall be
66915 performed; the value of *str* shall be stored in the object pointed to by *endptr*, provided that *endptr*
66916 is not a null pointer.

66917 These functions shall not change the setting of *errno* if successful.

66918 Since 0, {ULONG_MAX}, and {ULLONG_MAX} are returned on error and are also valid returns
66919 on success, an application wishing to check for error situations should set *errno* to 0, then call
66920 *strtoul*( ) or *strtoull*( ), then check *errno*.

66921 **RETURN VALUE**

66922 Upon successful completion, these functions shall return the converted value, if any. If no
66923 CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

66924 CX If the value of *base* is not supported, 0 shall be returned and *errno* shall be set to [EINVAL].

66925 If the correct value is outside the range of representable values, {ULONG_MAX} or
66926 {ULLONG_MAX} shall be returned and *errno* set to [ERANGE].

66927 **ERRORS**

66928 These functions shall fail if:

66929 CX [EINVAL] The value of *base* is not supported.

66930 [ERANGE] The value to be returned is not representable.

66931 These functions may fail if:

66932 CX [EINVAL] No conversion could be performed.

66933 **EXAMPLES**

66934 None.

66935 **APPLICATION USAGE**

66936 Since the value of **endptr* is unspecified if the value of *base* is not supported, applications should
66937 either ensure that *base* has a supported value (0 or between 2 and 36) before the call, or check for
66938 an [EINVAL] error before examining **endptr*.

66939 **RATIONALE**

66940 None.

66941 **FUTURE DIRECTIONS**

66942 None.

66943 **SEE ALSO**

66944 *fscanf*( ), *isalpha*( ), *strtod*( ), *strtol*( )

66945 XBD **<stdlib.h>**

66946 **CHANGE HISTORY**

66947 First released in Issue 4. Derived from the ANSI C standard.

66948 **Issue 5**

66949 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EINVAL] error condition is added for when the value of *base* is not supported.
- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The *strtoul*( ) prototype is updated.
- The *strtoull*( ) function is added.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0621 [105], XSH/TC1-2008/0622 [453], and XSH/TC1-2008/0623 [453] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0355 [584] and XSH/TC2-2008/0356 [796] are applied.

66965 **NAME**

66966 strtoumax ‡′convert a string to an integer type

66967 **SYNOPSIS**

66968 ```
#include <inttypes.h>
```

66969 ```
uintmax_t strtoumax(const char *restrict nptr, char **restrict endptr,
```

66970 ```
    int base);
```

66971 **DESCRIPTION**

66972 Refer to *strtoimax( )*.

  
```

NAME

strxfrm, strxfrm_l ‡'string transformation

SYNOPSIS

```
#include <string.h>

size_t strxfrm(char *restrict s1, const char *restrict s2, size_t n);
CX size_t strxfrm_l(char *restrict s1, const char *restrict s2,
        size_t n, locale_t locale);
```

DESCRIPTION

CX For *strxfrm*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

CX The *strxfrm*( ) and *strxfrm_l*( ) functions shall transform the string pointed to by *s2* and place the resulting string into the array pointed to by *s1*. The transformation is such that if *strcmp*( ) is applied to two transformed strings, it shall return a value greater than, equal to, or less than 0, CX corresponding to the result of *strcoll*( ) or *strcoll_l*( ), respectively, applied to the same two CX original strings with the same locale. No more than *n* bytes are placed into the resulting array pointed to by *s1*, including the terminating NUL character. If *n* is 0, *s1* is permitted to be a null pointer. If copying takes place between objects that overlap, the behavior is undefined.

CX The *strxfrm*( ) and *strxfrm_l*( ) functions shall not change the setting of *errno* if successful.

Since no return value is reserved to indicate an error, an application wishing to check for error CX situations should set *errno* to 0, then call *strxfrm*( ) or *strxfrm_l*( ), then check *errno*.

CX The behavior is undefined if the *locale* argument to *strxfrm_l*( ) is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

CX Upon successful completion, *strxfrm*( ) and *strxfrm_l*( ) shall return the length of the transformed string (not including the terminating NUL character). If the value returned is *n* or more, the contents of the array pointed to by *s1* are unspecified.

CX On error, *strxfrm*( ) and *strxfrm_l*( ) may set *errno* but no return value is reserved to indicate an error.

ERRORS

These functions may fail if:

CX [EINVAL] The string pointed to by the *s2* argument contains characters outside the domain of the collating sequence.

EXAMPLES

None.

APPLICATION USAGE

The transformation function is such that two transformed strings can be ordered by *strcmp*( ) as appropriate to collating sequence information in the current locale (category *LC_COLLATE*).

The fact that when *n* is 0 *s1* is permitted to be a null pointer is useful to determine the size of the *s1* array prior to making the transformation.

67013 **RATIONALE**

67014 None.

67015 **FUTURE DIRECTIONS**

67016 None.

67017 **SEE ALSO**

67018 *strcmp( )*, *strcoll( )*

67019 XBD **<string.h>**

67020 **CHANGE HISTORY**

67021 First released in Issue 3. Included for alignment with the ISO C standard.

67022 **Issue 5**

67023 The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.

67024 **Issue 6**

67025 Extensions beyond the ISO C standard are marked.

67026 The following new requirements on POSIX implementations derive from alignment with the
67027 Single UNIX Specification:

67028 In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
67029 added if no conversion could be performed.

67030 The *strxfrm( )* prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

67031 **Issue 7**

67032 The *strxfrm_l( )* function is added from The Open Group Technical Standard, 2006, Extended API
67033 Set Part 4.

67034 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0624 [283], XSH/TC1-2008/0625 [283],
67035 and XSH/TC1-2008/0626 [302] are applied.

67036 **NAME**

67037 swab ‡’swap bytes

67038 **SYNOPSIS**

67039 XSI
```
#include <unistd.h>

void swab(const void *restrict src, void *restrict dest,
    ssize_t nbytes);
```

67042 **DESCRIPTION**

67043 The *swab*( ) function shall copy *nbytes* bytes, which are pointed to by *src*, to the object pointed to
67044 by *dest*, exchanging adjacent bytes. The *nbytes* argument should be even. If *nbytes* is odd, *swab*( )
67045 copies and exchanges *nbytes*–1 bytes and the disposition of the last byte is unspecified. If
67046 copying takes place between objects that overlap, the behavior is undefined. If *nbytes* is
67047 negative, *swab*( ) does nothing.

67048 **RETURN VALUE**

67049 None.

67050 **ERRORS**

67051 No errors are defined.

67052 **EXAMPLES**

67053 None.

67054 **APPLICATION USAGE**

67055 None.

67056 **RATIONALE**

67057 None.

67058 **FUTURE DIRECTIONS**

67059 None.

67060 **SEE ALSO**

67062 **CHANGE HISTORY**

67063 First released in Issue 1. Derived from Issue 1 of the SVID.

67064 **Issue 6**

67065 The **restrict** keyword is added to the *swab*( ) prototype for alignment with the
67066 ISO/IEC 9899: 1999 standard.

67067 **NAME**

67068 swprintf ‡'print formatted wide-character output

67069 **SYNOPSIS**

67070 `#include <stdio.h>`
67071 `#include <wchar.h>`

67072 `int swprintf(wchar_t *restrict ws, size_t n,`
67073 `const wchar_t *restrict format, ...);`

67074 **DESCRIPTION**

67075 Refer to *fwprintf( )*.

67076 **NAME**

67077 swscanf ‡'convert formatted wide-character input

67078 **SYNOPSIS**

67079 ```
#include <stdio.h>
```

67080 ```
#include <wchar.h>
```

67081 ```
int swscanf(const wchar_t *restrict ws,
```

67082 ```
    const wchar_t *restrict format, ...);
```

67083 **DESCRIPTION**

67084 Refer to *fwscanf( )*.

67085 **NAME**

67086 symlink, symlinkat ‡'make a symbolic link

67087 **SYNOPSIS**

67088
```
#include <unistd.h>
```

67089
```
int symlink(const char *path1, const char *path2);
```

67090 OH
```
#include <fcntl.h>
```

67091
```
int symlinkat(const char *path1, int fd, const char *path2);
```

67092 **DESCRIPTION**

67093 The *symlink*( ) function shall create a symbolic link called *path2* that contains the string pointed to
67094 by *path1* (*path2* is the name of the symbolic link created, *path1* is the string contained in the
67095 symbolic link).

67096 The string pointed to by *path1* shall be treated only as a string and shall not be validated as a
67097 pathname.

67098 If the *symlink*( ) function fails for any reason other than [EIO], any file named by *path2* shall be
67099 unaffected.

67100 If *path2* names a symbolic link, *symlink*( ) shall fail and set *errno* to [EEXIST].

67101 The symbolic link's user ID shall be set to the process' effective user ID. The symbolic link's
67102 group ID shall be set to the group ID of the parent directory or to the effective group ID of the
67103 process. Implementations shall provide a way to initialize the symbolic link's group ID to the
67104 group ID of the parent directory. Implementations may, but need not, provide an
67105 implementation-defined way to initialize the symbolic link's group ID to the effective group ID
67106 of the calling process.

67107 The values of the file mode bits for the created symbolic link are unspecified. All interfaces
67108 specified by POSIX.1-2017 shall behave as if the contents of symbolic links can always be read,
67109 except that the value of the file mode bits returned in the *st_mode* field of the **stat** structure is
67110 unspecified.

67111 Upon successful completion, *symlink*( ) shall mark for update the last data access, last data
67112 modification, and last file status change timestamps of the symbolic link. Also, the last data
67113 modification and last file status change timestamps of the directory that contains the new entry
67114 shall be marked for update.

67115 The *symlinkat*( ) function shall be equivalent to the *symlink*( ) function except in the case where
67116 *path2* specifies a relative path. In this case the symbolic link is created relative to the directory
67117 associated with the file descriptor *fd* instead of the current working directory. If the access mode
67118 of the open file description associated with the file descriptor is not O_SEARCH, the function
67119 shall check whether directory searches are permitted using the current permissions of the
67120 directory underlying the file descriptor. If the access mode is O_SEARCH, the function shall not
67121 perform the check.

67122 If *symlinkat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working
67123 directory shall be used and the behavior shall be identical to a call to *symlink*( ).

67124 **RETURN VALUE**

67125 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
67126 return –1 and set *errno* to indicate the error.

67127 **ERRORS**

67128 These functions shall fail if:

67129 [EACCES] Write permission is denied in the directory where the symbolic link is being
67130 created, or search permission is denied for a component of the path prefix of
67131 *path2*.

67132 [EEXIST] The *path2* argument names an existing file.

67133 [EIO] An I/O error occurs while reading from or writing to the file system.

67134 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path2*
67135 argument.

67136 [ENAMETOOLONG]
67137 The length of a component of the pathname specified by the *path2* argument is
67138 longer than {NAME_MAX} or the length of the *path1* argument is longer than
67139 {SYMLINK_MAX}.

67140 [ENOENT] A component of the path prefix of *path2* does not name an existing file or *path2*
67141 is an empty string.

67142 [ENOENT] or [ENOTDIR]
67143 The *path2* argument contains at least one non-<slash> character and ends with
67144 one or more trailing <slash> characters. If *path2* without the trailing <slash>
67145 characters would name an existing file, an [ENOENT] error shall not occur.

67146 [ENOSPC] The directory in which the entry for the new symbolic link is being placed
67147 cannot be extended because no space is left on the file system containing the
67148 directory, or the new symbolic link cannot be created because no space is left
67149 on the file system which shall contain the link, or the file system is out of file-
67150 allocation resources.

67151 [ENOTDIR] A component of the path prefix of *path2* names an existing file that is neither a
67152 directory nor a symbolic link to a directory.

67153 [EROFS] The new symbolic link would reside on a read-only file system.

67154 The *symlinkat*( ) function shall fail if:

67155 [EACCES] The access mode of the open file description associated with *fd* is not
67156 O_SEARCH and the permissions of the directory underlying *fd* do not permit
67157 directory searches.

67158 [EBADF] The *path2* argument does not specify an absolute path and the *fd* argument is
67159 neither AT_FDCWD nor a valid file descriptor open for reading or searching.

67160 [ENOTDIR] The *path2* argument is not an absolute path and *fd* is a file descriptor
67161 associated with a non-directory file.

67162 These functions may fail if:

67163 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
67164 resolution of the *path2* argument.

67165 [ENAMETOOLONG]
67166 The length of the *path2* argument exceeds {PATH_MAX} or pathname
67167 resolution of a symbolic link in the *path2* argument produced an intermediate
67168 result with a length that exceeds {PATH_MAX}.

EXAMPLES

None.

APPLICATION USAGE

Like a hard link, a symbolic link allows a file to have multiple logical names. The presence of a hard link guarantees the existence of a file, even after the original name has been removed. A symbolic link provides no such assurance; in fact, the file named by the *path1* argument need not exist when the link is created. A symbolic link can cross file system boundaries.

Normal permission checks are made on each component of the symbolic link pathname during its resolution.

RATIONALE

The purpose of the *symlinkat*( ) function is to create symbolic links in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *symlink*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *symlinkat*( ) function it can be guaranteed that the created symbolic link is located relative to the desired directory.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The following changes were made to align with the IEEE P1003.1a draft standard:

The DESCRIPTION text is updated.

The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *symlinkat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Additions have been made describing how *symlink*( ) sets the user and group IDs and file mode of the symbolic link, and its effect on timestamps.

Changes are made to allow a directory to be opened for searching.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0627 [146,428], XSH/TC1-2008/0628 [461], XSH/TC1-2008/0629 [146,428], XSH/TC1-2008/0630 [146,428,436], XSH/TC1-2008/0631 [324], XSH/TC1-2008/0632 [278], XSH/TC1-2008/0633 [278], and XSH/TC1-2008/0634 [151] are applied.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0357 [873], XSH/TC2-2008/0358 [591], XSH/TC2-2008/0359 [641], XSH/TC2-2008/0360 [817], XSH/TC2-2008/0361 [822], XSH/TC2-2008/0362 [817], and XSH/TC2-2008/0363 [591] are applied.

67211 **NAME**

67212 sync ‡’schedule file system updates

67213 **SYNOPSIS**

67214 XSI
```
#include <unistd.h>
```
67215
```
void sync(void);
```

67216 **DESCRIPTION**

67217 The *sync*( ) function shall cause all information in memory that updates file systems to be
67218 scheduled for writing out to all file systems.

67219 The writing, although scheduled, is not necessarily complete upon return from *sync*( ).

67220 **RETURN VALUE**

67221 The *sync*( ) function shall not return a value.

67222 **ERRORS**

67223 No errors are defined.

67224 **EXAMPLES**

67225 None.

67226 **APPLICATION USAGE**

67227 None.

67228 **RATIONALE**

67239 **NAME**

67240 sysconf ‡'get configurable system variables

67241 **SYNOPSIS**

67242 `#include <unistd.h>`

67243 `long sysconf(int name);`

67244 **DESCRIPTION**

67245 The *sysconf*( ) function provides a method for the application to determine the current value of a
67246 configurable system limit or option (*variable*). The implementation shall support all of the
67247 variables listed in the following table and may support others.

67248 The *name* argument represents the system variable to be queried. The following table lists the
67249 minimal set of system variables from **<limits.h>** or **<unistd.h>** that can be returned by *sysconf*( ),
67250 and the symbolic constants defined in **<unistd.h>** that are the corresponding values used for
67251 *name*.

67252

RETURN VALUE

If *name* is an invalid value, *sysconf*( ) shall return −1 and set *errno* to indicate the error. If the variable corresponding to *name* is described in **<limits.h>** as a maximum or minimum value and the variable has no limit, *sysconf*( ) shall return −1 without changing the value of *errno*. Note that indefinite limits do not imply infinite limits; see **<limits.h>**.

Otherwise, *sysconf*( ) shall return the current variable value on the system. The value returned shall not be more restrictive than the corresponding value described to the application when it

was compiled with the implementation's **<limits.h>** or **<unistd.h>**. The value shall not change during the lifetime of the calling process, except that *sysconf*(_SC_OPEN_MAX) may return different values before and after a call to *setrlimit*( ) which changes the RLIMIT_NOFILE soft limit.

XSI

If the variable corresponding to *name* is dependent on an unsupported option, the results are unspecified.

ERRORS

The *sysconf*( ) function shall fail if:

[EINVAL] The value of the *name* argument is invalid.

EXAMPLES

None.

APPLICATION USAGE

As −1 is a permissible return value in a successful situation, an application wishing to check for error situations should set *errno* to 0, then call *sysconf*( ), and, if it returns −1, check to see if *errno* is non-zero.

Application developers should check whether an option, such as _POSIX_TRACE, is supported prior to obtaining and using values for related variables, such as _POSIX_TRACE_NAME_MAX.

RATIONALE

This functionality was added in response to requirements of application developers and of system vendors who deal with many international system configurations. It is closely related to *pathconf*( ) and *fpathconf*( ).

Although a conforming application can run on all systems by never demanding more resources than the minimum values published in this volume of POSIX.1-2017, it is useful for that application to be able to use the actual value for the quantity of a resource available on any given system. To do this, the application makes use of the value of a symbolic constant in **<limits.h>** or **<unistd.h>**.

However, once compiled, the application must still be able to cope if the amount of resource available is increased. To that end, an application may need a means of determining the quantity of a resource, or the presence of an option, at execution time.

Two examples are offered:

1. Applications may wish to act differently on systems with or without job control. Applications vendors who wish to distribute only a single binary package to all instances of a computer architecture would be forced to assume job control is never available if it were to rely solely on the **<unistd.h>** value published in this volume of POSIX.1-2017.
2. International applications vendors occasionally require knowledge of the number of clock ticks per second. Without these facilities, they would be required to either distribute their applications partially in source form or to have 50 Hz and 60 Hz versions for the various countries in which they operate.

It is the knowledge that many applications are actually distributed widely in executable form that leads to this facility. If limited to the most restrictive values in the headers, such applications would have to be prepared to accept the most limited environments offered by the smallest microcomputers. Although this is entirely portable, there was a consensus that they should be able to take advantage of the facilities offered by large systems, without the restrictions associated with source and object distributions.

During the discussions of this feature, it was pointed out that it is almost always possible for an

application to discern what a value might be at runtime by suitably testing the various functions themselves. And, in any event, it could always be written to adequately deal with error returns from the various functions. In the end, it was felt that this imposed an unreasonable level of complication and sophistication on the application developer.

This runtime facility is not meant to provide ever-changing values that applications have to check multiple times. The values are seen as changing no more frequently than once per system initialization, such as by a system administrator or operator with an automatic configuration program. This volume of POSIX.1-2017 specifies that they shall not change within the lifetime of the process.

Some values apply to the system overall and others vary at the file system or directory level. The latter are described in *fpathconf( )*.

Note that all values returned must be expressible as integers. String values were considered, but the additional flexibility of this approach was rejected due to its added complexity of implementation and use.

Some values, such as {PATH_MAX}, are sometimes so large that they must not be used to, say, allocate arrays. The *sysconf*( ) function returns a negative value to show that this symbolic constant is not even defined in this case.

Similar to *pathconf*( ), this permits the implementation not to have a limit. When one resource is infinite, returning an error indicating that some other resource limit has been reached is conforming behavior.

FUTURE DIRECTIONS

None.

XCU *getconf*

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

The _XBS_ variables and name values are added to the table of system variables in the DESCRIPTION. These are all marked EX.

Issue 6

The symbol CLK_TCK is obsolescent and removed. It is replaced with the phrase ``clock ticks per second''.

The symbol {PASS_MAX} is removed.

The following changes were made to align with the IEEE P1003.1a draft standard:

> Table entries are added for the following variables: _SC_REGEXP, _SC_SHELL, _SC_REGEX_VERSION, _SC_SYMLOOP_MAX.

The following *sysconf*( ) variables and their associated names are added for alignment with IEEE Std 1003.1d-1999:

67476 _POSIX_ADVISORY_INFO
67477 _POSIX_CPUTIME
67478 _POSIX_SPAWN
67479 _POSIX_SPORADIC_SERVER
67480 _POSIX_THREAD_CPUTIME
67481 _POSIX_THREAD_SPORADIC_SERVER
67482 _POSIX_TIMEOUTS

67483 The following changes are made to the DESCRIPTION for alignment with IEEE Std 1003.1j-2000:

67484 A statement expressing the dependency of support for some system variables on
67485 implementation options is added.

67486 The following system variables are added:

67487 _POSIX_BARRIERS
67488 _POSIX_CLOCK_SELECTION
67489 _POSIX_MONOTONIC_CLOCK
67490 _POSIX_READER_WRITER_LOCKS
67491 _POSIX_SPIN_LOCKS
67492 _POSIX_TYPED_MEMORY_OBJECTS

67493 The following system variables are added for alignment with IEEE Std 1003.2d-1994:

67494 _POSIX2_PBS
67495 _POSIX2_PBS_ACCOUNTING
67496 _POSIX2_PBS_LOCATE
67497 _POSIX2_PBS_MESSAGE
67498 _POSIX2_PBS_TRACK

67499 The following *sysconf*( ) variables and their associated names are added for alignment with
67500 IEEE Std 1003.1q-2000:

67501 _POSIX_TRACE
67502 _POSIX_TRACE_EVENT_FILTER
67503 _POSIX_TRACE_INHERIT
67504 _POSIX_TRACE_LOG

67505 The macros associated with the *c89* programming models are marked LEGACY, and new
67506 equivalent macros associated with *c99* are introduced.

67507 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/62 is applied, updating the
67508 DESCRIPTION to denote that the _PC* and _SC* symbols are now required to be supported. A
67509 corresponding change has been made in the Base Definitions volume of POSIX.1-2017. The
67510 deletion in the second paragraph removes some duplicated text. Additional symbols that were
67511 erroneously omitted from this reference page have been added.

67512 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/63 is applied, making it clear in the
67513 RETURN VALUE section that the value returned for *sysconf*(_SC_OPEN_MAX) may change if a
67514 call to *setrlimit*( ) adjusts the RLIMIT_NOFILE soft limit.

67515 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/134 is applied, updating the
67516 DESCRIPTION to remove an erroneous entry for _POSIX_SYMLOOP_MAX. This corrects an
67517 error in IEEE Std 1003.1-2001/Cor 1-2002.

67518 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/135 is applied, removing

_POSIX_FILE_LOCKING, _POSIX_MULTI_PROCESS, _POSIX2_C_VERSION, and _XOPEN_XCU_VERSION (and their associated _SC_* variables) from the DESCRIPTION and APPLICATION USAGE sections.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/136 is applied, adding the following constants (and their associated _SC_* variables) to the DESCRIPTION:

> _POSIX_SS_REPL_MAX
> _POSIX_TRACE_EVENT_NAME_MAX
> _POSIX_TRACE_NAME_MAX
> _POSIX_TRACE_SYS_MAX
> _POSIX_TRACE_USER_EVENT_MAX

The RETURN VALUE and APPLICATION USAGE sections are updated to note that if variables are dependent on unsupported options, the results are unspecified.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/137 is applied, removing _REGEX_VERSION and _SC_REGEX_VERSION.

Issue 7

Austin Group Interpretation 1003.1-2001 #160 is applied.

SD5-XSH-ERN-166 is applied, changing ``Maximum size'' to ``Initial size'' for the ``Maximum size of ...'' entries in the table in the DESCRIPTION.

The variables for the supported programming environments are updated to be V7 and the LEGACY variables are removed.

The following constants are added:

> _POSIX_THREAD_ROBUST_PRIO_INHERIT
> _POSIX_THREAD_ROBUST_PRIO_PROTECT

The _XOPEN_UUCP variable and its associated _SC_XOPEN_UUCP value is added to the table of system variables.

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0364 [752] is applied.

67545 **NAME**

67546 syslog ‡ log a message

67547 **SYNOPSIS**

67548 XSI
```
#include <syslog.h>

void syslog(int priority, const char *message, ... /* argument */);
```

67549

67550 **DESCRIPTION**

67551 Refer to *closelog( )*.

67552 **NAME**

67553 system ‡'issue a command

67554 **SYNOPSIS**

67555
```
#include <stdlib.h>
```

67556
```
int system(const char *command);
```

67557 **DESCRIPTION**

67558 CX The functionality described on this reference page is aligned with the ISO C standard. Any
67559 conflict between the requirements described here and the ISO C standard is unintentional. This
67560 volume of POSIX.1-2017 defers to the ISO C standard.

67561 If *command* is a null pointer, the *system*( ) function shall determine whether the host environment
67562 has a command processor. If *command* is not a null pointer, the *system*( ) function shall pass the
67563 string pointed to by *command* to that command processor to be executed in an implementation-
67564 defined manner; this might then cause the program calling *system*( ) to behave in a non-
67565 conforming manner or to terminate.

67566 CX The *system*( ) function shall behave as if a child process were created using *fork*( ), and the child
67567 process invoked the *sh* utility using *execl*( ) as follows:

67568
```
execl(<shell path>, "sh", "-c", command, (char *)0);
```

67569 where <*shell path*> is an unspecified pathname for the *sh* utility. It is unspecified whether the
67570 handlers registered with *pthread_atfork*( ) are called as part of the creation of the child process.

67571 The *system*( ) function shall ignore the SIGINT and SIGQUIT signals, and shall block the
67572 SIGCHLD signal, while waiting for the command to terminate. If this might cause the
67573 application to miss a signal that would have killed it, then the application should examine the
67574 return value from *system*( ) and take whatever action is appropriate to the application if the
67575 command terminated due to receipt of a signal.

67576 The *system*( ) function shall not affect the termination status of any child of the calling processes
67577 other than the process or processes it itself creates.

67578 The *system*( ) function shall not return until the child process has terminated.

67579 The *system*( ) function need not be thread-safe.

67580 **RETURN VALUE**

67581 If *command* is a null pointer, *system*( ) shall return non-zero to indicate that a command processor
67582 CX is available, or zero if none is available. The *system*( ) function shall always return non-zero
67583 when *command* is NULL.

67584 CX If *command* is not a null pointer, *system*( ) shall return the termination status of the command
67585 language interpreter in the format specified by *waitpid*( ). The termination status shall be as
67586 defined for the *sh* utility; otherwise, the termination status is unspecified. If some error prevents
67587 the command language interpreter from executing after the child process is created, the return
67588 value from *system*( ) shall be as if the command language interpreter had terminated using
67589 *exit*(127) or *_exit*(127). If a child process cannot be created, or if the termination status for the
67590 command language interpreter cannot be obtained, *system*( ) shall return –1 and set *errno* to
67591 indicate the error.

67592 **ERRORS**

67593 CX The *system*( ) function may set *errno* values as described by *fork*( ).

In addition, *system*( ) may fail if:

CX [ECHILD] The status of the child process created by *system*( ) is no longer available.

EXAMPLES

None.

APPLICATION USAGE

If the return value of *system*( ) is not –1, its value can be decoded through the use of the macros described in **<sys/wait.h>**. For convenience, these macros are also provided in **<stdlib.h>**.

Note that, while *system*( ) must ignore SIGINT and SIGQUIT and block SIGCHLD while waiting for the child to terminate, the handling of signals in the executed command is as specified by *fork*( ) and *exec*. For example, if SIGINT is being caught or is set to SIG_DFL when *system*( ) is called, then the child is started with SIGINT handling set to SIG_DFL.

Ignoring SIGINT and SIGQUIT in the parent process prevents coordination problems (two processes reading from the same terminal, for example) when the executed command ignores or catches one of the signals. It is also usually the correct action when the user has given a command to the application to be executed synchronously (as in the `'!'` command in many interactive applications). In either case, the signal should be delivered only to the child process, not to the application itself. There is one situation where ignoring the signals might have less than the desired effect. This is when the application uses *system*( ) to perform some task invisible to the user. If the user typed the interrupt character (`"^C"`, for example) while *system*( ) is being used in this way, one would expect the application to be killed, but only the executed command is killed. Applications that use *system*( ) in this way should carefully check the return status from *system*( ) to see if the executed command was successful, and should take appropriate action when the command fails.

Blocking SIGCHLD while waiting for the child to terminate prevents the application from catching the signal and obtaining status from *system*( )'s child process before *system*( ) can get the status itself.

The context in which the utility is ultimately executed may differ from that in which *system*( ) was called. For example, file descriptors that have the FD_CLOEXEC flag set are closed, and the process ID and parent process ID are different. Also, if the executed utility changes its environment variables or its current working directory, that change is not reflected in the caller's context.

There is no defined way for an application to find the specific path for the shell. However, *confstr*( ) can provide a value for *PATH* that is guaranteed to find the *sh* utility.

Using the *system*( ) function in more than one thread in a process or when the SIGCHLD signal is being manipulated by more than one thread in a process may produce unexpected results.

RATIONALE

The *system*( ) function should not be used by programs that have set user (or group) ID privileges. The *fork*( ) and *exec* family of functions (except *execlp*( ) and *execvp*( )), should be used instead. This prevents any unforeseen manipulation of the environment of the user that could cause execution of commands not anticipated by the calling program.

There are three levels of specification for the *system*( ) function. The ISO C standard gives the most basic. It requires that the function exists, and defines a way for an application to query whether a command language interpreter exists. It says nothing about the command language or the environment in which the command is interpreted.

POSIX.1-2017 places additional restrictions on *system*( ). It requires that if there is a command language interpreter, the environment must be as specified by *fork*( ) and *exec*. This ensures, for

example, that close-on-*exec* works, that file locks are not inherited, and that the process ID is different. It also specifies the return value from *system*( ) when the command line can be run, thus giving the application some information about the command's completion status.

Finally, POSIX.1-2017 requires the command to be interpreted as in the shell command language defined in the Shell and Utilities volume of POSIX.1-2017.

Note that, *system*(NULL) is required to return non-zero, indicating that there is a command language interpreter. At first glance, this would seem to conflict with the ISO C standard which allows *system*(NULL) to return zero. There is no conflict, however. A system must have a command language interpreter, and is non-conforming if none is present. It is therefore permissible for the *system*( ) function on such a system to implement the behavior specified by the ISO C standard as long as it is understood that the implementation does not conform to POSIX.1-2017 if *system*(NULL) returns zero.

It was explicitly decided that when *command* is NULL, *system*( ) should not be required to check to make sure that the command language interpreter actually exists with the correct mode, that there are enough processes to execute it, and so on. The call *system*(NULL) could, theoretically, check for such problems as too many existing child processes, and return zero. However, it would be inappropriate to return zero due to such a (presumably) transient condition. If some condition exists that is not under the control of this application and that would cause any *system*( ) call to fail, that system has been rendered non-conforming.

Early drafts required, or allowed, *system*( ) to return with *errno* set to [EINTR] if it was interrupted with a signal. This error return was removed, and a requirement that *system*( ) not return until the child has terminated was added. This means that if a *waitpid*( ) call in *system*( ) exits with *errno* set to [EINTR], *system*( ) must reissue the *waitpid*( ). This change was made for two reasons:

1. There is no way for an application to clean up if *system*( ) returns [EINTR], short of calling *wait*( ), and that could have the undesirable effect of returning the status of children other than the one started by *system*( ).
2. While it might require a change in some historical implementations, those implementations already have to be changed because they use *wait*( ) instead of *waitpid*( ).

Note that if the application is catching SIGCHLD signals, it will receive such a signal before a successful *system*( ) call returns.

To conform to POSIX.1-2017, *system*( ) must use *waitpid*( ), or some similar function, instead of *wait*( ).

The following code sample illustrates how *system*( ) might be implemented on an implementation conforming to POSIX.1-2017.

```
#include <signal.h>
int system(const char *cmd)
{
    int stat;
    pid_t pid;
    struct sigaction sa, savintr, savequit;
    sigset_t saveblock;
    if (cmd == NULL)
        return(1);
    sa.sa_handler = SIG_IGN;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = 0;
```

```
        sigemptyset(&savintr.sa_mask);
        sigemptyset(&savequit.sa_mask);
        sigaction(SIGINT, &sa, &savintr);
        sigaction(SIGQUIT, &sa, &savequit);
        sigaddset(&sa.sa_mask, SIGCHLD);
        sigprocmask(SIG_BLOCK, &sa.sa_mask, &saveblock);
        if ((pid = fork()) == 0) {
            sigaction(SIGINT, &savintr, (struct sigaction *)0);
            sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
            sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
            execl("/bin/sh", "sh", "-c", cmd, (char *)0);
            _exit(127);
        }
        if (pid == -1) {
            stat = -1; /* errno comes from fork() */
        } else {
            while (waitpid(pid, &stat, 0) == -1) {
                if (errno != EINTR){
                    stat = -1;
                    break;
                }
            }
        }
        sigaction(SIGINT, &savintr, (struct sigaction *)0);
        sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
        sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
        return(stat);
    }
```

Note that, while a particular implementation of *system*() (such as the one above) can assume a particular path for the shell, such a path is not necessarily valid on another system. The above example is not portable, and is not intended to be.

Note also that the above example implementation is not thread-safe. Implementations can provide a thread-safe *system*() function, but doing so involves complications such as how to restore the signal dispositions for SIGINT and SIGQUIT correctly if there are overlapping calls, and how to deal with cancellation. The example above would not restore the signal dispositions and would leak a process ID if cancelled. This does not matter for a non-thread-safe implementation since canceling a non-thread-safe function results in undefined behavior (see Section 2.9.5.2, on page 518). To avoid leaking a process ID, a thread-safe implementation would need to terminate the child process when acting on a cancellation.

One reviewer suggested that an implementation of *system*() might want to use an environment variable such as *SHELL* to determine which command interpreter to use. The supposed implementation would use the default command interpreter if the one specified by the environment variable was not available. This would allow a user, when using an application that prompts for command lines to be processed using *system*(), to specify a different command interpreter. Such an implementation is discouraged. If the alternate command interpreter did not follow the command line syntax specified in the Shell and Utilities volume of POSIX.1-2017, then changing *SHELL* would render *system*() non-conforming. This would affect applications that expected the specified behavior from *system*(), and since the Shell and Utilities volume of POSIX.1-2017 does not mention that *SHELL* affects *system*(), the application would not know that it needed to unset *SHELL*.

FUTURE DIRECTIONS

None.

67753 **NAME**

67754 tan, tanf, tanl ‡'tangent function

67755 **SYNOPSIS**

67756
```
#include <math.h>
```

67757
```
double tan(double x);
```
67758
```
float tanf(float x);
```
67759
```
long double tanl(long double x);
```

67760 **DESCRIPTION**

67761 CX The functionality described on this reference page is aligned with the ISO C standard. Any
67762 conflict between the requirements described here and the ISO C standard is unintentional. This
67763 volume of POSIX.1-2017 defers to the ISO C standard.

67764 These functions shall compute the tangent of their argument *x*, measured in radians.

67765 An application wishing to check for error situations should set *errno* to zero and call
67766 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
67767 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
67768 zero, an error has occurred.

67769 **RETURN VALUE**

67770 Upon successful completion, these functions shall return the tangent of *x*.

67771 MXX If the correct value would cause underflow, and is not representable, a range error may occur,
67772 MXX and *tan*( ), *tanf*( ), and *tanl*( ) shall return 0.0, or (if IEC 60559 Floating-Point is not supported) an
67773 implementation-defined value no greater in magnitude than DBL_MIN, FLT_MIN, and
67774 LDBL_MIN, respectively.

67775 MX If *x* is NaN, a NaN shall be returned.

67776 If *x* is ±0, *x* shall be returned.

67777 If *x* is subnormal, a range error may occur
67778 MXX and *x* should be returned.

67779 MX If *x* is not returned, *tan*( ), *tanf*( ), and *tanl*( ) shall return an implementation-defined value no
67780 greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

67781 If *x* is ±Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-
67782 defined value shall be returned.

67783 MXX If the correct value would cause underflow, and is representable, a range error may occur and
67784 the correct value shall be returned.

67785 XSI If the correct value would cause overflow, a range error shall occur and *tan*( ), *tanf*( ), and *tanl*( )
67786 shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL, respectively, with the same sign
67787 as the correct value of the function.

67788 **ERRORS**

67789 These functions shall fail if:

67790 MX Domain Error The value of *x* is ±Inf.

67791 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
67792 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
67793 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
67794 shall be raised.

67795 XSI Range Error The result overflows

67796 67797 67798 67799 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

67800 These functions may fail if:

67801 MX Range Error The result underflows, or the value of *x* is subnormal.

67802 67803 67804 67805 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

67806 **EXAMPLES**

67807 **Taking the Tangent of a 45-Degree Angle**

```
67808 #include <math.h>
67809 ...
67810 double radians = 45.0 * M_PI / 180;
67811 double result;
67812 ...
67813 result = tan (radians);
```

67814 **APPLICATION USAGE**

67815 67816 There are no known floating-point representations such that for a normal argument, *tan*(*x*) is either overflow or underflow.

67817 67818 These functions may lose accuracy when their argument is near a multiple of $\pi/2$ or is far from 0.0.

67819 67820 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/64 is applied, correcting the last paragraph in the RETURN VALUE section.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0635 [68], XSH/TC1-2008/0636 [68], and XSH/TC1-2008/0637 [68] are applied.

NAME

tanh, tanhf, tanhl ‡ hyperbolic tangent functions

SYNOPSIS

```
#include <math.h>

double tanh(double x);
float tanhf(float x);
long double tanhl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2017 defers to the ISO C standard.

These functions shall compute the hyperbolic tangent of their argument *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the hyperbolic tangent of *x*.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, *x* shall be returned.

If *x* is ±Inf, ±1 shall be returned.

If *x* is subnormal, a range error may occur
MXX and *x* should be returned.

MX If *x* is not returned, *tanh*( ), *tanhf*( ), and *tanhl*( ) shall return an implementation-defined value no greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

ERRORS

These functions may fail if:

MX Range Error — The value of *x* is subnormal.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

67888 **CHANGE HISTORY**

67889 First released in Issue 1. Derived from Issue 1 of the SVID.

67890 **Issue 5**

67891 The DESCRIPTION is updated to indicate how an application should check for an error. This
67892 text was previously published in the APPLICATION USAGE section.

67893 **Issue 6**

67894 The *tanhf*( ) and *tanhl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

67895 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
67896 revised to align with the ISO/IEC 9899:1999 standard.

67897 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
67898 marked.

67899 **Issue 7**

67900 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0638 [68] is applied.

67901 **NAME**

67902 tanl ‡'tangent function

67903 **SYNOPSIS**

67904 `#include <math.h>`

67905 `long double tanl(long double x);`

67906 **DESCRIPTION**

67907 Refer to *tan( )*.

67908 **NAME**

67909 tcdrain ‡'wait for transmission of output

67910 **SYNOPSIS**

67911 `#include <termios.h>`

67912 `int tcdrain(int fildes);`

67913 **DESCRIPTION**

67914 The *tcdrain*( ) function shall block until all output written to the object referred to by *fildes* is
67915 transmitted. The *fildes* argument is an open file descriptor associated with a terminal.

67916 Any attempts to use *tcdrain*( ) from a process which is a member of a background process group
67917 on a *fildes* associated with its controlling terminal, shall cause the process group to be sent a
67918 SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring
67919 SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

67920 **RETURN VALUE**

67921 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
67922 indicate the error.

67923 **ERRORS**

67924 The *tcdrain*( ) function shall fail if:

67925 [EBADF] The *fildes* argument is not a valid file descriptor.

67926 [EINTR] A signal interrupted *tcdrain*( ).

67927 [EIO] The process group of the writing process is orphaned, the calling thread is not
67928 blocking SIGTTOU, and the process is not ignoring SIGTTOU.

67929 [ENOTTY] The file associated with *fildes* is not a terminal.

67941 **CHANGE HISTORY**

67942 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

In the DESCRIPTION, the final paragraph is no longer conditional on _POSIX_JOB_CONTROL. This is a FIPS requirement.

The [EIO] error is added.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0639 [79], XSH/TC1-2008/0640 [79], and XSH/TC1-2008/0641 [79] are applied.

67952 **NAME**

67953 tcflow — suspend or restart the transmission or reception of data

67954 **SYNOPSIS**

67955 ```
#include <termios.h>
```

67956 ```
int tcflow(int fildes, int action);
```

67957 **DESCRIPTION**

67958 The *tcflow*( ) function shall suspend or restart transmission or reception of data on the object
67959 referred to by *fildes*, depending on the value of *action*. The *fildes* argument is an open file
67960 descriptor associated with a terminal.

67961 If *action* is TCOOFF, output shall be suspended.

67962 If *action* is TCOON, suspended output shall be restarted.

67963 If *action* is TCIOFF and *fildes* refers to a terminal device, the system shall transmit a STOP
67964 character, which is intended to cause the terminal device to stop transmitting data to the
67965 system. If *fildes* is associated with a pseudo-terminal, the STOP character need not be
67966 transmitted.

67967 If *action* is TCION and *fildes* refers to a terminal device, the system shall transmit a START
67968 character, which is intended to cause the terminal device to start transmitting data to the
67969 system. If *fildes* is associated with a pseudo-terminal, the START character need not be
67970 transmitted.

67971 The default on the opening of a terminal file is that neither its input nor its output are
67972 suspended.

67973 Attempts to use *tcflow*( ) from a process which is a member of a background process group on a
67974 *fildes* associated with its controlling terminal, shall cause the process group to be sent a
67975 SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring
67976 SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

67977 **RETURN VALUE**

67978 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
67979 indicate the error.

67980 **ERRORS**

67981 The *tcflow*( ) function shall fail if:

67982 [EBADF] The *fildes* argument is not a valid file descriptor.

67983 [EINVAL] The *action* argument is not a supported value.

67984 [EIO] The process group of the writing process is orphaned, the calling thread is not
67985 blocking SIGTTOU, and the process is not ignoring SIGTTOU.

67986 [ENOTTY] The file associated with *fildes* is not a terminal.

67987 **EXAMPLES**

67988 None.

67989 **APPLICATION USAGE**

67990 None.

67991 **RATIONALE**

67992 None.

68000 **Issue 6**

68001 The following new requirements on POSIX implementations derive from alignment with the
68002 Single UNIX Specification:

68003 The [EIO] error is added.

68004 **Issue 7**

68005 SD5-XSH-ERN-190 is applied, clarifying in the DESCRIPTION the transmission of START and
68006 STOP characters.

68007 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0642 [79], XSH/TC1-2008/0643 [79],
68008 and XSH/TC1-2008/0644 [79] are applied.

68009 **NAME**

68010 tcflush — flush non-transmitted output data, non-read input data, or both

68011 **SYNOPSIS**

68012 `#include <termios.h>`

68013 `int tcflush(int fildes, int queue_selector);`

68014 **DESCRIPTION**

68015 Upon successful completion, *tcflush*( ) shall discard data written to the object referred to by *fildes*
68016 (an open file descriptor associated with a terminal) but not transmitted, or data received but not
68017 read, depending on the value of *queue_selector*:

68018 If *queue_selector* is TCIFLUSH, it shall flush data received but not read.

68019 If *queue_selector* is TCOFLUSH, it shall flush data written but not transmitted.

68020 If *queue_selector* is TCIOFLUSH, it shall flush both data received but not read and data
68021 written but not transmitted.

68022 Attempts to use *tcflush*( ) from a process which is a member of a background process group on a
68023 *fildes* associated with its controlling terminal shall cause the process group to be sent a SIGTTOU
68024 signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring SIGTTOU
68025 signals, the process shall be allowed to perform the operation, and no signal is sent.

68026 **RETURN VALUE**

68027 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
68028 indicate the error.

68029 **ERRORS**

68030 The *tcflush*( ) function shall fail if:

68031 [EBADF] The *fildes* argument is not a valid file descriptor.

68032 [EINVAL] The *queue_selector* argument is not a supported value.

68033 [EIO] The process group of the writing process is orphaned, the calling thread is not
68034 blocking SIGTTOU, and the process is not ignoring SIGTTOU.

68035 [ENOTTY] The file associated with *fildes* is not a terminal.

68047 **CHANGE HISTORY**

68048 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The Open Group Corrigendum U035/1 is applied. In the ERRORS and APPLICATION USAGE sections, references to *tcflow*( ) are replaced with *tcflush*( ).

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

> In the DESCRIPTION, the final paragraph is no longer conditional on _POSIX_JOB_CONTROL. This is a FIPS requirement.
>
> The [EIO] error is added.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0645 [79], XSH/TC1-2008/0646 [79], and XSH/TC1-2008/0647 [79] are applied.

68060 **NAME**

68061 tcgetattr ‡'get the parameters associated with the terminal

68062 **SYNOPSIS**

68063 `#include <termios.h>`

68064 `int tcgetattr(int fildes, struct termios *termios_p);`

68065 **DESCRIPTION**

68066 The *tcgetattr*( ) function shall get the parameters associated with the terminal referred to by *fildes*
68067 and store them in the **termios** structure referenced by *termios_p*. The *fildes* argument is an open
68068 file descriptor associated with a terminal.

68069 The *termios_p* argument is a pointer to a **termios** structure.

68070 The *tcgetattr*( ) operation is allowed from any process.

68071 If the terminal device supports different input and output baud rates, the baud rates stored in
68072 the **termios** structure returned by *tcgetattr*( ) shall reflect the actual baud rates, even if they are
68073 equal. If differing baud rates are not supported, the rate returned as the output baud rate shall
68074 be the actual baud rate. If the terminal device does not support split baud rates, the input baud
68075 rate stored in the **termios** structure shall be the output rate (as one of the symbolic values).

68076 **RETURN VALUE**

68077 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
68078 indicate the error.

68079 **ERRORS**

68080 The *tcgetattr*( ) function shall fail if:

68081 [EBADF] The *fildes* argument is not a valid file descriptor.

68082 [ENOTTY] The file associated with *fildes* is not a terminal.

68083 **EXAMPLES**

68084 None.

68085 **APPLICATION USAGE**

68086 None.

68087 **RATIONALE**

68088 Care must be taken when changing the terminal attributes. Applications should always do a
68089 *tcgetattr*( ), save the **termios** structure values returned, and then do a *tcsetattr*( ), changing only
68090 the necessary fields. The application should use the values saved from the *tcgetattr*( ) to reset the
68091 terminal state whenever it is done with the terminal. This is necessary because terminal
68092 attributes apply to the underlying port and not to each individual open instance; that is, all
68093 processes that have used the terminal see the latest attribute changes.

68094 A program that uses these functions should be written to catch all signals and take other
68095 appropriate actions to ensure that when the program terminates, whether planned or not, the
68096 terminal device's state is restored to its original state.

68097 Existing practice dealing with error returns when only part of a request can be honored is based
68098 on calls to the *ioctl*( ) function. In historical BSD and System V implementations, the
68099 corresponding *ioctl*( ) returns zero if the requested actions were semantically correct, even if
68100 some of the requested changes could not be made. Many existing applications assume this
68101 behavior and would no longer work correctly if the return value were changed from zero to –1
68102 in this case.

68103 Note that either specification has a problem. When zero is returned, it implies everything

succeeded even if some of the changes were not made. When −1 is returned, it implies everything failed even though some of the changes were made.

Applications that need all of the requested changes made to work properly should follow *tcsetattr*( ) with a call to *tcgetattr*( ) and compare the appropriate field values.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the DESCRIPTION, the rate returned as the input baud rate shall be the output rate. Previously, the number zero was also allowed but was obsolescent.

68118 **NAME**

68119 tcgetpgrp — get the foreground process group ID

68120 **SYNOPSIS**

68121 ```
#include <unistd.h>
```

68122 ```
pid_t tcgetpgrp(int fildes);
```

68123 **DESCRIPTION**

68124 The *tcgetpgrp*( ) function shall return the value of the process group ID of the foreground process
68125 group associated with the terminal.

68126 If there is no foreground process group, *tcgetpgrp*( ) shall return a value greater than 1 that does
68127 not match the process group ID of any existing process group.

68128 The *tcgetpgrp*( ) function is allowed from a process that is a member of a background process
68129 group; however, the information may be subsequently changed by a process that is a member of
68130 a foreground process group.

68131 **RETURN VALUE**

68132 Upon successful completion, *tcgetpgrp*( ) shall return the value of the process group ID of the
68133 foreground process associated with the terminal. Otherwise, –1 shall be returned and *errno* set to
68134 indicate the error.

68135 **ERRORS**

68136 The *tcgetpgrp*( ) function shall fail if:

68137 [EBADF] The *fildes* argument is not a valid file descriptor.

68138 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the
68139 controlling terminal.

68140 **EXAMPLES**

68141 None.

68142 **APPLICATION USAGE**

68143 None.

68144 **RATIONALE**

68145 None.

68150 XBD **<sys/types.h>**, **<unistd.h>**

68151 **CHANGE HISTORY**

68152 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

68153 **Issue 6**

68154 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

68155 The following new requirements on POSIX implementations derive from alignment with the
68156 Single UNIX Specification:

68157 The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
68158 required for conforming implementations of previous POSIX specifications, it was not
68159 required for UNIX applications.

In the DESCRIPTION, text previously conditional on support for _POSIX_JOB_CONTROL is now mandatory. This is a FIPS requirement.

68162 **NAME**

68163 tcgetsid — get the process group ID for the session leader for the controlling terminal

68164 **SYNOPSIS**

68165 ```
#include <termios.h>
```

68166 ```
pid_t tcgetsid(int fildes);
```

68167 **DESCRIPTION**

68168 The *tcgetsid*( ) function shall obtain the process group ID of the session for which the terminal
68169 specified by *fildes* is the controlling terminal.

68170 **RETURN VALUE**

68171 Upon successful completion, *tcgetsid*( ) shall return the process group ID of the session
68172 associated with the terminal. Otherwise, a value of –1 shall be returned and *errno* set to indicate
68173 the error.

68174 **ERRORS**

68175 The *tcgetsid*( ) function shall fail if:

68176 [EBADF] The *fildes* argument is not a valid file descriptor.

68177 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the
68178 controlling terminal.

68191 **Issue 5**

68192 Moved from X/OPEN UNIX extension to BASE.

68193 The [EACCES] error has been removed from the list of mandatory errors, and the description of
68194 [ENOTTY] has been reworded.

68195 **Issue 7**

68196 SD5-XSH-ERN-180 is applied, clarifying the RETURN VALUE section.

68197 The *tcgetsid*( ) function is moved from the XSI option to the Base.

68198 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0648 [421] is applied.

NAME

tcsendbreak — send a break for a specific duration

SYNOPSIS

```
#include <termios.h>

int tcsendbreak(int fildes, int duration);
```

DESCRIPTION

If the terminal is using asynchronous serial data transmission, *tcsendbreak*( ) shall cause transmission of a continuous stream of zero-valued bits for a specific duration. If *duration* is 0, it shall cause transmission of zero-valued bits for at least 0.25 seconds, and not more than 0.5 seconds. If *duration* is not 0, it shall send zero-valued bits for an implementation-defined period of time.

The *fildes* argument is an open file descriptor associated with a terminal.

If the terminal is not using asynchronous serial data transmission, it is implementation-defined whether *tcsendbreak*( ) sends data to generate a break condition or returns without taking any action.

Attempts to use *tcsendbreak*( ) from a process which is a member of a background process group on a *fildes* associated with its controlling terminal shall cause the process group to be sent a SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *tcsendbreak*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[EIO] The process group of the writing process is orphaned, the calling thread is not blocking SIGTTOU, and the process is not ignoring SIGTTOU.

[ENOTTY] The file associated with *fildes* is not a terminal.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

In the DESCRIPTION, text previously conditional on _POSIX_JOB_CONTROL is now mandated. This is a FIPS requirement.

The [EIO] error is added.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0649 [79], XSH/TC1-2008/0650 [79], and XSH/TC1-2008/0651 [79] are applied.

68248 **NAME**

68249 tcsetattr ‡'set the parameters associated with the terminal

68250 **SYNOPSIS**

68251 ```
#include <termios.h>
```

68252 ```
int tcsetattr(int fildes, int optional_actions,
```
68253 ```
    const struct termios *termios_p);
```

68254 **DESCRIPTION**

68255 The *tcsetattr*( ) function shall set the parameters associated with the terminal referred to by the
68256 open file descriptor *fildes* (an open file descriptor associated with a terminal) from the **termios**
68257 structure referenced by *termios_p* as follows:

68258 If *optional_actions* is TCSANOW, the change shall occur immediately.

68259 If *optional_actions* is TCSADRAIN, the change shall occur after all output written to *fildes* is
68260 transmitted. This function should be used when changing parameters that affect output.

68261 If *optional_actions* is TCSAFLUSH, the change shall occur after all output written to *fildes* is
68262 transmitted, and all input so far received but not read shall be discarded before the change
68263 is made.

68264 If the output baud rate stored in the **termios** structure pointed to by *termios_p* is the zero baud
68265 rate, B0, the modem control lines shall no longer be asserted. Normally, this shall disconnect the
68266 line.

68267 If the input baud rate stored in the **termios** structure pointed to by *termios_p* is 0, the input baud
68268 rate given to the hardware is the same as the output baud rate stored in the **termios** structure.

68269 The *tcsetattr*( ) function shall return successfully if it was able to perform any of the requested
68270 actions, even if some of the requested actions could not be performed. It shall set all the
68271 attributes that the implementation supports as requested and leave all the attributes not
68272 supported by the implementation unchanged. If no part of the request can be honored, it shall
68273 return −1 and set *errno* to [EINVAL]. If the input and output baud rates differ and are a
68274 combination that is not supported, neither baud rate shall be changed. A subsequent call to
68275 *tcgetattr*( ) shall return the actual state of the terminal device (reflecting both the changes made
68276 and not made in the previous *tcsetattr*( ) call). The *tcsetattr*( ) function shall not change the values
68277 found in the **termios** structure under any circumstances.

68278 The effect of *tcsetattr*( ) is undefined if the value of the **termios** structure pointed to by *termios_p*
68279 was not derived from the result of a call to *tcgetattr*( ) on *fildes*; an application should modify
68280 only fields and flags defined by this volume of POSIX.1-2017 between the call to *tcgetattr*( ) and
68281 *tcsetattr*( ), leaving all other fields and flags unmodified.

68282 No actions defined by this volume of POSIX.1-2017, other than a call to *tcsetattr*( ), a close of the
68283 last file descriptor in the system associated with this terminal device, or an open of the first file
68284 descriptor in the system associated with this terminal device (using the O_TTY_INIT flag if it is
68285 non-zero and the device is not a pseudo-terminal), shall cause any of the terminal attributes
68286 defined by this volume of POSIX.1-2017 to change.

68287 If *tcsetattr*( ) is called from a process which is a member of a background process group on a *fildes*
68288 associated with its controlling terminal:

68289 If the calling thread is blocking SIGTTOU signals or the process is ignoring SIGTTOU
68290 signals, the operation completes normally and no signal is sent.

  
```

Otherwise, a SIGTTOU signal shall be sent to the process group.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *tcsetattr*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[EINTR] A signal interrupted *tcsetattr*( ).

[EINVAL] The *optional_actions* argument is not a supported value, or an attempt was made to change an attribute represented in the **termios** structure to an unsupported value.

[EIO] The process group of the writing process is orphaned, the calling thread is not blocking SIGTTOU, and the process is not ignoring SIGTTOU.

[ENOTTY] The file associated with *fildes* is not a terminal.

EXAMPLES

None.

APPLICATION USAGE

If trying to change baud rates, applications should call *tcsetattr*( ) then call *tcgetattr*( ) in order to determine what baud rates were actually selected.

In general, there are two reasons for an application to change the parameters associated with a terminal device:

1. The device already has working parameter settings but the application needs a different behavior, such as non-canonical mode instead of canonical mode. The application sets (or clears) only a few flags or *c_cc*[ ] values. Typically, the terminal device in this case is either the controlling terminal for the process or a pseudo-terminal.

2. The device is a modem or similar piece of equipment connected by a serial line, and it was not open before the application opened it. In this case, the application needs to initialize all of the parameter settings ``from scratch''. However, since the **termios** structure may include both standard and non-standard parameters, the application cannot just initialize the whole structure in an arbitrary way (e.g., using *memset*( )) as this may cause some of the non-standard parameters to be set incorrectly, resulting in non-conforming behavior of the terminal device. Conversely, the application cannot just set the standard parameters, assuming that the non-standard parameters will already have suitable values, as the device might previously have been used with non-conforming parameter settings (and some implementations retain the settings from one use to the next). The solution is to open the terminal device using the O_TTY_INIT flag to initialize the terminal device to have conforming parameter settings, obtain those settings using *tcgetattr*( ), and then set all of the standard parameters to the desired settings.

RATIONALE

The *tcsetattr*( ) function can be interrupted in the following situations:

It is interrupted while waiting for output to drain.

It is called from a process in a background process group and SIGTTOU is caught.

See also the RATIONALE section in *tcgetattr*( ).

FUTURE DIRECTIONS

Using an input baud rate of 0 to set the input rate equal to the output rate may not necessarily be supported in a future version of this volume of POSIX.1-2017.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

In the DESCRIPTION, text previously conditional on _POSIX_JOB_CONTROL is now mandated. This is a FIPS requirement.

The [EIO] error is added.

In the DESCRIPTION, the text describing use of *tcsetattr*( ) from a process which is a member of a background process group is clarified.

Issue 7

Austin Group Interpretation 1003.1-2001 #144 is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0652 [79], XSH/TC1-2008/0653 [79], and XSH/TC1-2008/0654 [79] are applied.

68354 **NAME**

68355 tcsetpgrp — set the foreground process group ID

68356 **SYNOPSIS**

68357 `#include <unistd.h>`

68358 `int tcsetpgrp(int fildes, pid_t pgid_id);`

68359 **DESCRIPTION**

68360 If the process has a controlling terminal, *tcsetpgrp*( ) shall set the foreground process group ID
68361 associated with the terminal to *pgid_id*. The application shall ensure that the file associated with
68362 *fildes* is the controlling terminal of the calling process and the controlling terminal is currently
68363 associated with the session of the calling process. The application shall ensure that the value of
68364 *pgid_id* matches a process group ID of a process in the same session as the calling process.

68365 Attempts to use *tcsetpgrp*( ) from a process which is a member of a background process group on
68366 a *fildes* associated with its controlling terminal shall cause the process group to be sent a
68367 SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring
68368 SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

68369 **RETURN VALUE**

68370 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
68371 indicate the error.

68372 **ERRORS**

68373 The *tcsetpgrp*( ) function shall fail if:

68374 [EBADF] The *fildes* argument is not a valid file descriptor.

68375 [EINVAL] This implementation does not support the value in the *pgid_id* argument.

68376 [EIO] The process group of the writing process is orphaned, the calling thread is not
68377 blocking SIGTTOU, and the process is not ignoring SIGTTOU.

68378 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the
68379 controlling terminal, or the controlling terminal is no longer associated with
68380 the session of the calling process.

68381 [EPERM] The value of *pgid_id* is a value supported by the implementation, but does not
68382 match the process group ID of a process in the same session as the calling
68383 process.

68392 **SEE ALSO**

68393 *tcgetpgrp*( )

68394 XBD **<sys/types.h>**, **<unistd.h>**

68395 **CHANGE HISTORY**

68396 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

68397 **Issue 6**

68398 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

68399 The following new requirements on POSIX implementations derive from alignment with the
68400 Single UNIX Specification:

68401 The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
68402 required for conforming implementations of previous POSIX specifications, it was not
68403 required for UNIX applications.

68404 In the DESCRIPTION and ERRORS sections, text previously conditional on
68405 _POSIX_JOB_CONTROL is now mandated. This is a FIPS requirement.

68406 The normative text is updated to avoid use of the term ``must'' for application requirements.

68407 The Open Group Corrigendum U047/4 is applied.

68408 **Issue 7**

68409 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0655 [79] and XSH/TC1-2008/0656
68410 [79] are applied.

68411 **NAME**

68412 tdelete, tfind, tsearch, twalk — manage a binary search tree

68413 **SYNOPSIS**

68414 XSI
```
#include <search.h>

void *tdelete(const void *restrict key, void **restrict rootp,
    int(*compar)(const void *, const void *));
void *tfind(const void *key, void *const *rootp,
    int(*compar)(const void *, const void *));
void *tsearch(const void *key, void **rootp,
    int (*compar)(const void *, const void *));
void twalk(const void *root,
    void (*action)(const void *, VISIT, int));
```

68423 **DESCRIPTION**

68424 The *tdelete*( ), *tfind*( ), *tsearch*( ), and *twalk*( ) functions manipulate binary search trees.
68425 Comparisons are made with a user-supplied routine, the address of which is passed as the
68426 *compar* argument. This routine is called with two arguments, which are the pointers to the
68427 elements being compared. The application shall ensure that the user-supplied routine returns an
68428 integer less than, equal to, or greater than 0, according to whether the first argument is to be
68429 considered less than, equal to, or greater than the second argument. The comparison function
68430 need not compare every byte, so arbitrary data may be contained in the elements in addition to
68431 the values being compared.

68432 The *tsearch*( ) function shall build and access the tree. The *key* argument is a pointer to an element
68433 to be accessed or stored. If there is a node in the tree whose element is equal to the value pointed
68434 to by *key*, a pointer to this found node shall be returned. Otherwise, the value pointed to by *key*
68435 shall be inserted (that is, a new node is created and the value of *key* is copied to this node), and a
68436 pointer to this node returned. Only pointers are copied, so the application shall ensure that the
68437 calling routine stores the data. The *rootp* argument points to a variable that points to the root
68438 node of the tree. A null pointer value for the variable pointed to by *rootp* denotes an empty tree;
68439 in this case, the variable shall be set to point to the node which shall be at the root of the new
68440 tree.

68441 Like *tsearch*( ), *tfind*( ) shall search for a node in the tree, returning a pointer to it if found.
68442 However, if it is not found, *tfind*( ) shall return a null pointer. The arguments for *tfind*( ) are the
68443 same as for *tsearch*( ).

68444 The *tdelete*( ) function shall delete a node from a binary search tree. The arguments are the same
68445 as for *tsearch*( ). The variable pointed to by *rootp* shall be changed if the deleted node was the
68446 root of the tree. If the deleted node was the root of the tree and had no children, the variable
68447 pointed to by *rootp* shall be set to a null pointer. The *tdelete*( ) function shall return a pointer to
68448 the parent of the deleted node, or an unspecified non-null pointer if the deleted node was the
68449 root node, or a null pointer if the node is not found.

68450 If *tsearch*( ) adds an element to a tree, or *tdelete*( ) successfully deletes an element from a tree, the
68451 concurrent use of that tree in another thread, or use of pointers produced by a previous call to
68452 *tfind*( ) or *tsearch*( ), produces undefined results.

68453 The *twalk*( ) function shall traverse a binary search tree. The *root* argument is a pointer to the root
68454 node of the tree to be traversed. (Any node in a tree may be used as the root for a walk below
68455 that node.) The argument *action* is the name of a routine to be invoked at each node. This routine
68456 is, in turn, called with three arguments. The first argument shall be the address of the node being
68457 visited. The structure pointed to by this argument is unspecified and shall not be modified by

the application, but it shall be possible to cast a pointer-to-node into a pointer-to-pointer-to-element to access the element stored in the node. The second argument shall be a value from an enumeration data type:

```
typedef enum { preorder, postorder, endorder, leaf } VISIT;
```

(defined in **<search.h>**), depending on whether this is the first, second, or third time that the node is visited (during a depth-first, left-to-right traversal of the tree), or whether the node is a leaf. The third argument shall be the level of the node in the tree, with the root being level 0.

If the calling function alters the pointer to the root, the result is undefined.

If the functions pointed to by *action* or *compar* (for any of these binary search functions) change the tree, the results are undefined.

These functions are thread-safe only as long as multiple threads do not access the same tree.

RETURN VALUE

If the node is found, both *tsearch*( ) and *tfind*( ) shall return a pointer to it. If not, *tfind*( ) shall return a null pointer, and *tsearch*( ) shall return a pointer to the inserted item.

A null pointer shall be returned by *tsearch*( ) if there is not enough space available to create a new node.

A null pointer shall be returned by *tdelete*( ), *tfind*( ), and *tsearch*( ) if *rootp* is a null pointer on entry.

The *tdelete*( ) function shall return a pointer to the parent of the deleted node, or an unspecified non-null pointer if the deleted node was the root node, or a null pointer if the node is not found.

The *twalk*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

The following code reads in strings and stores structures containing a pointer to each string and a count of its length. It then walks the tree, printing out the stored strings and their lengths in alphabetical order.

```
#include <limits.h>
#include <search.h>
#include <stdlib.h>
#include <string.h>
#include <stdio.h>

struct element {      /* Pointers to these are stored in the tree. */
    int     count;
    char    string[];
};

void  *root = NULL;          /* This points to the root. */

int main(void)
{
    char   str[_POSIX2_LINE_MAX+1];
    int    length = 0;
    struct element *elementptr;
    void   *node;
    void   print_node(const void *, VISIT, int);
```

```
68502           int    node_compare(const void *, const void *),
68503                  delete_root(const void *, const void *);
68504           while (fgets(str, sizeof(str), stdin))  {
68505               /* Set element. */
68506               length = strlen(str);
68507               if (str[length-1] == '\n')
68508                   str[--length] = '\0';
68509               elementptr = malloc(sizeof(struct element) + length + 1);
68510               strcpy(elementptr->string, str);
68511               elementptr->count = 1;
68512               /* Put element into the tree. */
68513               node = tsearch((void *)elementptr, &root, node_compare);
68514               if (node == NULL) {
68515                   fprintf(stderr,
68516                           "tsearch: Not enough space available\n");
68517                   exit(EXIT_FAILURE);
68518               }
68519               else if (*(struct element **)node != elementptr) {
68520                   /* A node containing the element already exists */
68521                   (*(struct element **)node)->count++;
68522                   free(elementptr);
68523               }
68524           }
68525           twalk(root, print_node);
68526           /* Delete all nodes in the tree */
68527           while (root != NULL) {
68528               elementptr = *(struct element **)root;
68529               printf("deleting node: string = %s,  count = %d\n",
68530                      elementptr->string,
68531                      elementptr->count);
68532               tdelete((void *)elementptr, &root, delete_root);
68533               free(elementptr);
68534           }
68535           return 0;
68536       }
68537       /*
68538        *  This routine compares two nodes, based on an
68539        *  alphabetical ordering of the string field.
68540        */
68541       int
68542       node_compare(const void *node1, const void *node2)
68543       {
68544           return strcmp(((const struct element *) node1)->string,
68545               ((const struct element *) node2)->string);
